A Question of Freedom and Slavery

"I consider it as nothing less than a question of freedom or slavery.... Should I keep back my opinions at such a time, through fear of giving offense, I should consider myself as guilty of treason towards my country, and of an act of disloyalty towards the majesty of heaven, which I revere above all earthly kings."

Patrick Henry
March 23, 1775

A Deliberate & Systematical Plan of Slavery

"Single acts of tyranny may be ascribed to the accidental opinion of a day; but a series of oppressions, begun at a distinguished period, and pursued unalterably through every change of ministers, too plainly prove a deliberate, systematical plan of reducing us to slavery."

Thomas Jefferson
August, 1774

Dedication

This trilogy is respectively dedicated to James Madison, Thomas Jefferson, Andrew Jackson and Abraham Lincoln. Their fierce devotion to the principles of freedom and liberty was unequivocal, relentless and exemplary. Their dedication to the principles of a constitutional monetary system was unparalleled the history of the Republic. Their unwavering courage and steadfast opposition to the elite financial oligarchies in their respective days has earned them the adoration and praise of true patriots forever. The last of these noble and great men gave the last full measure of his devotion to America and its free institutions – even his life in the ongoing war between the forces of freedom and tyranny.

This trilogy is also dedicated to the courageous men and women of the 19th and 20th centuries who opposed the elite financial oligarchies in their day.

Table of Contents

Appendix A

Appendix 1 Billionaires Throughout the World

1. Foreign Billionaires
2. American Billionaires

Appendix 2 Major Corporations Throughout the World

1. 50 Largest Corporations in the World
2. 25 Largest Public Foreign Companies
3. Countries with the Most Companies
4. Biggest Companies in World by Industry
5. World's Largest Industrial Corporations
6. World's Largest 100 Banks by Assets
7. World's Largest Corporations by Country
8. Europe's 100 Largest Fund Managers
9. America's Leading Investment Houses
10. America's Biggest Brokers
11. America's 100 Largest Multinational Corporations
12. Leading Commercial Banks in Foreign Exchange Market
13. America's Leading Merger & Acquisition Specialists
14. America's Leading Corporate Underwriters
15. America's 800 Most Powerful People
16. America's 500 Largest Industrial Corporations
17. America's 500 Largest Private Companies
18. America's 100 Largest Foreign Investments in the U.S.

Appendix 3 Interviews with Influential Leaders in U.S., Europe and Japan

1. David Rockefeller
2. A. W. Clausen
3. William McChesney Martin
4. Henry Fowler
5. Yves Andre Istel
6. Michael David Weille
7. Leland S. Prussia
8. Frank X. Stankard
9. David Rockefeller, Takeshi Watanabe and Georges Berthoin
10. George Franklin - Part I
11. George Franklin - Part II
12. John Temple Swing
13. Winston Lord
14. Joseph E. Slater
15. Martin J. Hillenbrand
16. Joseph E. Johnson
17. William P. Bundy
18. George Ball
19. Ernest H. Vander Beugal
20. Richard Burke
21. Carter L. Burgess
22. Karl Kaiser
23. David Watt
24. Theodore C. Achilles

25. Francis O. Wilcox
26. Christoph Bertram
27. Dianne Hayter
28. John F. Reichard
29. Braulio Alonzo
30. Joseph Standa
31. John Ryor
32. Jim Cochran
33. World of David Rockefeller – Excerpts from Interview with Bill Moyers

Appendix 4 Central Banks of the World

Appendix 5 International Organizations

1. Membership of the U.N. and Its Specialized Agencies

Appendix 6 Charter of the United Nations

Appendix 7 U. S. Contributions to U.N. Organization – 1994

Appendix 8 U. S. Government Securities Dealers

Appendix 9 Directors of International Institutions

1. Managing Directors of the IMF
2. Directors General of the GATT/WTO
3. Presidents of IBRD
4. Presidents of BIS

Appendix 10 Economic Summit Declarations

1. Chateau de Rambouillet, France
2. Puerto Rico
3. London, England

4. Bonn, Germany
5. Tokyo, Japan
6. Venice, Italy
7. Ottawa, Canada
8. Versailles, France
9. Williamsburg, VA, USA
10. London, England
11. Bonn, Germany
12. Tokyo, Japan
13. Venice, Italy
14. Toronto, Canada
15. Paris, France
16. Houston, TX, USA
17. London, England
18. Munich, Germany
19. Tokyo, Japan
20. Naples, Italy
21. Halifax, Nova Scotia

Appendix 11 Trilateral Commission Leadership and Membership

1. Trilateral Commission Leadership and Membership – October 15, 1978
2. Trilateral Commission Leadership and Membership – October 15, 1982
3. Trilateral Commission Leadership and Membership – 1995

Appendix 12 The Bilderberg Meetings

1. John Pomain – The Origin of the Bilderberg Meetings

2. Dr. Joseph H. Retinger – Bilderberg Meetings
3. Alden Hatch – The Hotel de Bilderberg
4. List of Bilderberg Meetings Throughout the World
5. Bilderberg Discussion Papers
6. Graham T. Allison – Young Americans' Attitudes Toward Foreign Policy
7. Karl Kaiser – Priorities in Foreign Policy

Part I Preface

i. The Doctrines of Machiavellianism Permeate the World of Business and Society

**By
Ida M. Tarbell**

Some four hundred years ago there was living quietly in a little villa not far from the City of Florence Italy, a man about forty-five years old, Niccolo Machiavelli by name. His serious occupation – followed at night after a day spent in superintending his estate and drinking wine with his rustic neighbors – was writing a treatise explaining how, in his judgment, the then existing government of Florence could bring that city back to a power and glory which it had lost. Signor Machiavelli was very well fitted for his task. He was not a scholar, in the strict sense of the term, but he was a man thoroughly familiar with his world. He knew its literature and its history. He was an able writer, perhaps the first prose writer Italy had ever produced. He was a man of large experience in politics, diplomacy, society. For fifteen years before taking to his little villa he had been the private secretary and confidential agent of the most powerful factor in the Florentine Republic – the Council of Ten, and in this position he had seen from the inside some of the most extraordinary events of the period. He had been with Cesare Borgia when that crafty general, having lured a large number of his enemies to a conference to discuss terms of peace, cut off their heads – for the good of his country! He had passed months at the court of Francis I, one of the greatest of French Medieval sovereigns, begging men and money to help Florence keep off her enemies. He had matched cunning with cunning; deceit with deceit, bullying with bullying, logic and logic in the leading diplomatic circles of Europe. He was a man of his world, too, always in the thick of the cleverest circle of his city, gossiping, carousing, agitating. He could run an enemy through with a sword, if need be; he could play the gallant with the best of them; he could turn a sonnet to suit the critical taste of his day; and he could write a pamphlet or a creed for the city gate as no other man in Florence. In short, Machiavelli was a versatile, brilliant, learned man of his times – but he was something more than most of such gentlemen, of whom Florence had many. He had a mind of extraordinary analytical power, a genius for construction, a warm devotion to his native city, and a patriotic passion for her glory.

Machiavelli Teaches Despots How to Make Themselves Impregnable

Signor Machiavelli was altogether too young and too much in love with life and action to be spending his nights in writing a treatise on government if he could have helped himself. But he could not. He had lost his office by the overthrow of the Republic of Florence and the restoration of the old despotic power of the Medici. Machiavelli saw no chance for a restoration of the republic. But he

believed he did see the way for an able Despot to make Florence all powerful in Italy. He decided to explain his views to the Medici. The world has always been divided as to why Machiavelli, a Republican and practically an exile because of his principles, should have attempted to teach a Despot how to make himself impregnable and his state glorious. There are those who say it was that he might be restored to place – and certainly Machiavelli, when he came to offer his treatise to the Medici, offered his services along with it, pleading that the work itself proved his fitness to serve a Despot, – which it certainly did; but there was a great deal more than a desire for a position in Machiavelli's mind. He loved his Florence – ardently, passionately desired her glory. He saw no chance for the success of a Republic. He believed a powerful and wise Despot could make a state glorious and it mattered little to him how Florence became a stable power if she only achieved the end, and so Machiavelli wrote his *Prince* – a work destined to become one of the few treatises which have crystallized a political theory into permanent form, a work that fits any age and will continue to fit any so long as human nature remains what it is.

The Business of a Prince Is to Make His State Great

And what was this theory that Signor Machiavelli worked out so well? So direct, so lucid, so comprehensive, and so frank is the *Prince* that a very brief analysis makes it clear. It opens with a definition of "the business of a Prince," which, says Machiavelli, "is to make his state great and to extend its borders." In Machiavelli's day the Prince so generally came into power by force or by adventurous brigandage that it was this class of rulers alone which he seriously considered in his Treatise. Obviously the first requirement of a Prince who has secured power is an army, his chief art is the art of war. Even the prophets themselves stood or fell by their power to back up their teachings by force, Machiavelli claimed. Thus Moses succeeded because he had an army to back up his laws. Savonarola failed because "when the multitude ceased to have faith in him he was destitute of the means either to compel faith or to inspire confidence." It was a Medieval application of the more modern saying, "Trust in God and keep your powder dry."

The Prince Should Use Secret Intrigue and Treachery

But while Machiavelli places full stress on the necessity of making war in the most scientific and approved manner, he by no means limits his Prince's duties to raising and disciplining troops and to conducting aggressive campaigns. In his judgment there is another and no less important field of action for every Prince, It is that of secret intrigue and treachery, the place in which states are most surely undermined and destroyed. The chief weapons in this field are lying, treachery, cruelty; and Machiavelli calmly advises the use of each, always supporting his contention with ample historical illustrations.

Lying and Craftiness Is a Necessity for a Prince

Lying, in his opinion, is a sacred necessity. "A prudent prince cannot and ought not to keep his word," he says, "except when he can do it without injury to himself, or when the circumstances under which he contracted his engagement still exist." Craftiness is to be cultivated sedulously. Indeed, Machiavelli impresses it upon his Prince that the fox is a worthy example to emulate. "As a Prince must learn how to act the part of a beast sometimes, he should make the fox and the lion his patterns, but the fox often wins when the lion would fail: I could give numerous proofs of this and those who have enacted the part of the fox have always succeeded best in their affairs.

A Prince Should Not Be Afraid of Cruelty

Nor should he be afraid of cruelty. Like lying and treachery it is often necessary. In an army it is useful in helping keep troops in order. In governing a city it prevents uprisings.

It is Better to Be Feared Than Loved

These are hard practices and evidently make a man feared and hated. Machiavelli calls attention to this fact and argues it out logically: "It has sometimes been asked," he says, "whether it is better to be loved than feared, to which I answer that one should wish to be both, but that is a hard matter to be accomplished and I think if it is necessary to make a selection it is safer to be *feared* than to be loved. Men are generally more inclined to submit to him who makes himself dreaded than to one who merely strives to be beloved; and the reason is obvious, for friendship of this kind being a mere moral tie, a species of duty resulting from a benefit, cannot endure against the calculations of interest; whereas fear carries with it the dread of punishment, which never loses its influence.

The Prince Must Renounce Good

As a general rule, Machiavelli lays it down that hatred is as easily incurred by good actions as by evil – and that when the strongest party is corrupt the Prince must comply with their disposition and content them. "He must renounce good or it will prove his ruin."

To Maintain Power a Prince Should Not Be Good

It is not a high notion of humanity that such doctrines as these presupposes. Machiavelli admits this frankly. Indeed, throughout his treatise he repeatedly claims that it is only possible to practice the methods he advises because men are generally so cowardly, so treacherous, and so selfish. For instance, in explaining the wisdom of not keeping promises he says, "I should be cautious in inculcating

such a precept if all men were good; but as the generality of mankind are wicked and ever ready to break their words, a prince should not pique himself in keeping his more scrupulously, especially as it is always easy to justify a breach of faith on his part." And again in cautioning His Prince against having any pride in being considered just and good he says, "The manner in which men live is so different from that in which they ought to live, that he who deviates from the common course of practice and endeavors to act as duty dictates necessarily insures his own destruction. A Prince who wishes to maintain his power ought therefore to learn that he should not be always good.

The Use of Force and Treachery

It is thus by force, craft, and treachery and by a wholesale application of the principle that every man has his price that the great Italian taught that power is to be secured. But this means enemies, for, whereas, a man beaten in an open contest waged according to the rules of war, may become a friend, he who has been stripped of his possessions by craft and treachery combined with force rarely, if ever, can be trusted.

The Prince Should Take Men into Partnership or Crush Them

How shall he deal with them? It is simple in Machiavelli's judgment. "Either make a man your friend or put it out of his power to be your enemy," he says. That is, take him into partnership or crush him. "He may revenge a slight injury, but a great one deprives him of his power to avenge. Hence the injury should be of such magnitude that the Prince shall have nothing to dread from his vengeance." That is, the only safe way to deal with a conquered enemy is to destroy him, and particularly is this true if that enemy has ever known freedom.

The Prince Should Not Help a Rival Power

Not only must you destroy all those you conquer, but under no circumstances should you help a rival power in any of its enterprises, even if those enterprises be quite foreign to those in which you are interested – nothing in which as far as you can foresee you ever will be interested, for the prince who contributes to the advancement of another power runs the risk of ruining his own. The rival may, through the help given him, so advance in power that it may one day ruin the Prince himself – that is, never help in any way anybody outside of your domain.

The Rules for Securing and Increasing Worldly Power

But while Machiavelli lays down forcibly and clearly the above rules as essential to securing and increasing worldly power, he repeatedly advises against the unguarded use of them. For instance, cruelty must always be "well applied" – that is, only exercised when it is absolutely necessary. Again, although a Prince must do evil when required to preserve and strengthen his domain, he must, above

all, preserve an appearance of always doing good. "A prince should earnestly endeavor to gain the reputation of kindness, clemency, piety, justice, and fidelity to his engagements. He ought to possess all these good qualities, *but still retain such power over himself as to display their opposites whenever it may be expedient.*

The Prince Should Maintain an Outward Appearance of Kindness and Piety

"I maintain that a Prince, and especially a new Prince, cannot with impunity exercise all the virtues, because his own self-preservation will often compel him to violate the laws of charity, religion, and humanity. He should habituate himself to bend easily to the various circumstances which may, from time to time, surround him. In a word, it will be as useful to him to persevere in the path of rectitude, while he feels no inconvenience in doing so, as to know how to deviate from it when circumstances dictate such a course. He should make it a rule, above all things, never to utter anything which does not breathe of kindness, justice, good faith, and piety; this last quality is most important for him to appear to possess, as men in general judge more from appearances than from reality. All men have eyes, but few have the gift of penetration. Every one sees your exterior, but few can discern what you have in your heart."

The Doctrine of the End Justifies the Means

These, briefly, are the famous principles of Machiavelli. In a word, it is the doctrine that the end justifies the means, that whatever is necessary in order to secure the glory of your country is right. Men should love their country more than their souls.

Machiavelli Sought to Teach a Tyrant How to Become Impregnable

Machiavelli gave the *Prince* to the Florentine Despot, but he did not get his reward. Whether the treatise was too strong for the stomach of Lorenzo or not, we do not know. It was only after Machiavelli's death that the work was published, and no sooner was it out than a storm of indignation broke over it. Impious, infernal – no adjective was too strong to describe the popular judgment. The Republicans called him traitor because he sought to teach a tyrant how to become impregnable. The Despots hated him because he showed their hand. The church, outraged by his frank accounts of the discrepancies between her practices and principles, put the Prince under its ban and burnt Machiavelli in effigy. And yet Machiavelli had not invented Machiavellianism. He simply described as clearly and succinctly as he could the methods which his observation and study had taught him to be the most successful in ruling Italian cities. He had considered not at all the morality of methods – no despot who won glory did that. He had considered not at all that a man might lose his soul, might drive other men to destroy their souls, by these practices.

Machiavelli Revealed the Formula for Worldly Success

The glory of the state – that in Machiavelli's mind was the end of all political action. If it cost men their souls why still the glory of the state justified the price. Italy had taught him this, yet Italy, when she saw her own theory stated in black and white, turned on the man who had analyzed her so plainly, and called him traitor. The world took up the cry and from that day to this has characterized the theory that the end justifies the means with the opprobrious title of Machiavellian. It has made an adjective of reproach of the great Florentine's name, as if he had let loose the evils inherent in the theory which bears his name. As a matter of fact, all that Machiavelli did was to work out the formula for worldly success followed by the ablest rulers of his own time. His crime in the eyes of Florence was that he revealed the formula.

The Principles of the Prince Are in Active Operation Throughout the World

But though the world repudiated the Machiavellian theory as soon as it saw the light, it by no means abandoned it. Again and again since the *Prince* first was written, four hundred years ago, its principles have been in as active operation as in the age of despots. Again and again those who hated and feared the theory have risen to overthrow it. What was the Reformation in essence but a revolt against Machiavellianism in the church. What was the French Revolution? Every age, indeed, has seen this theory intrude itself in Church or State, and has seen an attack upon it. Every country has had repeated struggles with it, so has every institution; indeed, so does every individual who aspires.

Machiavellianism Arises in America in the 1880s

There has always been a trace of Machiavellianism in American life, but never in the history of our country has the formula been applied and openly defended, until the last two decades.

A Modern Treatise in the Art of Acquiring and Extending Power

Today, however, one could easily reconstruct out of the mouths of our captains of industry a modern edition of the *Prince* which would serve quite as well as a textbook for the aspirant to financial power as the Prince of Machiavelli would have served Lorenzo Medici if he had the brains, the daring, and the dexterity to apply it. The object of this modern treatise, like that of the Medieval one, would be to instruct in the art of acquiring and extending power; but while four hundred years ago it was acquiring power in order to make a state rich and glorious, today it is acquiring power in order to make oneself rich and glorious. Four hundred years ago it was a state which the Prince aspired to control, today it is a great business – a natural product like iron or coal or oil, a great food product like beef, a great interstate transportation line like the railroad, a great deposit for the savings of the poor like a life insurance company. These are the Kingdoms for which the modern

man sighs. They do not come to him as an inheritance any more than in the fifteenth and sixteenth centuries Italian cities came to Despots by inheritance. They come by force, and today, as in Machiavelli's time, the chief art of the would-be captain of industry is war, the end of which is to acquire that which other men now control.

Business Is War

It matters not at all that the man who owns the enterprise desired to extend the captain's power may have been a pioneer in the industry, may have been one of the first in the country to make sugar, or produce oil, raise cattle, or ice cars; it matters very little that he has developed his own markets, invented his own processes and machines; his property is wanted and he cannot be allowed to live free any more than in Machiavelli's judgment Cesare Borgia should have allowed the Italian princes whose domain skirted his and who were weaker than he to live free. Business is war, then, not a peaceful pursuit.

The Art of Developing Monopolies

And this commercial warfare has been developed by our modern captains to a science as perfect as the militarism of the nations. Its tactics are as admirable, its plans of campaign as clear and able. – You want to control beef, for instance – an excellent kingdom to master, so steady and sure are its resources in a prosperous land. But how can you do it? It is an industry as old as the nation. It has been built up and is owned and managed by ten thousand cattlemen on a thousand hills and plains, by hundreds upon hundreds of dealers in the numberless cities and villages and country-sides of the land, by scores upon scores of railroads and steamship lines which compete to carry its products. Where is the central position which, controlled, will bring them all, cattle-raiser, transporter, marketman, under your direction or, if you prefer, drive them from the industry? Any modern captain will tell you it is in transportation. If you can, by any means, so control the railroads and steamships which ship the cattle first and the dressed meat later as to obtain better rates than anybody else, you can control ranchmen and dealers. For if you can ship what you buy cheaper than your competitors, you can afford to sell cheaper. The world buys where it can buy cheapest. In time the world's market is yours and when it is yours you can pay the ranchman your own price for cattle. There is nobody to offer him another. You can make your own rate for the transportation; you are the only shipper. You can demand of the consumer the highest price. There is nobody to offer him one lower.

The Development of Financial Monopolies

Secure the special favor of the railroad then and the rest will be easy, as it is in all great military campaigns where the key to the position has been found and where all resources have been concentrated on its capture. And this favor secured, go after the dealer. If you are a courageous and plausible person, tell him frankly

that his business belongs to you, and he had better sell at once. But he does not wish to sell. He has queer ideas about the business being his. He stands on what he calls his rights and a fight is as inevitable as it was in Machiavelli's time when some little Italian town accustomed to governing itself refused to turn over its keys to a big neighbor. And it is beautifully clear from the revelations of our captains of industry during the last thirty years of investigation on what plans the fight will be fought. Cut off his supply of meat. If he has none he sells none. But cattlemen cannot be prevented from selling. No, but if it costs the obstinate dealer more to get that meat to his market than it does you to get it to yours, he cannot sell at the price at which you sell. And here enters the railroad rebate – the modern battering-ram for crushing those who fight to save their own. Crushing them by preventing them getting the supply on which they feed at livable rates of transportation. We all understand it. For nearly forty years we have had it illustrated constantly before our eyes. Recently we have had it *ad nauseam*. Small dealers in oil and coal and lumber and salt, and a hundred other things forced into combination, into bankruptcy, or into new lines of business – because they could not get a rate which enabled them to ship; the big shipper forcing the discrimination until his rival succumbed like a wall weakened by incessant battering.

The Attacks on Recalcitrant Businesses

But the besieging captain of today has other weapons than his formidable special rate. Have you ever watched, month after month, an attack on a recalcitrant business by some great leader? It is quite as interesting in its way as the study of the siege of Toulon, of Vicksburg, or of Port Arthur. Mines are run under the man's credit and exploded at the moment when they will cause the most confusion, abatis are constructed around his markets until whenever he would enter them he falls into entanglements which mean retreat or death, a system of incessant, deft sharpshooting is kept up, picking off a bit of raw product here, delaying a car-load there; securing the countermand of an order at this point, bullying or wheedling into underselling at that, trumping up lawsuits, securing vexatious laws. For fertility of invention in harassing maneuvers I recommend the campaign of a modern captain of industry as far superior to the annoyances of the famous guerrilla warfare of the Spaniards.

The Modern Captains of Industry Use Machiavellian Tactics to Destroy Free Enterprise

Now we will all admit that under the competitive system, in a sense, business is war; that is, men are each rightfully seeking to make his own venture as big and as powerful as his ability and energy permit, but in all war, even that of four hundred years ago, there are rules. Compare the use of the ancient battering-ram with the use of the modern one – the rebate. The former was recognized as a legitimate instrument, and the latter has always been declared illegitimate. That is, when an Italian Despot sallied forth to knock down the walls of a city he wanted to add to

his domain he used an instrument which the laws allowed – but our modern captain uses as his principal weapon of conquest an instrument forbidden by all the laws of the game. As far as weapons of war are concerned, he really goes the Italian Despot one better. Not only that; he equals him easily in those practices which have always been supposed to be an Italian specialty, and which, as has already been pointed out, form the backbone of Machiavellianism as it is developed in the *Prince*. Consider the parallel. Our modern captain, like our medieval tyrant, must be prepared for cruelty. If he cannot win over a man and make him a convert to his scheme, or if he does not want him in his aggregation – he must put it out of his power to be his enemy – that is, he must crush him. Machiavelli suavely advises to do him an injury of such magnitude that the Prince shall have nothing to dread from his rival's vengeance. This will make you feared, of course, but the consoling observation Machiavelli offers to those who may gulp a bit at wholesale slaughter is that it is safer to be feared than loved.

People Fear the Captains of Industry on Wall Street

What is today half the power of a half-dozen of our leading captains of industry? It is that they are *feared* by thousands of men. What is it that drives many a railroad president to grant rebates – a crime in the eyes of the law for which he knows that if the government does its duty he will be fined and imprisoned? Fear of a warfare on his freight, his bonds, his stocks. Why do so many men with righteous causes of complaint throw up their hands at the approach of the captain of their particular industry? Because they know that resistance almost inevitably has ended in failure. Every one who knows Wall Street – the railroad business, the copper-steel, oil, beef business – knows that half the popular stock in trade of the leaders is that they have intelligently and persistently cultivated Machiavelli's counsel that it is safer to be feared than loved.

Wall Street Business Leaders Lie to the American People

It is not only cruelty which is necessary in modern businesses. It is lying. Follow the testimony in the great insurance investigations of the past fall and compare it with the investigations of other years, and perjury sticks out at every corner, perjury so obvious in many cases that it is laughable. Follow the testimony of the leader of the great oil trust – that of many railroad men. When it is necessary they lie. – No Borgia or Medici ever followed more wisely and carefully than our captains Machiavelli's great rule – "A prudent prince cannot and ought not to keep his word except when he can do it without injury to himself."

Lying for the Sake of Business

But while the Machiavellian rule that a Prince should do evil or good according as the one or other serves his interests can be shown by a multitude of documents to be followed faithfully and intelligently by the modern captain of industry, he is no less scrupulous in obeying Machiavelli's injunction not to do evil unnecessarily,

that is to do it only when it is necessary to attain the end. Our modern captains of industry rarely lie or break the laws, bribe or practice cruelty, save for the sake of the end that is they do not do these things for the sake of doing them as a Caligula or a Nero would have done. They do them for the good of the business. Listen to one of our railroad officials who, recently on the stand, testified to granting a rebate. "We knew it was illegal but it was the only way we could get our share of the business;" that is, the law is less important than the share of business.

In the Minds of Commercial Leaders the End Justifies the Means

In one great concern where for nearly forty years there is an unbroken record of lawbreaking and of spying and of hard dealings, the repeated explanation has been that it was for the good of the business. Not long ago a Western Senator of the United States was found guilty of stealing public lands. A former colleague openly justified him on the ground that by this robbery the land had been opened up more quickly than it otherwise would have been. Wherever a case comes to the surface it is promptly justified as necessary to keep up the dividends, expand race, meet competition, get your share of the business, stimulate commerce. That is, in the minds of our commercial leaders the end justifies the means as much as it ever did in the mind of Cesare Borgia, the monks of the Spanish Inquisition, of Napoleon Bonaparte, or of Count Metternich.

Modern Captains of Industry Use Charitable Giving to Deceive People

Probably at no period of the world's history where the Machiavellian formula has been the chief working one of a great social institution has its crowning principle – to give the whole fabric the color of charity – been so universally practiced as it is today by our captains of industry. Cesare Borgia, Machiavelli's great model and that incredible villain, his father, Pope Alexander VI, troubled themselves precious little about screening their deeds with clemency and charity – their failure to do so was a chief cause of their final failure. Machiavelli realized this and it was his reason for repeatedly putting emphasis on the necessity of posing as a saint, however great a devil we may be. Today there is hardly to be found in American industry a leader, however Machiavellian in practice, who does not seek to justify himself in the eyes of the public by some form of benefit to society. He may cultivate the arts, he may establish lectureships, he may endow colleges, he may build hospitals, but whoever he is – however truly a commercial brigand he is, he follows Machiavelli in appearing a social benefactor. It is instinct with him primarily – not calculation. There are few men, whatever their practices, who do not instinctively desire to be called honorable and generous, and to be considered gentlemen.

When the People Become Alarmed Create a Distraction

The world has so advanced since Machiavelli's days, too, that few men are so unconscious of the social obligations that they do not try to square themselves with

God and man for what they take contrary to the legal or the moral code. But what may be instinct at first inevitably becomes a calculation as they grow in brigandage. They see it pays to be known as public benefactors. That such a reputation will keep the public silent longer than any other. That a great gift may often head off a legislative investigation. It is an application of Napoleon's wisdom: When the people are restive, "gild a dome," that is, give them something new to see and talk about, distract their attention; that done, their sense of injustice is soon asleep.

Commercial Machiavellianism Is the Accepted Business Code of Today

Now this parallel between our modern industrial code and that of the *Prince* is not a mere fanciful one. It is a legitimate historical parallel easily reinforced by a multitude of documents as every one must admit who knows the industrial records of the United States for the last forty years. Commercial Machiavellianism is the accepted industrial formula. It is not only accepted and defended as necessary to our national prosperity and our happiness by those who practice it and profit by it, but the Nation, as a whole, winks at it. How often do we hear from the lips of eminently respectable citizens the words: "Business is business"? How often in justification of lying, "Everybody lies"? How often in defense of bribery the words of the Missouri judge, "Bribery at worst is merely a conventional crime"? How often the words of Tim Campbell of New York "What's the Constitution between friends"? That is, the public as a whole is coming to admit Machiavellianism as a business necessity and to justify it by the end.

The Accumulation of Private Wealth and Power

Now looked at a little more closely what is the business end our captains of industry seek? It certainly is not – never has been – except in rare cases, the mere accumulation of private wealth, the mere winning of personal power. These men who control the industrial world today are, as a rule, men of "great imagination – men who have looked over a vast field of scattered forces and seen how they might bring them into harmony and direct them to definite ends, how in thus combining and organizing they might not only build in their own land one great and splendid industry in the place of the thousands of little ones now doing the work, but they might extend this great creation into foreign lands, thus enlarging American empire, piling up American power, enriching the American people.

The Dream of Universal Empire

Our captains of industry are poets in their ways – poets who rhyme in steel and iron and coal, whose verses are great ships and railways and factories and shops. They create that the world may have more food and light and shelter and joy. – They create for the joy of it – for the sake of feeling themselves grow, for the sake of doing for those they love. This, to a degree, is the vision of them all. These are noble ends, but they can only be kept so by noble means. Yet, almost immediately

comes the realization that this dream of universal empire cannot be reached by the means which human law and justice prescribe. What of it? The man, hot with his vision, sees his end as greater than truth, than righteousness, than justice. He gradually, and perhaps unconsciously at first, works out a modern version of the half-pagan formula of Machiavelli to apply to a modern and Christian situation, and the world, dazzled by the magnificence of his achievement, justifies him as he does himself.

Great Monopolies and Trusts in Existence

Now, is he right? Are we right? Is the Machiavellian system today so firmly implanted justified by its results as we see them today? What are the results? Take the material ones. Is there a great monopolistic trust in existence today which has carried out its avowed purpose of better and cheaper products, because of combination? In my judgment not one. The whole history of the trust aiming at monopoly has been that it never gave a pound of beef or a gallon of oil of any better quality or cheaper price than it is forced to do by competition. And why should we expect it to? Suppose that a trust builder started out honestly, fired by the vision of a world-wide machine – a benefit to man and a glory to his nation – and to accomplish this end he breaks laws, crushes rivals, lies, is cruel, treacherous, unscrupulous. How long will his vision resist his evil doing? Let us who have seen our visions fade by the hardening of our hearts which let us grant that the man may have had at the start, is killed by the wrong doing necessary to secure his end. A selfish greed of power and gold replaces it. It cannot be otherwise. The ideal must deteriorate if the means used to realize it are vicious.

Unbridled Greed Leads to Downfall of Powerful Business Leaders

Look at the history of the Life Insurance Companies as revealed recently. The men at their heads have wrought their own ruin by deliberately doing evil – doing evil because of their unbridled, increasing greed. Yet, no doubt, the day was when many of the men foremost in these scandals were fired by the nobility and the sacredness of their business, and looked with pride and exultation on the amount of the return they could by careful and devoted management, make to the thousands upon thousands of the poor who saved and denied themselves and struggled to provide for dependent wife or child. And yet these men came to struggle to secure for themselves and their families and friends the bulk of all the earnings coming from the money of those who had trusted them. Never, indeed, have we had a more perfect example of the ultimate result of the Machiavellian formula – and that is the moral downfall of the man who practices it.

Machiavellian Practices Corrupt Employees and the Youth

But the formula not only ruins the men who practice it – what does it do for the great body of young men who, as employees of a great corporation, must, of necessity, know the meaning of the practices? Take the matter of bribing clerks in

railroad freight offices to turn over information concerning the shipments of rival concerns. In at least one great trust this practice is so extensive as to have become a matter of elaborate bookkeeping. No clerk can be so stupid as not to know he is doing a wrong and harmful act when he betrays private information. He knows the money paid him for the information is a bribe. Yet the money comes from a great and powerful corporation. Even if he wants to refuse it he dares not lest he lose his position. His honor is sullied – his manhood shaken – his soul corrupted. There can be no estimation of the corruption of manliness which this practice alone has caused. There can be no condemnation too bitter of the men who have devised the system. They are corrupters of youth.

Machiavellian Practices Teach That Lying Is Part of Business Strategy

Think again of what must be the effect on a great body of young men employed by a trust, when they know their president has lied deliberately on the witness stand, has lied for the good of the business. There are plenty of such cases revealed in our commercial investigations. The young man loyal to his employer and yet trained to honor the truth must almost inevitably come to the conclusion that lying is one of the necessary implements in successful business – and as time goes on he probably will conclude that it is all right if it will aid in getting you anything you want. If the good of the business justifies lying, it justifies all other things – law-breaking, cruelty, treachery; unconsciously the young man becomes a Machiavellian in his theory of the relation of honor to business.

The Young Men in America are Learning the Art of Commercial Machiavellianism

Not only does he come to defend these practices to himself; he soon will be adept in defending them to others. Let us suppose that the private secretary of some great captain of industry of today – a man who, for the good of the business, has found it necessary to put into practice the methods we have been considering – suppose this man's confidential secretary to be a man of keen and analytical mind, of clear power of expression, of an ardent enthusiasm for business, loving the particular industry whose captain he serves as Machiavelli loved Florence; ambitious to see it all-powerful as Machiavelli was ambitious to see his beautiful Florence powerful; and let it come to a point in his career, as it came in Machiavelli's when he was about forty-five years old, that his industry, after the loss of its first powerful head, retrogrades from a first to a second or a third place in the order of business industries – that it is in danger of falling still lower. The secretary sees the reason – the new management has loosened its grip. It no longer fights for the privileges the law forbids – no longer tracks its competitors in secret and in secret undermines them, no longer bribes or lies. Can you not imagine this secretary reared to believe that these things are essential in business and that business success is a paramount duty; can you not imagine him sitting down to frame for the guidance of those who, in his judgment, are ruining the business – the

code which alone in his experience and judgment can make a business great? That is, our young men the country over are not only learning the essentials of commercial Machiavellianism and accepting them, but they are becoming their defenders. And when they reach this point clear thinking and unselfish actions will be as impossible to them as recent revelations show that they have become to an appalling number of our financial leaders. They are men lost to society – men lost to the state. There is but one name for this and that is treason. Indeed, I doubt if this trust question has a more serious phase than this corrupting of the minds and the hearts of youths.

Machiavellianism Is the Working Formula of the Major Political Parties in America

But this Machiavellian formula affects more than our industrial life today. It is, to an alarming degree, the working formula of our political parties. It has reduced at least one great sport to a degradation which is a national scandal. It crops out in every art and profession. It has invaded even the field whose teachings are most fundamentally antagonistic to it – the field of the Christian religion. What are the scandals of our political life but the gross application of the great Italian's principles. We buy votes that our party may succeed. It is illegal, it is corrupt; but the success of the party is higher law, to which we must sacrifice our common creed of morals. We stuff ballot boxes, run in repeaters, vote in blocks of five, juggle the returns all for the glory of the party. We take the funds of corporations whose only object we know to be to provide a future protection and favor for themselves, we do it though it is in many places contrary to law, and everywhere contrary to sound morals. We tolerate, even support, in their aspirations unspeakable politicians like Addicks of Delaware, Depew of New York, Quay of Pennsylvania. The good of the party requires it. If by any chance scandals occur, bribery is too flagrant, the alliance between the Campaign Committee and the Corporations too obvious, the activities of the politicians too pernicious, we do our best not to force out the truth that we may correct the wrongs; we cover them with plausible explanations, condone them with scriptural quotations on the sin of judging our fellow man – as if the whole basis of government by the people was not judging him – protect them with the pious challenge "let him who is without sin cast the first stone," silence all critics by a bluster of righteous indignation as to the impossibility of people whose aims and words are so noble doing these vile things. It is the Machiavellian game of affirming you are virtuous whatever your practices. It is a great game, and, well played, it works a long time.

The Machiavellian Creed Influences All Aspects of Life Including Literature

But it is impossible in a nation where business and politics are the two absorbing interests that the dominating creed of those interests should not influence all departments of life. It is inevitable that our art and our literature should not escape the Machiavellian hand which rules us. We see it in the overweening

respect that we have for the "best-sellers" among books, the big prices of the artists. Quantity and price, not the integrity, sincerity, and freshness of the product, are unquestionable, powerful motives in artistic life today.

The Influence of Machiavellian Doctrines on Christianity

Most deplorable of all is the influence these doctrines have on the Church. In a poem published not long ago in a leading religious journal this line is found, "The Union right or wrong, still this will be my song." It is nothing but a new version of the Middle Age theory that for the glory of a country a man should be willing to sell his soul. And could anything be more brutally Machiavellian than the arguments recently brought to bear upon one great captain of industry by certain of those who were trying to induce him to contribute to foreign missions, that quite apart from the persons converted the mere commercial result of missionary effort to our land is worth a thousandfold every year of what is spent on missions!

Commercial Machiavellianism Is the Most Alarming Phase of American Life Today

It is this threatening saturation of all our active ties with commercial Machiavellianism which is the most alarming phase of American life today. Unless it is checked it means a general demoralization of the sense of fair play, a general lowering of our intellectual honesty. Our indifference to it up to this point has, perhaps, been natural enough. The nation, as a whole, has been dazzled by its material success. There is no one of us with blood in his veins, with the love of great games and great fights in his heart, that is not stirred by the sight of growth, of expansion, of the piling up of wealth and power. These mammoth enterprises of ours, extending around the earth, fill us with exultant pride. We are an achieving people, we say. We recall, too, that these great material successes mean other things. They mean endowments for our colleges, buildings and equipment for our hospitals, fresh funds for our missions, parks in our cities, pictures in our museum. It is, perhaps, natural that in our pride at the magnificence of our results we should overlook the integrity of the means by which they are achieved, should fail to ask ourselves whether clear thinking, honest living, aspiring ideals, unselfish devotion to unselfish ends were growing as fast as endowments and buildings. It is certainly easy enough for any one to persuade himself for a time at least that material growth is its own justification, particularly when that success contributes to one's pet enterprises.

Growing Public Indifference at How Men Make Money

At all events for many years warnings against the corruption inherent in our illegal and immoral business practices have been received by the majority of those to whom our public morals are entrusted with silence or apology. "Judge not lest ye be judged," "Let him who is without sin cast the first stone," they tell us. Can there be greater blasphemy than to apply these noble Christian counsels to men

convicted repeatedly of betraying their trusts, of perjuring themselves for business sake, of breaking and evading laws for greed. Even the continued revelations of these practices and the awful results in destroying character which are and have been coming to us daily this fall have not been sufficient to disturb the complacency of many a smooth-tongued teacher. We still hear "wait – judge not lest ye be judged " uttered by eminent mouths as proof after proof is laid before us of the ruin of character which has been wrought by our long indifference to how a man made his money if he only made it and gave it to the church or college or city. This is no advocacy of hasty condemnation. To accuse without proof is a crime, but to excuse when you have proof is likewise a crime.

The People Must Declare For or Against the Machiavellian Doctrines

The issue is coming to be too distinct to evade. We must either declare for or against the Machiavellian theory. I am told that it is useless to trouble ourselves, that it will right itself. And that is true. It will right itself in the long run. We all of us may accept, root and branch, the Machiavellian theory, accept it, practice it in our business, in our homes, in society. We may make this country as truly Machiavellian as was the Age of Despots, but that will not defeat the ultimate triumph of eternal justice. The Good is the stronger principle. It finally prevails. All that we can do is temporarily to accelerate or to delay the stream of righteousness. We can help make our age Machiavellian, but all of the men of the earth combined cannot entrench that theory so firmly that a future age will not destroy our work. We cannot build so gloriously with it that a future age will not condemn us as we do the Despots of Italy. The question is whether we are going to throw our weight for or against the present system – whether we are going as a nation to tolerate it and let the future overthrow it or whether we are going to try to take care of it ourselves.

Commercial Machiavellianism Is Our Great Problem Today

There are many signs that we are choosing to do our own housecleaning, that we have intention of going down to history along with Cesare Borgia and Alexander VI, the Monks of the Inquisition and Count-Metternich; that we are recognizing frankly that commercial Machiavellianism is our great present-day problem.

The Most Effective Strategy Is to Expose the Machiavellian Principles Practiced by Businessmen Today

And if so, what is there to do about it ? The first and most effective work is to air the formula, drag it out into the light, put it down in black and white, state it exactly as it is and as our captains practice it. How many of the very men who practice the Machiavellian formula would be willing to stand by it in the open if it were put to them in its bald truth ? How many of them would openly put their names to the following creed ?

The Modern Machiavellian Creed

"Success is the paramount duty. It can be attained in the highest degree only by force. At times it requires violence, cruelty, falsehood, perjury, treachery. Do not hesitate at these practices, only be sure they are necessary for the good of the business and be very careful to insist upon them always as wise and kind and that they work together for the greatest good of the greatest number." We all know that there is scarcely one of them so hardened that he would not pale at the thought of signing that creed and yet it is constructed substantially out of their own words as spoken at one time or another on the witness-stand.

A System Which Requires That Men Sell Their Souls for Worldly Glory

The truth is the Machiavellian formula carries its own death potion with in. It cannot stand the light. It is only strong when is out of sight – when it is unuttered. Today, as four hundred years ago, state it bluntly and men disown it. Why was Machiavelli repudiated by Italy as soon as the *Prince* was published? Why has his name remained to this day in all nations an adjective of reproach? Because he set forth uncondemned a system which demands that men sell their souls for worldly glory. And never in any age, blind and hard and temporizing as men may have been, have they been fling to admit aloud that it pays to buy wealth or power or glory at the cost of the soul. They are willing to practice the formula so long as they can avoid hearing it; those who profited by their success have been willing to support them so long as they could deaden their intellects by repeating "judge not lest ye be judged," but when it came to defending the Machiavellian creed aloud, they dared not do it.

Truth Is the Cure for Commercial Machiavellianism

And herein lies our safety. The truth, nothing but the truth, ugly and cruel and relentless as it may be, is the cure for commercial Machiavellianism. ("Commercial Machiavellianism," McClure's Magazine, Vol. XXVI, March, 1906, No. 5, pp. 453-463.)

ii. The Development of the European Banking System Throughout the World

A World System of Financial Control in Private Hands Able to Dominate the Political System of Each Country and the Economy of the World As A Whole

"... [T]he powers of financial capitalism had another far-reaching aim, nothing less than to create a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole. This system was to be controlled in a feudalist fashion by the central banks

of the world acting in concert, by secret agreements arrived at in frequent private meetings and conferences. The apex of the system was to be the Bank for International Settlements in Basle, Switzerland, a private bank owned and controlled by the world's central banks which were themselves private corporations. Each central bank, in the hands of men like Montagu Norman of the Bank of England, Benjamin Strong of the New York Federal Reserve Bank, Charles Rist of the Bank of France, and Hjalmar Schacht of the Reichsbank, sought to dominate its government by its ability to control Treasury loans, to manipulate foreign exchanges, to influence the level of economic activity in the country, and to influence cooperative politicians by subsequent economic rewards in the business world.

"In each country the power of the central bank rested largely on its control of credit and money supply. In the world as a whole the power of the central bankers rested very largely on their control of loans and of gold flows.... [T]hese central bankers were able to mobilize resources to assist each other through the B. I. S., where payments between central banks could be made by bookkeeping adjustments between the accounts which the central banks of the world would keep there. The B. I. S. as a private institution was owned by the seven chief central banks and was operated by the heads of these, who together formed its governing board. Each of these kept a substantial deposit at the B. I. S., and periodically settled payments among themselves (and thus between the major countries of the world) by bookkeeping in order to avoid shipments of gold. They made agreements on all the major financial problems of the world, as well as on many of the economic and political problems, especially in reference to loans, payments, and the economic future of the chief areas of the globe.

"The B. I. S. is generally regarded as the apex of the structure of financial capitalism whose remote origins go back to the creation of the Bank of England in 1694 and the Bank of France in 1803.

"... It must not be felt that these heads of the world's chief central banks were themselves substantive powers in world finance. They were not. Rather, they were the technicians and agents of the dominant investment bankers of their own countries, who had raised them up and were perfectly capable of throwing them down.

"The substantive financial powers of the world were in the hands of these investment bankers (also called 'international' or 'merchant' bankers) who remained largely behind the scenes in their own unincorporated private banks. These [bankers] formed a system of international cooperation and national dominance which was more private, more powerful, and more secret than that of their agents in the central banks. This dominance of investment bankers was based on their control over the flows of credit and investment funds in their own countries and throughout the world. They could dominate the financial and industrial systems of

their countries by their influence over the flow of current funds through bank loans, the discount rate, and the rediscounting of commercial debts; they could dominate governments by their control over current government loans and the play of the international exchanges.

"Almost all of this power was exercised by the personal influence and prestige of men who had demonstrated their ability in the past to bring off successful financial coupes, to keep their word, to remain cool in a crisis, and to share their winning opportunities with their associates. In this system the Rothschilds had been preeminent during much of the nineteenth century, but, at the end of that century, they were being replaced by J. P. Morgan whose central office in New York, although it was always operated as if it were in London (where it has, indeed, originated as George Peabody and Company in 1838). Old J. P. Morgan died in 1913, but was succeeded by his son of the same name (who had been trained in the London branch until 1901), while the chief decisions in the firm were increasingly made by Thomas W. Lamont after 1924. " (Carroll Quigley, *Tragedy and Hope: A History of the World in Our Time*, New York: The Macmillan Company, 1966, pp. 324, 326-327.)

Ignorance of the Nature of Coin, Credit and Circulation Lead to Perplexities in America

"All the perplexities, confusion, and distress in America arise, not from defects in the Constitution or confederation, not from the want of honor or virtue, so much as from downright ignorance of the nature of coin, credit and circulation." (John Adams, Letter to Thomas Jefferson, 1787. Quoted in Robert L. Owen, *National Economy and The Banking System of the United States*, Senate Document No. 23, 76th Congress, 1st Session, Washington, D. C.: Government Printing Office, 1939, p 99.)

Banking Institutions Are More Dangerous to the Liberties of People Than Standing Armies

"If the American people ever allow the banks to control the issuance of their currency, first by inflation and then by deflation, the banks and corporations that will grow up around them will deprive the people of all property until their children will wake up homeless on the continent their fathers occupied. The issuing power of money should be taken from the banks and restored to Congress and the people to whom it belongs. I sincerely believe the banking institutions are more dangerous to our liberties than standing armies. Already they have raised up a moneyed aristocracy that has set the Government at defiance." (Thomas Jefferson. Quoted in Olive Cushing Dwinell, *The Story of Our Money*, p. 84 and Robert L. Owen, *National Economy and the Banking System of the United States*, p. 99.)

The Importance of Controlling the Issuance of Money in a Nation-State

"Permit me to issue and control the money of a nation, and I care not who makes its laws." (Mayer Anselm Rothschild, 1790. Quoted in Robert L. Owen, *National Economy and the Banking System of the United States*, p. 99.)

The European Banking System is Based on Debt

"Let the American people go into their debt-funding schemes and banking systems, and from that hour their boasted independence will be a mere phantom." (William Pitt, Chancellor of the Exchequer, England, 1791. Quoted in T. Cushing Daniel, *Real Money Verses False Money – Bank Credits*, p. 32.)

The European Banking System Is Designed to Enslave Individuals, Communities and Nations

Of all aristocracies, none more completely enslave a people than that of money; and in the opinion of your committee, no system was ever better devised so perfectly to enslave a community as that of the present mode of conducting banking establishments. Like the siren of the fable, they entice to destroy. They hold the purse-strings of society, and by monopolizing the whole of the circulating medium of the country, they form a precarious standard by which the property in the country – homes, lands, debts and credits, personal and real estate of all description – are valued, this rendering the whole community dependent upon them; proscribing every man who dares to expose their unlawful practices." (Report of the Legislative Committee, State of New York, 1818. Quoted in T. Cushing Daniel, *Real Money Verses False Money – Bank Credits*, p. 33.)

The European Banking System Is Designed to Build Up a Money Aristocracy

"There never has been devised by any man a plan more specious by which labour could be robbed of the fruit of toil than the banking system. The people not only take bank paper as money, paying interest on it, but when banks suspend, the people lose the discount while the bankers gain it.

"The people wonder why financial panics occur so frequently. I can tell them why. It is to the interests of the bankers and brokers that they should occur. It is one of the specious methods by which these despotic and utterly useless knaves rob the producing, manufacturing and mercantile classes of their honest earnings. It is one of the chief plans by which this infamous ring is riveting the chains of slavery upon the limbs of labour. It is one of the chief means adopted to build up a money aristocracy that shall live in idle luxury and ape the pretentious airs of European nobility." (Daniel Webster. Quoted in Olive Cushing Dwinell, *The Story of Our Money*, pp. 139-140.)

The Elite Will Support the European Banking System Throughout the World

"The few [elite] who can understand the system (check money and credits) will either be so interested in its profits, or so dependent on its favors, that there will be no opposition from that class, while on the other hand, the great body of the people mentally incapable of comprehending the tremendous advantage that capital derives from the system, will bear its burdens without complaint, and perhaps without even suspecting that the system is inimical to their interests. (Letter written by the Rothschild Brothers of London, England to a New York firm of bankers, June 25, 1863. Quoted in Robert L. Owen, *National Economy and the Banking System of the United States*, pp. 99-100.)

Under the European Banking System Wealth is Aggregated In the Hands of the Elite

"Yes, we may congratulate ourselves that this cruel war is near the close, but I see in the future a crisis approaching that unnerves me and causes me to tremble for the safety of my country. As a result of the war corporations have been enthroned, and an era of corruption will follow and the money power of the country will endeavor to prolong its reign by working on the prejudices of the people until wealth is aggregated in a few hands and the Republic is destroyed. I feel at this moment more anxiety for the safety of my country than ever before, even in the midst of war." (Abraham Lincoln. Quoted in Olive Cushing Dwinell, *The Story of Our Money*, p. 202.)

National Debts Are a Form of Taxation

"National debts paying interest are simply the purchase by the rich of the power to tax the poor." (John Ruskin. Quoted in T. Cushing Daniel, *Real Money Verses False Money – Bank Credits*, p. 41.)

Wall Street Investment Banker Predicts Panic in America

"Unless we have a central bank with adequate control of credit resources, this country is going to undergo the most severe and far-reaching money panic in its history." (Jacob Schiff, Senior Partner, Kuhn, Loeb Co. Speech, Chamber of Commerce, New York, 1907.)

The U. S. Government is a Foster Child of Special Interests

"Suppose you go to Washington and try to get at your government. You will always find that while you are politely listened to, the men really consulted are the big men who have the biggest stakes – the big bankers, the big manufacturers, the big masters of commerce.... Every time it has come to a critical question, these gentlemen" have been yielded to, and their demands treated as the demands that should be followed as a matter of course. The government of the United States is a

foster child of special interests." (Woodrow Wilson, 1912, Quoted in *The Nation*, November 19, 1990, p. 589.)

The Greatest Monopoly in America

"The greatest monopoly in this country is the money monopoly. So long as that exists, our old variety and freedom and individual energy of development are out of the question. A great industrial nation is controlled by its system of credit. Our system of credit is concentrated. The growth of the nation, therefore, and all our activities are in the hands of a few men.... This is the greatest question of all; and to this, statesmen must address themselves with an earnest determination to serve the long future and the true liberties of men. " (Woodrow Wilson, Quoted in Louis D. Brandeis, *Other People's Money and How Bankers Use It*. New York: Frederick A. Stokes. Co., 1932 edition, pp. 1-2.)

The Money Trust is Not a Myth

"The control of credit also became dangerously centralized.... The financial resources of the country are [controlled by] small groups of capitalists.... The great monopoly of this country is the monopoly of big credits.... A great industrial nation is controlled by its system of credit. Our System of credit is privately concentrated. The growth of our nation, therefore, and all our activities, are in the hands of a few men.... This Money Trust ... is not a myth.... " (Woodrow Wilson, Quoted in Carter Class, *Adventures in Constructive Finance*, pp. 77-79.)

The Power of International Bankers and Monopolists

"Don't deceive yourselves for a moment as to the power of the great interests which now dominate our development. They are so great that it is almost an open question whether the Government of the United States can dominate them or not.

"Monopoly means atrophy of industry. If monopoly persists, monopoly will always sit at the helm of government. I do not expect to see monopoly restrain itself. If there are men in this country big enough to own the government of the United States, they are going to own it; what we have to determine now is whether we are big enough, whether we are men enough, whether we are free enough, to take possession again of the Government which is our own. We haven't had free access to it; our minds have not touched it by way of guidance, in half a generation.... " (Woodrow Wilson, Quoted in Olive Cushing Dwinell, *The Story of Our Money*, no date. p. 190.)

Federal Reserve Act Established the Most Gigantic Trust on Earth

"This Act [Federal Reserve Act] establishes the most gigantic trust on earth. When the President [Woodrow Wilson] signs this bill, the invisible government by the monetary power will be legalized. The people may not know it immediately,

but the day of reckoning is only a few years removed. The trusts will soon realize that they have gone too far for their own good. The people must make a declaration of independence to relieve themselves from the monetary power. This they will be able to do by taking control of Congress. Wall Streeters could not cheat us if you Senators and Representatives did not make a humbug of Congress. The division of Congress into political parties is a crime. The main object of the bosses in both political parties is to get offices and grant special favors at the people's expense. This is inherently a national government, and that is why party government is unsuccessful in dealing with economic problems. If we have a people's Congress, there would be stability. The greatest crime of Congress is its currency system. The worst legislative crime of the ages is perpetrated by this banking and currency bill. The caucus and the party bosses have gain operated and prevented the people from getting the benefits of their own government." (Congressman Charles A. Lindbergh, *Congressional Record*, December 23, 1913.

The Elite Financial Oligarchy is Dominated by International Investment Bankers

"The dominant element in our financial oligarchy is the investment banker. Associated banks, trust companies and life insurance companies are his tools. Controlled railroads, public service and industrial corporations are his subjects. Though properly but middlemen, these bankers bestride as masters America's business world, so that practically no large enterprise can be undertaken successfully without their participation or approval. These bankers are, of course, able men possessed of large fortunes; but the most potent factor in their control of business is not the possession of extraordinary ability or huge wealth. The key to their power is Combination – concentration intensive and comprehensive – advancing on three distinct lines:

"*First:* There is the obvious consolidation of banks and trust companies; the less obvious affiliations – through stockholdings, voting trusts and interlocking directorates – of banking institutions which are not legally connected; and the joint transactions, gentlemen's agreements, and 'banking ethics' which eliminate competition among the investment bankers.

"*Second:* There is the consolidation of railroads into huge systems, the large combinations of public service corporations and the formation of industrial trusts, which, by making businesses so 'big' that local, independent banking concerns cannot alone supply the necessary funds, has created dependence upon the associated New York bankers.

"But combination, however intensive, along these lines only, could not have produced the Money Trust – another and more potent factor of combination was added.

Third: Investment bankers, like J. P. Morgan & Co., dealers in bonds, stocks and notes, encroached upon the functions of the three other classes of corporations with which their business brought them into contact. They became the directing power in railroads, public service and industrial companies through which our great business operations are conducted – the makers of bonds and stocks. They became the directing power in the life insurance companies, and other corporate reservoirs of the people's savings – the buyers of bonds and stocks. They became the directing power also in banks and trust companies – the depositaries of the quick capital of the country – the life blood of business, with which they and others carried on their operations. Thus four distinct functions, each essential to business, and each exercised, originally, by a distinct set of men, became united in the investment banker. It is to this union of business functions that the existence of the Money Trust is mainly due.

The development of our financial oligarchy followed, in this respect, lines with which the history of political despotism has familiarized us: – usurpation, proceeding by gradual encroachment rather than by violent acts; subtle and often long-concealed concentration of distinct functions, which are beneficent when separately administered, and dangerous only when combined in the same persons. It was by processes such as these that Caesar Augustus became master of Rome...." (Louis D. Brandeis, *Other People's Money And How Banker Use It*, New York: Frederick A. Stokes 1914, 1932 edition, pp. 4-6.)

International Investment Bankers Devise An Ingenious System to Use Other People's Capital to Enrich Themselves

"The goose that lays golden eggs has been considered a most valuable possession. But even more profitable is the privilege of taking the golden eggs laid by somebody else's goose. The investment bankers and their associates now enjoy that privilege. They control the people through the people's own money. If the bankers' power were commensurate only with their wealth, they would have relatively little influence on American business. Vast fortunes like those of the Astors are no doubt regrettable. They are inconsistent with democracy. They are unsocial. And they seem peculiarly unjust when they represent largely unearned increment. But the wealth of the Astors does not endanger political or industrial liberty. It is insignificant in amount as compared with the aggregate wealth of America, or even of New York City. It lacks significance largely because its owners have only the income from their own wealth. The Astor wealth is static. The wealth of the Morgan associates is dynamic. The power and the growth of power of our financial oligarchs comes from wielding the savings and quick capital of others. In two of the three great life insurance companies the influence of J. P. Morgan & Co. and their associates is exerted without any individual investment by them whatsoever. Even in the Equitable, where Mr. Morgan bought an actual majority of all the outstanding stock, his investment amounts to little more than

one-half of one percent of the assets of the company. The fetters which bind the people are forged from the people's own gold.

"But the reservoir of other people's money, from which the investment bankers now draw their greatest power, is not the life insurance companies, but the banks and the trust companies. Bank deposits represent the really quick capital of the nation. They are the life blood of businesses. Their effective force is much greater than that of an equal amount of wealth permanently invested. The 34 banks and trust companies, which the Pujo Committee declared to be directly controlled by the Morgan associates, held \$1,983,000,000 in deposits. Control of these institutions means the ability to lend a large part of these funds, directly and indirectly, to themselves; and what is often even more important, the power to prevent the funds being lent to any rival interests. These huge deposits can, in the discretion of those in control, be used to meet the temporary needs of their subject corporations. When bonds and stocks are issued to finance permanently these corporations, the bank deposits can, in large part, be loaned by the investment bankers in control to themselves and their associates; so that securities bought may be carried by them, until sold to investors. Or these bank deposits may be loaned to allied bankers, or jobbers in securities, or to speculators, to enable them to carry the bonds or stocks. Easy money tends to make securities rise in the market. Tight money nearly always make them fall. The control by the leading investment bankers over the banks and trust companies is so great, that they can often determine, for a time, the market for money by lending or refusing to lend on the Stock Exchange. In this way, among others, they have power to affect the general trend of prices in bonds and stocks. Their power over a particular security is even greater. Its sale on the market may depend upon whether the security is favored or discriminated against when offered to the banks and trust companies, as collateral for loans.

"Furthermore, it is the investment banker's access to other people's money in controlled banks and trust companies which alone enables any individual banking concern to take so large part of the annual output of bonds and stocks. The banker's own capital, however large, would soon be exhausted. And even the loanable funds of the banks would often be exhausted, but for the large deposits made in those banks by the life insurance, railroad, public service, and industrial corporations which the bankers also control..." (Louis D. Brandeis, *Other People's Money And How The Bankers Use It*, New York: Frederick A. Stokes, 1914, 1932 edition, pp. 16-21.)

Government by Oligarchy

"Now to bring about government by oligarchy masquerading as democracy, it is fundamentally essential that all authority and control be centralized in our National Government." (Franklin D. Roosevelt, *The Public Papers and addresses of Franklin D. Roosevelt*, Volume I, *The Genesis of the New Deal*, 1928-1932, Radio

Address on States Rights, March 2, 1030, New York: Random House, 1938, pp. 569-575.)

A Financial Element Controls the United States Government

"The real truth of the matter is, as you and I know, that a financial element in the larger centers has owned the Government ever since the days of Andrew Jackson – and I am not wholly excepting the Administration of W. W. [Woodrow Wilson] The country is going through a repetition of Jackson's fight with the Bank of the United States – only on a far bigger and broader basis." (Franklin D. Roosevelt, Letter to Col. Edward Mandell House, November 21, 1933, *F.D.R.: His Personal Letters*, New York: Duell, Sloan & Pearce, 1950, p.373.)

The Masters of Industry and Commerce

"Whoever controls the volume of money in any country is absolute master of all industry and commerce." (President James A. Garfield, Quoted in a speech by T. David Horton, 'Monetary Crisis: Its Threat to Liberty,' *Congressional Record*, May 11, 1972.)

Concentration of Political Power in the United States

"During these times of great concern about the nation's political institutions, the press and the populace-at-large have expressed growing discontent about the vague, informal concentrations of political power that so often appear to exercise a hold on the working of our democracy. Whatever the genesis of such concentrations, they seem to have a number of characteristics in common: They are in part invisible, they are self-perpetuating, and they deal in a kind of power that never was mentioned in the Constitution. Some of these entities are quite real... " (John Thackray, *Institutional Investor*, May 1974, p. 58.)

The United States is Dominated by a Hierarchy of Wealthy Families

"The United States is owned and dominated today by a hierarchy of its sixty richest families, buttressed by no more than ninety families of lesser wealth. Outside this plutocratic circle there are perhaps three hundred and fifty other families, less defined in development and in wealth, but accounting for most of the incomes of \$100,000 or more that do not accrue to members of the inner circle.

"These families are the living center of the modern industrial oligarchy which dominates the United States, functioning discreetly under a de jure democratic form of government behind which a de facto government, absolutist and plutocratic in its lineaments, has gradually taken form since the Civil War. This de facto government is actually the government of the United States – informal, invisible, shadowy. It is the government of money in a dollar democracy."

(Ferdinand Lundberg, *America's 60 Families*, New York: The Citadel Press, 1946, p. 3.)

Mere Executives for the Main Groups of Banking Capital

"It is a common popular error to suppose that men like Owen D. Young, of the General Electric Company; Walter S. Gifford, of the American Telephone and Telegraph Company; Thomas W. Lamont, of J. P. Morgan and Company; Albert H. Higgins, until recently head of the Chase National Bank; Alfred P. Sloan, Jr., of General Motors; and Walter C. Teagle, of the Standard Oil Company of New Jersey, are leaders in the entourage of great wealth. Such figures, carefully publicized, are merely executives for the main groups of banking capital that represent the golden dynasties. These men have no independent power; they do not speak for themselves any more than do actors on a stage." (Ferdinand Lundberg, *America's Sixty Families*, p. 32.)

Thomas Lamont – An Agent of the Invisible Directory of High Finance and Politics

"An extraordinarily complex and resourceful personality like Thomas W. Lamont, who has been the brains of the J. P. Morgan and Company throughout the postwar period and was a mentor of Woodrow Wilson ... as well as of President Herbert Hoover ... has exercised more power for twenty years in the Western Hemisphere, has put into effect more final decisions from which there has been no appeal, than any other person. Lamont, in short, has been the First Consul de facto in the invisible Directory of postwar high finance and politics, a man consulted by presidents, prime ministers, governors of central banks, the directing intelligence behind the Dawes and Young Plans." (Ferdinand Lundberg, *America's Sixty Families*, p. 32.)

Private Banking Partnerships

"The private banking partnerships and the informal alliance are the ramparts behind the dominant families. In order of importance these private banking partnerships are J. P. Morgan and Company; Kuhn, Loeb and Company; Brown Brothers Harriman and Company; Lehman Brothers; Dillon, Read and Company; Bonbright and Company (Morgan); Lazard Freres; J. and W. Seligman; Speyer and Company; Goldman Sachs and Company; Hallgarten and Company; and Ladenburg, Thalmann and Company." (Ferdinand Lundberg, *America's Sixty Families*, p. 34.)

Silent Economic Forces Control the Destiny of Man

"The destinies of man are being molded by silent economic forces, which it is folly to resist, and that it is only by acting with and not against them that he can hope to advance his fortunes.... It is unwise to neglect forces, the strength of which

you are unable to measure. The power of Central Banks in cooperation, on the scale contemplated in the formation of the Bank for International Settlements, has never yet been put to the test." (Sir Charles Addis, K.C.M.G., Director, Bank of England, *Journal of the Institute of Bankers*, Volume 3, 1930, pp. 247-254.)

The Powers Which Preside Over Nations

"It is strange that the powers which preside over the fate of nations should not have called into being such an institution [Royal Institute of International Affairs, London] as this long ago.... Not one of the great blessing for which we pray, the aspirations to which we give vent when we talk of the federation of the world and the parliament of man, not one of these things will come to us unsought." (J. R. Clynes, Member, British Parliament, The British Institute of International Affairs, July 1922, 32-33.)

Three Hundred Men Control the Destiny of Europe

"Three hundred men, all of whom know one another, direct the economic destiny of Europe and choose their successors from among themselves." (Walter Rathenau, Quoted in Quigley, *Tragedy and Hope*, p. 61.)

The Supreme Money Power

"The hinge of the whole situation was this: the government itself was not to be a substantive power in matters of Finance, but was to leave the Money Power supreme and unquestioned." (William Gladstone, 1852, Chancellor of the Exchequer, Quoted in Quigley, *Tragedy and Hope*, p. 61.)

Bankers Do Create Money

"I am afraid the ordinary citizen will not like to be told that the bankers can and do, create money... And they who control the credit of the nations direct the policy of Governments and hold in the hollow of their hands the destiny of the people." (Reginald McKenna, Quoted in *Tragedy and Hope*, p. 325.)

Corporate Monopolies Could Not Exist Without the Aid of Government

"Our thesis is that the current concentration level [of corporations] cannot be explained simply in terms of technological or economic imperatives. Monopoly is not the result of spontaneous generation or natural selection. On the contrary, it is often the outgrowth of unwise, discriminatory, privilege-creating governmental measures which throttle competition and restrict opportunity. It is the concomitant of unimaginative, shortsighted, or corrupt exercise of governmental power. Government today is, in many instances, a promoter of monopoly. It frequently puts together the very power concentrates which the anti-trust authorities are later called upon to break asunder. In short, government often supports, rather than

countervails, the forces making for concentration and monopoly. (Monopoly ... denotes an industry situation where a single firm or a small group of firms – by virtue of horizontal, vertical, or conglomerate integration – possess substantial economic power.)

"Given neutrality by the government, concentration could be reduced and competition enhanced in many industries. If government is to resist subversion by special interest groups, it must encourage a diffusion of power. If our goal is a free economy and a democratic society, government must maintain an arm's length relationship with business as well as other power concentrates. As Mr. Dooley so shrewdly observed: '... th' on'y thing to do is to keep pollyticians an' business men apart. They seem to have a bad infloonce on each other. Whiniver I see an alderman an' a banker walkin' down the street together I know th' Recordin' Angel will have to ordher another bottle iv ink.'

"... There appears to be under way a gradual but unmistakable retreat from the traditional anti-monopoly policy which for over three hundred years has prevailed in the Anglo-Saxon community toward an ambiguous and somewhat apologetic acceptance of monopoly as a necessary, even desirable, form of economic organization. This movement, long under way but proceeding slowly, has been accelerated in recent years, particularly since 1940, and now comes perilously close to the point of no return, where a reversal of direction becomes institutionally difficult, if not impossible, and the nation is committed irretrievably to a monopolistic way of life.

"This retrograde movement exacts a twofold price in terms of policy. With every backward step federal anti-trust policy becomes more debilitated, confused, and circumscribed, less vigorous in maintaining competition, less courageous in resisting the aggressions of monopoly; with every advance of monopoly toward greater economic power and more general social acceptance, the federal government becomes more subservient to it, more dependent on it, more disposed to favor it with grants of privilege, protection, and subsidy. The effect of these concomitant changes is to accelerate the decline of competition, on the one hand, and the aggrandizement of monopoly, on the other. The ultimate destination, if this trend continues, will be the abandonment of competition, both as an economic practice and as a social ideal, and the emergence of legalized private monopoly as the dominant form of economic organization. This is the familiar 'unification of political and economic power' exemplified by modern totalitarianism." (Walter Adams & Horace M. Gray, *Monopoly In America: the Government as Promoter*, New York: The Macmillan Company, 1955, pp. vii-viii, 1.)

Convergence of Capitalist and Communist Systems

"The Communists believe that the world will converge, but into an essentially communist form of government. In the West, on the other hand, the widespread

theory of convergence assumes that the fundamentally important aspects of the democratic system will be retained after America and Russia 'converge' at some future, indeterminate historical juncture. Although probably there will be more economic planning and social ownership in the West, the theory sees the Communist Party and its monopoly of power as the real victims of the historical process: both will fade away. Thus on closer examination it is striking to discover that most theories of the so-called convergence in reality posit not convergence but submergence of the opposite system. Hence the Western and the communist theories of convergence are basically revolutionary: both predict a revolutionary change in the character of one of the present systems. The Communists openly state it. In the West, it is implicit in the prevalent convergence argument.

"...The Soviet and the American political systems, each in its own way, have been highly successful. Because they have been successful, they are not likely to change drastically. Yet for the two systems to converge there would have to be a drastic alteration of course – in a historical sense, a revolutionary change of direction – in the path of development of one of them." (Zbigniew Brzezinski & Samuel P. Huntington, *Political Power: U.S.A./U.S.S.R. – Similarities and Contrasts – Convergence or evolution*. New York: The Viking Press, 1964, pp. 419, 136.)

The Creation of International Money

"... Central bankers have participated actively in the last years in the extensive discussions that have gone on concerning the next steps in the evolution of the international monetary system. These have focussed on the means of making the creation of international reserves a matter of international responsibility. I believe that sooner or later we shall have to take a major step forward in providing the machinery for creating reserves by deliberate collective action.... " (Louis Rasminsky, Governor, Bank of Canada, "The Role of the Central Banker Today," Per Jacobsson Lecture, November 6, 1966, Altieri Palace, Rome, Italy.)

Development of a New Imperial System to Govern the World

"The economic benefits of global integration will be unevenly spread and some areas will gain very little. The resulting inequality is likely to breed conflict. Moreover, even if multinational corporations distribute industrial production more evenly about the globe than is now the case, they will tend to centralize strategic decisions in regional coordinating centers and at global corporate headquarters. As Stephen Hymer put it, high level decision-making about what technologies and which areas to develop will be taken in a few key cities in the advanced countries, surrounded by regional sub-capitals, while the rest of the world will be confined 'to lower levels of activity and income, i.e., to the status of towns and villages in a new Imperial System....'" (Joseph Hye. Quoted in George W. Ball, ed., *Global*

Companies, the Political Economy of World Business, Englewood Cliffs, New Jersey: Prentice-Hall, Inc., 1975, p 162.)

Imposing International Rules on Nation-States

"The planners of the postwar international economic structure, under the leadership of the United States, were determined to move away from economic nationalism toward international cooperation and interdependence. To achieve these goals intergovernmental organizations were created with the authority to adopt rules of international behavior and to impose those rules on member states.

"These organizations were the International Trade Organization (ITO), the International Monetary Fund (IMF), and numerous others established for specific purposes, including the International Bank for Reconstruction and Development (or World Bank), the Food and Agricultural Organization (FAO), and the International Labor Organization (ILO). The ITO was to be the international institution for trade relations. Because the U.S. Senate failed to ratify the Havana Charter, the ITO was never born. As an interim measure, a General Agreement on tariff and Trade (GATT) was hurriedly negotiated and concluded in November 1947. This general Agreement embodied most of the principles that were to be the foundations of ITO. It is this 'interim measure' that provides again today the facilities for multilateral trade agreements and for the reduction of reciprocal tariffs among member countries. It is, thus, at the same time a multilateral agreement and an institution.... (Pierre Lortie, *Economic Integration and the Law of GATT*, New York: Prague Publishers, 1975, p. viii.)

Shaping a System That Embraces the Entire Global Community Including Russian and China

"We have to seek cooperation with the communist states, pointing eventually to a political and ultimately even philosophical accommodation with them. The differences that divide us are the products of 19th century thought, increasingly less relevant to the conditions of the 20th, not to speak of the 21st century. But at the same time, we have to be aware of realistic limits to the scope of possible cooperation with communist states at this time in history. In my own view, we are neither historically or philosophically prepared to engage jointly in a global architectural effort. We still need to seek cooperation step by step, functionally and regionally, as opportunity permits...

"The moment may be right for some joint American-Soviet arrangements in the Middle East. Certainly in SALT the strategic relationship is being codified by the United States and the Soviet Union. And there is room for much more trade with the communist states.

"But when it comes to the large, immediate, architectural issues of the day, it seems to me that the first priority still is that of the trilateral relations. It is here

where the philosophical basis preconditions for cooperation surely exist. It is clear, it seems to me, that there is the opportunity for real architecture and initiative. I thus see, in the emerging world, our three regions still representing the more cooperative, the more vital center. I would hope that because of this we would fashion new or additional procedures for more effective consultations, for the shaping of joint initiatives for the central and global problems of our times. I would hope to see the emergence of new political caucuses spanning our trilateral regions in some existing international institutions. But I would argue that the focus must not be the preservation of the status quo, but arrangements which increasingly co-op and embrace the Third and Fourth Worlds in a cooperative endeavor.

"This will be a very prolonged process. The international system created in 1945 was, so to speak, created through an act of will and human initiative in a relatively restricted period of time. This was possible because one power had overwhelming might and influence, and others were closely associated with it. In contrast, a renovated international system will now require a process of creation – much longer, much more complex – a process in which prolonged negotiations will have to be engaged and developed. It will require a process which recognizes the need for global adjustment in wealth, while creating additional wealth. It will, in any case, be a slow process....The process will clearly be a long one, and one has to anticipate enormous difficulties along the way.

"Nonetheless, we confront today an era of extraordinary opportunity, and an era to which democracies particularly ought to look forward with confidence. For all of the travails of our time, this century has been one of unprecedented progress. As the beginning of this century, approximately 1% of the world's population lived in conditions above those of minimum human survival. Today, with a population three times higher, 30% of the world's population has reached that level, and modern democracies have pioneered much of that progress. In 1945, existing democracies shaped an international system which has been particularly efficient and desirable from the standpoint of trilateral democracies. Today the challenge which we ought to welcome is to shape a system which embraces the entire global community, and our trilateral regions can find a special opportunity in moving towards that end." (Zbigniew Brzezinski, *Trilogue*, New York: The Trilateral Commission, 1975, No. 7, p. 13.)

Toward A Global Convergence with Russia

"Humankind is entering an era in which ideological rigidities are giving way to the pragmatism of nation-state competition. It is an era of convergence. Not so much a convergence of capitalism toward communism; nor a convergence of communism toward capitalism. Rather, the convergence is toward a model of the National Security State in which traditional ideology is a secondary factor in government policy. It is a convergence toward a corporate elite rule based on national security logic rather than ideology.

"For reasons given above, including the danger of an abrupt change of self-image, both superpowers can be expected to continue to deny (for another five years or more) that this convergence is happening. Meanwhile, both have their isolated New Classes who, under the rubric of national security, make decisions that profoundly determine the lives of the people.

"Both have their masses locked out of the decision-making process under the same rubric. Both are corporate states dominated by corporate goals. Both give verbal homage to their principal philosophers of human liberation (Marx and Jefferson) while precluding most of the humanistic values of these philosophers from the criteria for public policy." (Gerald and Patricia Mische, *Toward A Human World Order – Beyond the National Security Straitjacket*, New York: Paulish Press, 1977, pp. 164-165.)

Time Table For New World Order

"The time frame is in the final quarter of the twentieth century....

"Within this time frame, three phases are generally projected as marking progressive development toward world order: consciousness raising, politicization and transformation. A general strategy progression can be seen in relationship to these phases:

"I. Consciousness Raising

"The main strategy objective in this first phase is to develop widespread public consciousness about the WHY, WHAT and HOW of world order. The major effort is to enable citizens and leaders to see that true national interest and security and true personal interest and security lie in a world security system. A central focus is on the straitjacket of the present National Security State system and the powerlessness it engenders. Also included, however, is an awareness of alternative world order scenarios...and the practical dimensions of multi-issue coalition strategies....

"II. Politicization

"In this phase the question of world order moves into the sphere of politics as a public issue of true national interest and security. Building on the general consciousness raised in the first phase, the main strategy effort here is to mobilize grass-roots coalitions into effective movements for political change. When possible, the focus is on catalyzing 'the people' as agents of change. In democratically closed societies, however, the actors would be the New Class of managers and technical elites.

"The political task is a double one: to demonstrate to political leaders that 'the people' declare ownership in the world-order movement by contributing their own

insights and preferences in the conceptualization of the functional agencies of a world-order system.

"III. Transformation

"This is the period in which the various components of the world-order system take concrete form. A major focus here is to develop the functional agencies of a world-order system and delegate effective global authority needed by these agencies to accomplish their functions.

"Obviously these three phases are not mutually exclusive. The processes of consciousness raising, politicization and transformation, to varying degrees, are all already in evidence and will continue to be operative throughout the next twenty to twenty-five years. It is a question of emphasis. Consciousness raising about the WHY, WHAT and HOW of world order – already begun in many countries – will be predominant in the late 70's and early 80's but continue through the late 80's and 90's. Similarly, the politicization processes, evidenced now in limited form, will strengthen in the 80's and continue into the 90's. Transformation of the present world system, is also a process that will be operative throughout the next decades." (Gerald and Patricia Mische, *Toward A Human World Order – Beyond the National Security Straitjacket*, pp. 278-280.)

Limitation of National Sovereignty

"Every international agreement which amounts to anything involves some limitation of national sovereignty and interdependence will in the long run relegate this over-glamorized term to its relatively minor order of importance." (Sir Eric Wyndharn-White, *Beyond Diplomacy: Decision-making in an Interdependent World*, Policy Papers, Washington, D. C.: The Atlantic Council of the United States, no date, p. 83.)

A Period of Transition in the International Banking System

"... There is not now in place a permanent and operable worldwide monetary system with strong institutionalized safeguards to cushion and counter balance major disruptions. It is important not to overstate the problem, because negotiations are underway to fashion the outline of a new system or systems...." (F. Robert Abboud, Chairman. First Chicago Corporation, *Institutional Investor*, December 1979, p. 51.)

Steps Toward a Global Monetary System

"The impact of the European Monetary System and the International Monetary Fund's special drawing rights substitution accounts on the structure of markets will not be clear for quite some time. Both of these developments represent steps toward a global monetary system. The diminution of national control implied by

these developments is widely acknowledged as an obstacle to their acceptance. Indeed, international economic integration in whatever form necessarily results in a loss of a measure of control over national markets and institutions...." (John G. Heimann, Comptroller of the U.S. Currency, *Institutional Investor*, December 1979, p. 136.)

America Has Lost Its Economic and Financial Independence

"More than two hundred years after the Declaration of Independence, the United States has lost its position as an independent power.... Out increasing dependence on foreign capital is not just an economic issue. It is also a security issue, as well as a political issue with major implications for foreign and domestic policy.... This country will not be able to deal politically with its economic problems until a simple, basic requirement is recognized: to recapture our lost financial independence." (Felix Rohatyn, "Restoring American Independence: *New York Review of Books*, February 18, 1988.)

Creating the Nucleus of a New World Economic Order

"The proposal I ask you to consider is that we begin to seek the ways and means of lowering all economic barriers between North America, Europe, and Japan – trade, investment, legal, and so forth – in order to begin creating the nucleus of a new world economic order that would include a harmonized world business system with agreed rules and procedures that transcend national boundaries. You, as political leaders, have the power to take the steps necessary to make the increasing de facto globalization of business the most creative, positive, and beneficial force it can be, rather than the source of new international conflict. I believe that if we can go down this road together, we will also establish the basis for a much more equitable sharing of the burdens, responsibilities, and cost of international leadership....

"During the Gulf War, U. S. President George Bush spoke about the need for a "new world order." What he meant by that was a new political and military – security order to deal with the challenges of the post-Cold -War period. Certainly we need that. But the world also needs a new economic order, focused on international economic security." (Akito Morita, Chairman, Sony Corporation. Open Letter to the G-7 Leaders – the Presidents and Prime Ministers of the United States, Japan, German, France, Britain, Italy, and Canada (*Atlantic Monthly*, June, 1993, pp. 88-89.)

Preparing the Global International System for the Millennium

"Never before have so many structural changes in the international system occurred simultaneously. Some elements are now global – for example, economics and communications – while politics remains confined to the nation-state or is reduced to ethnic units....

"Let me focus on three areas likely to present the greatest challenges in the next century: Asia, the Persian Gulf, and the transatlantic region encompassing the NATO countries and the territory of the former Soviet bloc.

"In Asia, China will emerge as an incipient superpower. When it reaches the per capita income of South Korea (about a third of ours), its GNP will be double that of the United States. Such an economic colossus is bound to have a major impact. China's vast market, reinforced by its growing military power, will, in the hands of skillful and determined leaders, provide a vehicle for growing influence....

"For the first time in its history, China is tied to the world economy and a global international system....

"Discussion about the Middle East tend to focus almost exclusively on the Arab-Israel issue. While it is demonstrably explosive, there exists an established and tested framework for dealing with it. Below the surface of the Gulf, however, lurk even more dangerous structural issues. There, states of very limited power possess the capacity to cause nearly infinite international damage. When, in 1973, the Gulf states found themselves in a position to raise oil prices by 387 percent in a three-month period, they triggered a 10-year financial and economic crisis that threatened the global economic and financial systems and undermined the governability of the industrial democracies.

"Today the consequences of a crisis in the Gulf are no less ominous. But the structure on which its stability depends is even more brittle. The two strongest nations – Iran and Iraq – are outlaw states....

"But if we can find no way to modify the building blocks in the Persian Gulf, we had better prepare ourselves for an inevitable blow-up....

"The return of Russia to a major international role will be another seminal event. Early in the next century, after many ups and downs, Russia is likely to have restored its central authority. It may well be closer to the political structures favored by Pinochet or Salazar than to a Western pluralistic system – though it will be freer than communism. Once a legal system is established and a measure of predictability introduced, the economy should recover as well.

"At that point, the nations bordering the Atlantic will have to get used to a far more assertive Russia. The task of the Atlantic Alliance will become to give Russia an opportunity to participate fully in the political constructions of the new millennium, while ensuring that its traditional nationalism does not spill across its borders....

"The enlargement of NATO to include the former Soviet satellites in Central Europe can provide the essential safety net for this task. At the same time a body for political cooperation embracing the key members of the Atlantic Alliance plus

Russia must also be created. The appropriate forum for this is the Organization for Security and Cooperation in Europe....

"Whatever my doubts about the suitability of economic sanctions for spreading democracy in Asia, I consider it essential to promote the democratic ideal by fostering close cooperation where it already exists, especially among the nations bordering the Atlantic and within the Western Hemisphere. Military conflict among these nations is nearly inconceivable. It is among the established democracies that we should reinforce the values and institutions we treasure. The Western Hemisphere Economic Free Trade Area ... and its ultimate merging into an Atlantic Free Trade Area are crucial steps toward realizing these goals.

"The American foreign policy challenge for the next millennium is different from anything in our previous experience.... In the period ahead our biggest challenge will be to help construct a system in which the rewards and penalties are conducive to a broader sense of global well-being...." (Henry A. Kissinger. *Newsweek*, January 27, 1997, pp. 74, 77-81.)

Foreword

iii. The Emerging System of Global Governance – A Review of Current Literature

Leading Futurist Believes That the U. S. Constitution is Obsolete and Should Be Replaced

"To the Founding Parents:

"You are the revolutionists dead. You are the men and women, the farmers, merchants, artisans, lawyers, printers, pamphleteers, shopkeepers, and soldiers who together created a new nation on the distant shores of America. You include the fifty-five who came together in 1787 to hammer out, during a broiling summer in Philadelphia, that astonishing document called the Constitution of the United States. You are the inventors of a future that became my present.

"That piece of paper, with the Bill of Rights added in 1791, is clearly one of the stunning achievements of human history. I, like so many others, am continually forced to ask myself how you managed – how you were able, in the midst of bitter social and economic turmoil, under the most immediate pressures – to muster so much awareness of the emerging future. Listening to the distant sounds of tomorrow, you sensed that a civilization was dying and a new one was being born.

"I conclude you were driven to it – were compelled, carried along by the tidal force of events, fearing the collapse of an ineffectual government paralyzed by inappropriate principles and obsolete structures.

"Seldom has so majestic a piece of work been done by men of such sharply divergent temperaments – brilliant, antagonistic, and egotistic men – men passionately committed to diverse regional and economic interests, yet so upset and outraged by the terrible 'inefficiencies' of an existing government as to draw together and propose a radically new one based on startling principles.

"Even now these principles move me, as they have moved countless millions around the planet. I confess it difficult for me to read certain passages of Jefferson or Paine, for example, without being brought to the edge of tears by their beauty and meaning.

"I want to thank you, the revolutionary dead, for having made possible for me a half-century of life as an American citizen under a government of laws, not men, and particularly for the precious Bill of Rights, which has made it possible for me to think, to express unpopular views, however foolish or mistaken at times – indeed, to write what follows without fear of suppression.

"For what I now must write can all too easily be misunderstood by my contemporaries. Some will no doubt regard it as seditious. Yet it is a painful truth I believe you would have quickly grasped. For the system of government you fashioned, including the very principles on which you based it, is increasingly obsolete, and hence increasingly, if inadvertently, oppressive and dangerous to our welfare. It must be radically changed and a new system of government invented – a democracy for the twenty-first century.

"You knew, better than we today, that no government, no political system, no constitution, no charter or state is permanent, nor can the decisions of the past bind the future forever. Nor can a government designed for one civilization cope adequately with the next.

"You would have understood, therefore, why even the Constitution of the United States needs to be reconsidered, and altered – not to cut the federal budget or to embody this or that narrow principle, but to expand its Bill of Rights, taking account of threats to freedom unimagined in the past, and to create a whole new structure of government capable of making intelligent, democratic decisions necessary for our survival in a new world.

"I come with no easy blueprint for tomorrow's constitution. I mistrust those who think they already have the answers when we are still trying to formulate the questions. But the time has come for us to imagine completely novel alternatives, to discuss, dissent, debate, and design, from the ground up, the democratic architecture of tomorrow.

"Not in a spirit of anger or dogmatism, not in a sudden impulsive spasm, but through the widest consultation and peaceful public participation, we need to join together to reconstitute America.

"You would have understood this need. For it was one of your generation – Jefferson – who, in mature reflection, declared: 'Some men look at constitutions with sanctimonious reverence and deem them like the ark of the covenant, too sacred to be touched. They ascribe to the men of the preceding age a wisdom more than human, and suppose what they did to be beyond amendment.... I am certainly not an advocate for frequent and untried changes in laws and constitutions . . . But I also know that laws and institutions must go hand in hand with the progress of the human mind.... As new discoveries are made, new truths disclosed, and manners and opinions change with the change of circumstances, institutions must advance also, and keep pace with the times.'

"For this wisdom, above all, I thank Mr. Jefferson, who helped create the system that served us so well for so long, and that now must, in its turn, die and be replaced.

"An imaginary letter . . . Surely in many nations there must be others who, given the opportunity, would express similar sentiments. For the obsolescence of many of today's governments is not some secret I alone have discovered. Nor is it a disease of America alone.

"The fact is that building a new civilization on the wreckage of the old involves the design of new, more appropriate political structures in many nations at once. This is a painful yet necessary project that is mind-staggering in scope and will no doubt take decades to complete.

"In all likelihood it will require a protracted battle to radically overhaul – or even scrap – the United States Congress, the Central Committees and Politburos of the Communist industrial states, the House of Commons and the House of Lords, the French Chamber of Deputies, the Bundestag, the Diet, the giant ministries and entrenched civil services of many nations, the constitutions and court systems – in short, much of the unwieldy and increasingly unworkable apparatus of supposedly representative governments.

"Nor will this wave of political struggle stop at the national level. Over the months and decades ahead, the entire 'global law machine' – from the United Nations at one end to the local city or town council at the other – will eventually face a mounting, ultimately irresistible, demand for restructuring.

"All these structures will have to be fundamentally altered, not because they are inherently evil, nor even because they are controlled by this or that class or group, but because they are increasingly unworkable – no longer fitted to the needs of a radically changed world.

"This task will involve multimillions of people. If this radical overhaul is rigidly resisted it may well trigger bloodshed. How peaceful the process turns out to be will depend on many factors, therefore – on how flexible or intransigent the

existing elites prove to be, on whether the change is accelerated by economic collapse, on whether or not external threats and military interventions occur. Clearly the risks are great.

"Yet the risks of not overhauling our political institutions are even greater, and the sooner we begin, the safer we all will be.

"To build workable governments anew – and to carry out what may well be the most important political task of our lifetimes – we will have to strip away the accumulated clichés of the Second Wave era....

"We need far better agencies to regulate out-of-control currencies. We shall need alternatives to – or complete transformations of – the IMF, the World Bank, COMECON, NATO, and other such institutions. We shall have to invent new agencies to spread the advantages and limit the side effects of technology. We must speed the construction of strong transnational agencies for governing outer space and the oceans. We shall have to overhaul the ossified, bureaucratic United Nations from the ground floor up...." (Alvin Toffler, *The Third Wave*, Bantam Books, New York, 1980, pp. 416-419, 432.) (See also Alvin & Heidi Toffler, *Creating a New Civilization: the Politics of the Third Wave*. Washington, D. C.: The Progress and Freedom Foundation. 1974, pp. 73-75.)

The International Banker Has Played An Important Role for Over Two Centuries

"In the last two centuries it is the financier far more than the artist or the industrialist whose influence has been unquestionable: the man who directly or indirectly finances princes. Like the priest or man at arms of earlier times, he gambles on the development of events and power and attempts to use his influence to bring about the outcome he desires. He supplies men of ambition with the material means to their ends, and in order to be sure of his due, seeks to predict what will be the state of the world at the point when he expects to recover his loan. However, his hopes are based on reason, which must lay the groundwork for the accuracy of his calculations: the financier is not a speculator. He does not gamble, he reasons. This has often been the cause of his ruin in the face of the madness of those in power.

"No doubt some will be surprised to see cropping up here in the forefront of history, in the narrow margin left between the actions of nations and the whims of tyrants, a galaxy of almost unknown people of great talent and strong character. They were almost always very rich, though not always very ethical, linked to each other in a close and almost dynastic network – a parallel aristocracy lodged at the head of every regime. It may also be something of a surprise to discover for better or worse, the Warburgs, Rothschilds, Schiffs, Lehmans, Melchoirs, Hambros and Mayers have played as great a role as the princes and politicians in our destiny –

not to mention the part played by the Bards, Fuggers, Morgans or Barings, or individuals like Abs, Monnet, Caccia or Rockefeller.

"These strange and enigmatic men of influence have always had to try to look far into the future, to imagine new sources of wealth, to get money into circulation so to prevent it becoming worthless in times of war. Sometimes they have been mistaken, deluded by their own unbounded ambition, and have had a hand in the ruin of their world. Occasionally, too, they have seen the arrival of a worse catastrophe than the one they had delayed – either because the reciprocal cancellation of debts and wealth required it, in hatred of the lender, or because reason was shattered by ideology. As pioneers of capitalist rationalism and founding witnesses of the merchant order, they are essential links in our history and a magnificent reflection of the relative powers of money and reason." (Jacques Attali, *A Man of Influence: Sir Siegmund Warburg, 1902-82*, London: Weidenfeld and Nicolson, 1986, pp. 5-6.)

British Merchant Banks Become Bankers to Europe and America

"London was then [1853] at the heart of Western capitalism and dominated world industry. Its bankers, insurers, shipowners and captains of industry supplied the country with raw materials and organized the export of textiles, machinery and capital. Britain produced more than half the world's industrial goods and the increasing earnings of its shipping fleet, its banks, insurers and merchants more than compensated for its external trade deficit which was worsening throughout the century. These surpluses were not invested in industry, however, but directly abroad and earned even more, to the point where income on capital alone came to balance the trade deficit. The surpluses fed the extensive need for capital of the woollen and cotton mills, the shipyards, steelworks, railways, paper mills and rubber manufacturers of the whole world.

"London's business centre, known as the City, became the major world foreign exchange warehouse. The pound attained the status of an international currency, even draining off savings from the Continent to finance the industrialization of faraway countries. The City consisted of many increasingly distinct professions: alongside the commercial banks, special departments or separate merchants banks were developing, lending over the long term and advising commercial concerns. In order to buy or sell British shares on the Stock Exchange, these banks had to go through the intermediary brokers and jobbers, although they could operate freely in foreign shares.

"The British merchant banks thus became bankers to the great of Europe and America: Barings, founded in 1762, was official financier not only to the imperial family and government of Russia, but to the whole of South America. The English Rothschilds fixed the world price of gold and financed most of the governments of Europe. Morgan Grenfell, founded in 1833, forged links with the United States

through the Morgan family which had emigrated there, and managed British investments in America. Hambros Bank, named after a family which had come from Altona at the beginning of the century, took up an interest in Scandinavia, where it had originated.

"Things were becoming organized. In 1844 a law introduced by Robert Peel gave the Bank of England a monopoly on the issue of banknotes, banned the creation of any other issuing institutions and defined the steps to be taken to maintain the country's gold reserves.

"Amsterdam, Hamburg and Paris received their share of the money from England, and thanks to this were able to finance ventures in Northern Europe, Germany and Russia. At this time also the United States saw the birth of firms specializing in long-term lending to companies and advice to shareholders, which took British money and drew off local savings. The first of these investment banks, the American form of merchant bank, was set up in 1826 in New York by Nathaniel Prime; the second, set up in 1830 in Baltimore was Alex Brown and Sons. The same year Vermilye and Co. made its appearance, and a little later Jay Cooke set up his bank in Philadelphia.

"During those years a number of German[s]... arrived in the United States to do business and some later became investment bankers, as for instance the three Lehman brothers – Henry, Emmanuel and Mayer – who went from Frankfurt to open a cotton-broking business first in Alabama, then in New Orleans and New York, before launching themselves into banking." (Attali, *A Man of Influence*, pp. 25-26.)

The Rise of Investment Banking in America

"In America the mid nineteenth century saw the first appearance of those who would be the leaders of investment banking, such as the Morgans who organized British investment in America, and others like Kidder Peabody. In addition, after the riots of 1848 a number of German[s]... left for America and became bankers alongside Speyer, Belmont, Lehman and Salinger who were already established there. At first they financed the federal government during and after the Civil War, then became a way station for capital coming from Europe to finance the development of the American continent.

"So it was that two brothers-in-law, Abraham Kuhn and Salomon Loeb, left Worms around 1850, to be wholesale textile merchants in Cincinnati. On 1 February 1867 they made their way to New York with the \$500,000 they had earned and set up a bank at 31 Nassau Street. It was a well-timed move: the Civil War had finished, the steelworks were built and the telegraph operated across the whole continent. The railways under construction opened up enormous sources of profit for the banks. The Union Pacific was progressing westwards and the Central Pacific eastwards, and the federal government put \$60 million at their disposal for

the purchase of land. The banks were needed to organize groups of investors to finance the rest of the operation, and there was much money to be made from forming 'syndicates' of potential lenders and charging commission on these loans.

"This led to some degree of specialization in certain sectors among the banks: Jay Cooke, J. P. Morgan and Kuhn Loeb made loans to railways and steelworks, while Lehmann Brothers and Goldman Sachs financed the distribution of goods. The first guaranteed placing was carried out in 1869 by Jay Cooke for a loan of \$2 million to the Pennsylvania Railroad. So as to pull in savings from Europe the American banks strengthened their agreements with London banks, for example, J. P. Morgan with Morgan Grenfell, Kidder Peabody with George Peabody, Kuhn Loeb with Rothschild.

"In the opposite direction, European banks began to establish offices in New York and Boston, and other German...bankers, attracted by American expansion, emigrated to these two cities; the Guggenheims, Morgenthau and Lewisohns all opened businesses with great expectations....Attali, *A Man of Influence*, pp. 31-32.)

International Banking Develops into a Dynastic Elite Based on Culture and Money

"Banks had by then [1930] reached the top of the social scale. Starting off amongst the commercial professions in the eighteenth century, and supporting industry during the nineteenth, they developed by the beginning of the twentieth century into a dynastic elite based on culture as well as money.

"It was primarily an elite of money: here was where the great fortunes of Europe were to be found – no longer only in cotton, railways industry or land, though Friedrich Krupp was still by far the richest German of the age, richer than the Emperor himself.

"However, it was also a cultural elite; as though this profession which used intelligence and watched for signs predisposed adepts towards the sophisticated use of wealth.

"In the end their taste for power led them to copy the style of the dynasties they served; firstly and most visibly by using their name as a means of marking out territory. Their alliances were therefore still very carefully studied: marriages were between banking families...in order to extend empires, avoid their break-up and keep business secrets within the narrowest possible circle. The rare departures from this rule always caused a sensation....

"However, wealth gave the young dynasties not power, but only influence over the men in power. Admittedly everywhere in Europe and in the United States investment rather than commercial bankers...were doing their best to play a direct political role. The Barings, the Gibbs, the Smiths, the Hottingers and the

Bleichroeders joined openly in the politics of the young democracies: as liberals to defend the opening up of international trade, conservatives to defend their wealth, reformers to bring about the mobility of capital and cultural and social modernization. Through their loans they did all they could to keep the economy going, striving to speed up growth so as to finance repayment, and unintentionally even causing a war to organize a moratorium on debts....

"Elsewhere on the old Continent the situation was different. The German banks increasingly financed their own industry, from M. M. Warburg to the Deutsche Bank, from Stein to the Berliner Handels-Gesellschaft, whether they were general banks or dealt only in investments, and whether they had one cashier's desk or five hundred. In France, too, the investment banks made direct loans to French companies, even though the Rothschilds or the Hottingers drew the main part of their income from financing foreign trade and the budget deficit. Austrian bankers financed the industry of the Ottoman Empire: Moritz de Hirsch, for example, financed the Orient Express from Vienna.

"The United States, still a debtor nation, attracted as much capital as possible from Europe, and with this capital its investment banks wielded enormous power in a country where money was already of major importance. John Pierpont Morgan had succeeded his father and set up a new subsidiary, Drexel, Morgan & Co. He financed the railways and organized General Electric and US Steel. At the time he was undoubtedly more influential in the development of America than the President of the United States himself. In 1901 a battle for control of Northern Pacific Railways brought him up against the other great Wall Street operator, Jacob Schiff. Each of them tried to buy shares from big holders. In five days the stock went from \$110 to \$1,000 and the whole Stock Exchange was in uproar. When Rockefeller sided with Morgan, he won and increased his enormous fortune. (Attali, *A Man of Influence*, pp. 48-50.)

Paul Warburg – A Prominent German Develops Plans for the Federal Reserve System

"At the beginning of the century the United States became a great power and the dollar a great currency. The latter was based on gold, even though the Gold Standard Act of 1900 did not completely exclude silver, with its limited striking, from the American monetary system.

"So, the same way that every nation which becomes a storehouse of goods soon becomes a storehouse of money, twenty years after its rise to industrial power America, making more profits than it could use at home, began to invest and lend its currency to companies or other countries. The investment banks of Boston and New York not only continued borrowing from Europe to lend to America, but also began to operate in the reverse direction.

"Kuhn Loeb, for example, was still importing a lot of European capital to finance American industry; in 1906 it borrowed \$48 million in France to finance the Pennsylvania Railroad and in 1909 was the intermediary through which a French group loaned \$5 million to the Southern Pacific. In order to do this, Schiff used his links with Rothschild and Warburg. However, in the reverse direction, Kuhn Loeb also invested American money in loans for Shell and for the governments of Sweden, Germany and Japan.

"At the time of this reversal of financial flows which was to last three-quarters of a century, the American banking system was still very rudimentary. There was no central organization; the banks, whatever their activity, set up anywhere they wanted to and their growing interconnection made their failures contagious. Since the 1880 crisis about twenty of the biggest banks in the country had made a habit of consulting together regularly to harmonize their policies. However, there was no mutual guarantee, and no control over the issuing of banknotes, so when banking panics broke out they led to numerous bankruptcies which it was difficult to limit.

"In place of this, Paul Warburg suggested to Jacob Schiff in 1903 the creation of a control system on German lines. On the eve of becoming an American citizen he published a short book, *Plan for a Central Bank*, in which he suggested – in the image of what had existed in the German Empire since 1875 – the creation of a Central Bank, serving as a mutual guarantee to the private banks, and owned in equal shares by the Government, the big private banks and about ten regional federal banks which would alone be authorized to issue banknotes, backed by gold and nothing else. His plan aroused much interest on Wall Street and in Washington and Paul gave many lectures on the subject in the United States. But he was only a rich German banker living six months of the year in New York. His plan was not put into effect.

"Everything changed in the autumn of 1907. The collapse of the Kinckerbocker Trust Co. and the threat hovering over Trust Company of America brought about a particularly severe crisis: the banks were accused of making too much money by giving ill-considered loans and of not having foreseen the crisis. Paul's plan became topical again.

"In 1910, at the age of forty-two and after many hesitations, he finally became an American citizen. That same year the Association of New York Bankers gave official support to his plan, which he was continuing to defend everywhere. Though the previous President, Theodore Roosevelt, had not consulted him, Nelson Aldrich, a senator from Rhode Island, saw him often and took an interest in his ideas. Aldrich, the father-in-law of J. D. Rockefeller, Jr. was an adviser to the current President Taft and chairman of the National Monetary Commission of which Paul [Warburg] was also a member. In addition, the financial situation in America was beginning to be problematical and the banks were gradually being placed under supervision.

"In 1912 the Monetary Trust Investigation Committee of the Senate investigated the activities of Kuhn Loeb, J. P. Morgan, Kidder, Lee Higginson and the National City Bank. Some states passed laws to control banks.

"In November 1912 President Wilson, only just elected against Taft and Roosevelt, asked Paul [Warburg] to draft a law based on his book, and was pleased with the result. He decided to submit it to the Senate as quickly as possible. Everything was settled at a secret meeting at the beginning of 1913 at Sea Island, Georgia, between Paul Warburg, the president of the National City Bank of New York and Senator Aldrich. The bill drafted by Paul was introduced to the Senate by Robert Owen and to Congress by a representative from Virginia, Carter Glass, and thus became the Owen Glass Act. Passed in the summer of 1913, it set up twelve regional reserve banks and one federal reserve bank in Washington.

"A bridge between Germany and the United States, Paul thus managed to organize the American banking system in German style. The main architect of this structure, he was proposed by Wilson for the chairmanship of the Federal Reserve Bank. But as a German ... only just naturalized, he declined this, and would accept only a vice chairmanship, though another chairman had not been appointed. Benjamin Strong, the son-in-law of J. Pierpont Morgan who died that same year, was appointed to the chairmanship of the regional bank of New York, immediate rival of the central bank." (Attali, *A Man of Influence*, pp. 52-54.)

International Bankers Finance Japanese War with Russia

"At the beginning of the century Japan was forcing the pace of its modernization. Robbed of its conquests in China in 1894, it attacked Russia on 8 February 1904 without declaring war. To the amazement of the Europeans, Japan then revealed itself as a modern military power, but in order to win it needed money and a vice-governor of the Bank of Japan and financial commissioner to the Japanese Government, Baron Korekiho Takahashi, was sent to London and New York in June 1904 to ask the bankers of Europe and America to subscribe to a loan to the imperial Japanese Government of L30 million sterling at 4.5 per cent. Jacob Schiff had been trying to arrange a financial blockade of the Tsar, whom he had called 'the enemy of humanity' since the programs of 1894, and agreed with pleasure to finance this war. That year he even refused to participate in a Wall Street loan to France for fear that the money might go to the Russians, who were great borrowers in Paris at that time. Jacob Schiff then wrote to Max Warburg to ask him to join in the loan to Japan. Max as always checked with the Ministry of Foreign Affairs that such a loan would not go against the foreign policy of Berlin, and noted in his diary: 'I did what every good banker would do in this case: I went to the Ministry of Foreign Affairs in Berlin.' He was immediately given the green light, as Krupp, who was then playing an extensive role in affairs of state, hoped that this participation in the loan would lead to orders for arms from Japan to Germany.

"Max then received Korekiho Takahashi, sent to him by Jacob [Schiff]. On 28 March 1905 he undertook to place £1 million of the loan. He immediately placed £900,000 in Germany, which made him big money, since M. M. Warburg earned a commission equal to 1.5 per cent of the amount of the loan.

"On 11 July of the same year, just as the war began to turn in its favour, Japan floated a second loan, this time of £30 million. M. M. Warburg, in association with the Deutsch Asiatische Bank, undertook to place one-third in Germany itself. It was a huge success: the loan was ten times oversubscribed. A few months later Japan's victory was complete and the Portsmouth treaty awarded her control of Manchuria and Korea.

"Max Warburg and Jacob Schiff then became officially appointed suppliers of capital to Japan. The following year John Schiff made a triumphal tour of the country and the daughter of Baron Takahashi went to live with the Schiffs in New York for several years. Takahashi himself later became Finance Minister, then Prime Minister before being assassinated in 1936.

"Max and Jacob [Warburg] also became industrial advisers to the great family groups in Japan. In 1906 Baron Mitsui, the owner of a large part of Japanese industry, went to Hamburg by the Trans-Siberian railway in order to meet Max. As family tradition has it, the conversation went like this:

"Mitsui: We are a great family with many business interests, and so are you. Tell me, how do you manage not to fight amongst yourselves?

"Max: To tell the truth we do fight among ourselves, all the time.

"Mitsui: I did not come all the way across Siberia to hear that!

"Max: Let's be serious. To avoid problems, I advise you to group all your family's activities into one holding company and to give control to a single authority. We Warburgs did this long ago, and it is working very well.

"Thus was born the Mitsui group, one of the foremost in Japan.... (Attali, *A Man of Influence*, pp. 54-55.)

Max Warburg Helps Finance Military Buildup of Germany

"Europe slid slowly towards another war, yet it was neither necessary nor inevitable. Russia, France and Britain became allies. Germany and Austria feared that Russia would carve up the Turkish Empire, where the nationalities were restive, to its own advantage. North and South Germany did not always have the same attitudes: the industrial capitalism of the Ruhr chose the prospect of war which could alone – it was thought-keep the factories working at full capacity. The more financial North, turned more towards the Atlantic, was hostile to war: Max

[Warburg] thought that a war would kill 'his' Germany and did his utmost to oppose the Ruhr in Berlin. However, the fact is that like the whole of German banking, Max himself was not without responsibility in the circumstances which were to lead to war. To keep up his profits he actually lent money to industry and to the state to finance armaments. (Attali, *A Man of Influence*, p. 59.)

The Reasons for World War I

"In 1912 the hostilities between Italy and the Ottoman Empire, and the first Balkan War, exercised both men and armies. Then the size of the forces on either side of the Rhine increased. From then on, Conrad von Hotzendorff, chief of staff of the Austrian army, and Moltke, who had just replaced Schlieffen at the head of the German army, wanted a quick war. They knew that Britain did not yet have an army worthy of the name, and that France had disturbingly been rebuilding its own for some time. Chancellor Bethmann-Hollweg was also on the side of those who wanted to wage war in Europe in order to gain territory, give work to industry and maintain the social order." (Attali, *A Man of Influence*, pp. 59-60.)

The Beginning of World War I

"In June 1914 all the armies of Europe were on the alert and the economies of the Continent were working only for them or through them. Peace was at the mercy of an incident, and that one should occur was in the interest of many. Max went to London three times, twice at the beginning of the month, then again on 27 June, after a discussion with the Chancellor and the Kaiser on 14 June in Hamburg on the best way to avoid an Anglo-German war. On 28 June the assassination in Sarajevo, Bosnia, of a liberal Austrian prince, Archduke Franz-Ferdinand, a nephew of the Kaiser, allegedly by a Serb, passed almost unnoticed. The next day, as he did every year, the Kaiser left for the Kiel regatta, the Chancellor was on holiday and Moltke was taking the waters at Carlsbad. However, still convinced of British neutrality, Bethmann-Hollweg and the German general staff thought to profit from the incident by launching a lightning attack on Serbia, then on Russia, supporting an Austrian response to the assassination to 'finish the Serbs'. However, the Austrians did not seem decided on a battle and it was difficult for Germany to declare war if the ally 'offended' by the outrage had not done so itself.

"At the end of July, a strange month of waiting with everything at stake, the Kaiser met Max once more in Kiel: 'Should we declare war or wait, Mr. Warburg?' 'Wait, Sire. Every year of peace strengthens Germany and gives us more means of winning. Waiting can only be beneficial.'

"Max knew then that war was inevitable, for there were too many pressures in favour of it and the Kaiser had weakened. He knew that 'his' Germany was almost certainly finished. Resignedly he cut back his operations and cashed in his securities, before the Stock Exchange fell as he predicted. On 28 July the cable link between Germany and the United States was cut. Max Warburg moved his London

representative, Pieter Vuyk, to Amsterdam. On the same day Austria, urged on by Bethmann-Hollweg, finally declared war on Serbia.

"The war began in confusion: Serbia believed it was supported by Russia, which in turn believed it had French support. On 30 July Russia mobilized the whole of its army, the Tsar having been convinced by his general staff that partial mobilization was impossible. Seeing this, Austria did the same on 31 July. That evening Jaures was assassinated at the Cafe du Croissant in Paris. The dice were rolling.

"The same day there was a rush for gold on all the European exchanges and currency rates fell. The Hamburg exchange was closed. The world's leading currencies suspended convertibility to gold and began to float: the barely established gold standard was thus inoperative. It would only be restored for a few short years long after this war.

"In Germany companies asked the state for a moratorium on their debts. On 1 August Max, [Warburg] with other banks, tried his best to calm the situation. But things had gone too far. That day, Germany declared war on Russia and on 3 August on France; on 5 August Austria declared war on Russia. At the beginning of August the Germans still believed that Great Britain would not enter the conflict against them. When on 12 and 13 August Paris and then London declared war on Austria, this was the beginning for the European Continent of what would become the First World War, with an absurd celebration of arms, the dismay of financiers, the misery of nations and, soon, the twilight of the eagles.

"The German press, largely controlled by Ruhr industrialists, mobilized public opinion and created a special association. This tried to obtain, from the banks and the Government, cheap loans and a moratorium on debts. On 6 August Max Warburg and other great bankers called to Berlin by the Chancellor opposed any general moratorium which they said would ruin the banks or require huge public spending to support them. Instead, Max proposed the establishment of banks specializing in 'war lending', that is with more flexible lending rules and lower rates than others. Bethmann took up the idea and imposed it on the Ruhr. Carl Melchior and Max Warburg set up the first bank of this kind, the Hamburgische Bank; others followed throughout Germany." (Atalli, *A Man of Influence*, pp. 60-61.)

International Bankers Finance Both Sides of World War I

"America was still benefiting from the war of others and did not yet wish to take sides: she was selling wheat, raw materials, machinery and arms to both sides. Her banks competed in ingenuity in lending money to whoever wanted it, in exchange for huge commissions. Even Kuhn Loeb, heavily committed to the German side, was attracted by the huge profits to be made and issued loans for the British Royal Dutch Petroleum and for the big French cities (Paris, Bordeaux,

Lyon and Marseilles) alongside the loans it continued to make to Germany and to the big American companies (Westinghouse, American Smelting and Refining Co., Baldwin Locomotive Works, US Leather Co., US Rubber Co., Western Union Telegraph)." (Attali, *A Man of Influence*, pp. 66-67.)

Warburg Bank Helps Finance World War I

"Never has our financial destiny been so closely linked to the political destiny of Germany. This has clearly demonstrated the invalidity of the idea that a private company can remain independent of the political and economic situation of the Empire in time of war. Probably no single German private bank has guarantee more German Empire loans than we have. From this point of view, we have certainly contributed to financing the war, particularly by giving our guarantee for purchases from neutral countries." (Max Warburg, Diary, quoted in Attali, *A Man of Influence*, p. 69.)

Development of an International Central Bank

"On 15 June 1919, even before the signature of the Treaty of Versailles, Max [Warburg] and Melchior returned to Hamburg disappointed, humiliated and worried to rebuild the drained bank. In June 1919, as Max von Baden has done in October 1918, Ebert asked Max and then Melchior to become Finance Minister in the Bauer Government. Each refused in order to return to work at M. M. Warburg which was then in great difficulty. They had to find employees, re-establish contact with clients and, even more urgent, obtain payment of overdue debts. This was almost impossible and Max was in anguish. As he had predicted in 1917, without new capital his bank was headed for failure. Where could he find money except in America? He therefore wrote to his two brothers to ask them to come and see him, and help him. Paul and Felix did not hesitate and came to Europe. Max arranged to meet them in Switzerland where he was sent by Scheidemann in July to request a loan for Germany from the Swiss Government and banks. The three brothers met in St. Moritz in August 1919 for the first time in six years. Max asked them for 6 million marks, a huge amount, to save the bank. Paul and Felix advised him not to be obstinate, but to close down the bank and join them in America.

"Germany is lost as you well know – you refused to sign at Versailles. Europe will go backwards and tip over into Communism. What are you staying for?"

'No. Look, we shall become a great bank again and Hamburg will be the new capital of industrial Germany.'

"They parted without coming to a decision. Felix went back to New York. Paul [Warburg] stayed on in Europe for some time, in search of a part to play in organizing the financing of European debt. For him this problem was likely to lead to a world catastrophe if it was not treated in the same way as the problem he had contributed to solving in America itself [Federal Reserve Bank]: instead of lending

to Europe over the short term, a sort of international central bank should be established, to organize these movements of capital in the form of long-term loans.

"He believed this would not be done without bringing in private as well as public funds, public and private banks. He went to Basel, then Amsterdam where at the beginning of October and partly on his initiative a group of British, French, American and German bankers and academics met for the first time since the war (among them [John Maynard] Keynes and Max Warburg). They discussed the coming reparations and their consequences for the European economy. Paul floated the idea of a bank specializing in financing the reparations, which would be used to revive international trade. Several institutions were to be born from this idea, including today's Bank for International Settlements and the World Bank.

"His plan was much discussed during the Amsterdam meeting, but without any immediate result. On 12 October Keynes, who was still there, telegraphed Melchior in Hamburg asking him to come and see him. On 15 October Melchior arrived and introduced Keynes to Paul Warburg. The next day all three went walking in the city, which Melchior knew well from the time when he had negotiated loans for Germany, then at war....

"The Amsterdam meeting greatly affected all those who took part in it. All the bankers present, seers of their world, saw the urgent need to link Germany with the Allies, put Europe back on its feet and get out of the mesh of short-term debts by consolidating them. (Attali, *A Man of Influence*, pp. 79-80.)

American Taxpayer's Dollars Used to Rebuild Europe

"America now wanted to help Germany, beginning to understand the dangers of her weakness. Since breaking the London agreement in December 1921, Germany had paid almost nothing, apart from the proceeds of the under-subscribed loan of April 1923. The Reparations Commission established by the Treaty of Versailles finally met on 30 November 1923 and chose Charles G. Dawes, an American banker from the Midwest, to rethink the reparations at a realistic level. It is true that at the beginning of 1924 monetary stabilization caused a return of confidence and the beginnings of German economic renewal. However, Schacht's monetary stringency limited bank lending, since he insisted that any new lending should be preceded by repayment of existing loans. Bankruptcies ceased. Unemployment replaced inflation and Germany still did not have the means of meeting the payments set in London.

"On 8 February 1924, when Schacht saw Charles G. Dawes for the first time, he explained that he was willing to pay reasonable amounts, but on condition that he did not have to borrow abroad on a short-term basis in order to do this. He therefore wished to encourage foreign investment in Germany and urge German companies to borrow abroad to bring in foreign exchange, which would again improve the economic situation. In the spring of 1924 the Dawes commission, after

three months' work, recognized that it was in the interests of the Allies that the German economy should recover, even if this meant agreeing to postpone or reschedule the payment of reparations: this had been the view of Max Warburg and John Maynard Keynes ever since Versailles. It had taken nearly five years for the Allies to accept it. Five years too long.

"In April Dawes proposed the granting of an initial loan from America of 800 million gold marks at 8 per cent in exchange for Allied control over the railways and the Reichsbank. The indemnity was still set at 132 million gold marks, but with annuities increasing from 1 to 2.5 billion; Germany was to pay this off over five years.

"Also in April 1924 M. M. Warburg and the International Acceptance Bank in New York put together some loans to German companies in rediscounted dollars. Among these was rediscounted loan for first \$5 million and then \$25 million to the Golddiskontbank, whose board Max joined. In the same month Hugo Stinnes died, leaving a huge group ranging from banking to steel and from cement to paper.

"The same year, a few months apart, the other European currencies still floating in search of a theoretical return to pre-war parities were hit by the previous year's German inflation.

"In France, despite the exchange control introduced in 1918 and strengthened in 1924, the victory of a left-wing alliance set off speculation against the franc, especially from Hamburg: M. M. Warburg's role in this has not been established.

"The Lazard and Morgan banks then financed counter-speculation, and by throwing its full weight into the battle the French Government managed to stabilize the exchange rate of the franc. In May the Hamburg speculators suffered such heavy exchange losses that in order to save companies who had speculated, Max Warburg had to arrange a support fund of £110,000, subscribed by the city's leading banks. A little later, in 1926, a government of national unity brought the value of the dollar in France down from 40 to 25 francs.

"On 30 August 1924, as provided for in the Dawes plan, a new law simplified and unified the German banking system under Allied protection: the Rentenbank was abolished and the Reichsbank again became the sole issuing institution, completely independent of the Government, with a ruling council consisting of seven Germans and seven foreigners. Max Warburg was appointed a member at the request of Schacht, whose friend and adviser he was gradually becoming. The bank's capital was 300 million gold marks. The reichsmark once more became the national currency, backed by gold. In fact the notes in circulation were only 40 per cent covered by the bank's reserves, and one-quarter by foreign exchange. Parity was set at one reichsmark, or one trillion paper marks, to 0.3583 grams of gold.

"The Dawes plan was ratified on 1 September 1924 by a vote of the new Reichstag, elected in May. The Ruhr was then evacuated by the Belgians and the French, and Germany was to live for five years on loans from America, reaching \$250 million a year. These loans were arranged by Dillon Read and the International Acceptance Bank in New York, Sullivan & Crownwell, headed by J. F. Dulles in the United States, and Schroder in London. Half of the money would go through the big three German banks: Deutsche Bank, Commerzbank and the Darmstadter Bank, and the rest through three investment banks, among them M. M. Warburg, which made a big profit from this. The greater part of these loans went to Krupp and Stinnes, into steel and coal. In order to issue the loans in dollars, arrange the bank syndicate and place the securities, the German and American banks set up a network of high-quality experts in Berlin and Hamburg." (Attali, *A Man of Influence*, pp. 88-89.)

Birth of the Bank for International Settlements in Basle

"Europe was now dependent on America to make ends meet. However, the US was not yet conscious of its responsibilities and the old continent was to pay dearly. Very dearly. As Michel Aglietta writes:

"...the replacement of British loans by American loans in order to support the fragile banking systems of Central Europe and Latin America put the latter at the mercy of a speculative wave set off by the purely nationalist monetary policy of the United States, a phenomenon which came about from 1928 onwards.'

"As for Britain, she was still clinging to her absurdly fixed parity.

"At the end of 1928 the Allies thought that the time had come to reopen the question of reparations, which weighed very heavily on Germany from then on. From February to June 1929 another conference in Paris brought together France, Great Britain, Belgium, Germany, Italy, Japan and the United States – Hoover had just arrive in the White House – to attempt to give a final ruling on the matter. Owen D. Young, number one at General Electric, was appointed chairman. Schacht, determined to secure the result that Germany should cease paying these excessive installments, came to Paris on 11 February 1929 to lead the German delegation himself, without however giving up his duties in Berlin.

"In April, in the name of the Allies, Young asked Germany to pay amounts even higher than those provided for by the Dawes plan. He proposed the creation of a sort of world bank to manage the loans needed to finance the reparations. Schacht accepted the principle, but not the amount. In the end there was agreement on a reduction of the reparations to 38 billion gold marks, payable in thirty-six annual installments – instead of the 132 billion of the Dawes plan and the London agreement – and on a mechanism for issuing international loans to pay for the reparations, to be organized by a new semi-public, semi-private international institution, to be called the Bank for International Settlements.

"What Paul [Warburg] had tried to do with his International Acceptance Bank was therefore now being carried out on a large scale. The plan was initialled by Young and Schacht in the name of Chancellor Muller on 7 June 1929, despite the furious opposition of Adolf Hitler.

"On 3 October 1929, the day Stresemann died, Max [Warburg] noted: 'This is a hard loss for Germany and for all those in search of a new and better world.' On the same day a committee chaired by the American banker Jackson E. Reynolds worked out the final form of the BIS. Its capital was to be guaranteed by the central banks of Germany, Belgium, France, Great Britain, Italy, a group acting for the Bank of Japan and a group of three American banks (J. P. Morgan & Co., the First National Bank of New York and the First National Bank of Chicago). Other central banks would be able to subscribe within two years. The following month in Rome, governors of the banks of signatory countries signed the constituent instrument for the BIS, which established itself in Basel. This was officially adopted at The Hague conference in January 1930, and France undertook to evacuate the left bank of the Rhine before the end of June of that year. The international inspections of Germany and the reparations commission of the Treaty of Versailles were abolished. On 11 March 1930 the Young plan was adopted by the Reichstag at the end of a stormy debate. On 17 May the BIS began its work, in the midst of the Great Crash.

"Many people then began to see what Paul had been trying to establish for more than ten years: a world central bank. Thus a week after it came into being the spirit and outlook of the BIS were outlined at a lecture in Paris by Jacques Rueff, a young and unknown French inspector of finance, then Financial Attache in London. He summed up:

"The bank spares the governments concerned from having to guarantee their foreign payments themselves, and to this end keeping the various reserves in foreign currencies required by these payments – reserves which would duplicate those of the issuing banks, set up with exactly the same object in view.... This brings us to the concept of a real 'BIS currency', freely convertible into any currency at that currency's rate of exchange. Following this surmise – lightly, as one travels in the realm of dreams – one can well imagine a time when the basis of central bank lending will consist only of gold or the undefined BIS currency. A true international currency will then exist." (Attali, *A Man of Influence*, pp. 98-100.)

Paul Warburg Predicts the U.S. Depression

"There was also euphoria in New York. Paul [Warburg] was almost alone in expecting a crisis. He thought that world debt was too great, with companies borrowing ever more in order to meet annual payments on earlier debt. In New York share prices and speculation raced ahead, and Paul knew that when money

goes for the short term rather than the long, the economy is in danger. Everyone was trying to speculate on stocks and shares: more than one million Americans were playing the market. In February almost \$10 billion were in speculative positions. The demand for speculative capital was such that interest rates went up to 9 per cent, but despite this rate, \$500 million worth of stock was still placed each month. So as to get in on the issue market, the commercial banks then increased their investment agencies across the country.

"Paul realized that his own efforts had done no more than postpone the day of reckoning and that a time would soon come when the general indebtedness of the country, worsened by speculation, would have to be paid for: whether by the debtors or the creditors.

"At the beginning of 1929, in the last annual report of the International Acceptance Bank, shortly before it became the International Manhattan Co., Paul wrote:

"The rise in stock exchange prices, in the majority of cases, bears no relationship to the growth of the companies, their assets or prospects of profit and if this orgy of uncontrolled speculation is not slowed down the final collapse will affect not only the speculators, but will cause a depression affecting the whole of the country.'

"He had said it all. Paul then warned his friends to get out of the market and sell their shares. Some did, among them Max and Felix, in part. Most sneered.

"The volume of trading on Wall Street reached a high point on 3 September. That month Max relaunched Warburg & Co. in Amsterdam with a capital of 5 million florins, to represent the interests of M. M. Warburg and those of the International Manhattan Co. of New York. Paul was appointed managing director. On 24 October Wall Street began to falter. Bank intervention held up prices for five days, but on 29 October they could no longer hold and collapsed: 16,419,000 shares changed hands. In ten days the market lost in total \$30 billion in value.

"After that 1930 was a nightmare year for American banks. Stuart, Merrill Lynch and Blyth scarcely suffered; but Kuhn Loeb, Goldman Sachs, Kidder Peabody and Lee Higginson almost had to stop payments. In September, 305 American banks were in liquidation; in October, 522." (Attali, *A Man of Influence*, pp. 100-101.

U.S. Government Helps Finance World War II

"On 2 December British reserves were exhausted, and Winston Churchill in 'one of the most important letters he ever wrote' sent Roosevelt an appeal for help: 'We need ships, planes and arms,' he wrote, 'and the time is coming when we shall no longer be able to pay.' On 10 December Jimmy Warburg wrote in the *New York*

Tribune that if the law forbade America to lend to Britain, she should give her the amounts she needed, and he campaigned for a positive answer to be given to the British requests. On 17 December Roosevelt replied to Churchill that one 'cannot refuse to lend a firehose to a neighbor whose house is on fire', and prepared to authorize loans to Britain. He only insisted that before borrowing anew Great Britain should repay its previous loans and that she should mobilize all her financial resources. Morgenthau, who feared that Britain was hiding some of her reserves, insisted that the British should assemble all their gold at the Cape, where an American naval vessel would come to pick it up. The British agreed. On 10 January 1941, in the greatest secrecy, the *Louisville* took on board £42 million worth of gold which arrived in the United States on 26 January....

"On 11 March 1941 ... Roosevelt decided to make a real increase in aid to Britain and have Congress pass the Lend-Lease Act. The idea had first come to Jean Monnet, who with Siegmund Warburg was undoubtedly one of the greatest men of influence of this century. The innovation was that since it was not possible to lend, one should lease. While Britain had only survived the last eighteen months by selling her securities, she now received semi-loans and even gifts to buy arms and equipment in America. However, before Lend-Lease was put into operation, wide negotiations took place between London and Washington on its terms. Lord Keynes represented Britain. Congress effectively required that before the Lend-Lease Act came into operation, all British assets in the United States should be considered as collateral for the new loans and that all previous loans – i.e. \$700 million – should be repaid before the new plan was implemented. In May Morgenthau even suggested to Keynes that he should ask the American Government for a loan of \$400 million to pay off the earlier British loans. With a presentiment of probable refusal by Congress, Keynes suggested instead that this loan should be granted not by the American state but by the Reconstruction Finance Corporation (RFC) created before the New Deal, which would be more discreet. On 10 June, in order to make this operation possible, a bill increased the resources of the RFC and authorized it to lend to foreign governments, without specifying which ones. Thus it was able to lend without over-ostentation \$425 million for fifteen years to the British Treasury, on the security of British assets in the United States. The conditions of use of the goods received under this agreement were discussed later....

"On 7 December 1941 the attack on Pearl Harbor was not a surprise to everyone. In London the United States' entry into the war was welcomed with both relief and irony: they have been waiting for this for too long. In New York the investment bankers – Morgan, Kuhn Loeb, Dillon Read – swept aside from public business by the New Deal, came back in force to finance the war economy. The American Government awarded \$175 billion worth of military contracts and the military-industrial complex developed around the banks. The Reconstruction Finance Corporation financed Lend-Lease for the whole of the American economy and spent up to \$55 billion. Some people in America, rather sketchily no doubt,

identified eight financial groupings then in control of the major part of the American industrial economy engaged in the war: the Du Pont group (General Motors, Du Pont, US Rubber), the Mellon group (Gulf Oil, Westinghouse), the Morgan group (United States Steel, General Electric, Kennecott Copper, ATT), the Rockefeller group (Standard Oil, Chase National Bank), the Kuhn Loeb group (all public services) and the Boston group (United Fruit, First National Bank of Boston). Even if this is a simplified list, it is not too far from reality.

"At that time the attitude of American capital was not without ambivalence, and its links with Germany remained important: thus even in 1942 some Americans set up a syndicate of banks in Vichy with some French and German nationals to operate in occupied Europe under the name Societe de Credit Intercontinental. Among these were the Banque d'Indochine, the Banque Schneider, the Syndicat des Assureurs, the DeutscheKreditbank and the French subsidiaries of Ford and IBM. However, America quickly restored order and the association rapidly fell apart. (Attali, *A Man of Influence*, pp. 154-157.)

Post War Planning by the Elite

"From October 1941 talk began about the management of the post-war world and each American military concession was exchanged for a political concession from Britain, or in other words the rest of the world....

"The two leading monetary plans which were to clash over the next two and half years were drawn up at the very beginning of 1942. The authors were respectively Harry Dexter White, Assistant Secretary of the American Treasury, and John Maynard Keynes.

"White in his 'Program for inter-Allied monetary action' proposed the creation of two institutions, an inter-Allied fund intended to stabilize exchange rates, and an inter-Allied bank, aimed at assisting reconstruction and the development of international trade: the idea was to link this bank's granting of loans to the establishment of liberal trade and monetary policies. Nothing was said of the mechanism by which the exchange rates would be regulated, nor of the nature of the exchange standard, though it was implicitly admitted that this could only be the dollar, with or without theoretical reference to gold.

"Keynes proposed a very different and extremely centralized system. In his 'Proposals for an International Monetary Union', he wrote that the 'ideal system would surely consist in the establishment of a supranational bank which would have with the national central banks a relationship similar to that which exists between each central bank and the subordinate banks'. As far as he was concerned, 'this world central bank with a supra-national status, escaping the gold standard as well as the hegemony of one currency over the others, should have all the attributes of a central bank, with a supra-national currency for settlements between central banks. This bank for central banks, known as 'the Union' would manage accounts

denominated in 'Bancor', an international currency defined in relation to gold; the member countries would receive 'Bancors' in exchange for their gold; balances would be repaid. In cases where authorized drawings were exceeded, the member country would be able to adjust its exchange rates in agreement with the Union and would have to take the measures of adjustment it recommended.'

"So began an extensive theoretical debate. But it was already certain that the American plan, which ensured dollar control of the international institutions, would be the winner.

"On 23 February 1942, two months after the German rout before Moscow, the British and the Americans undertook in a Mutual Aid Act to encourage free trade, without explicitly mentioning 'imperial preference'. In April 1942 White unveiled a more specific plan 'in favour of a United National Stabilization Fund and a Bank for Reconstruction and Development of the associated countries'. For him the fundamental point lay in the limitation of America's obligation as a creditor, and in its right, along with other creditors, to a blocking majority on any important decision, particularly in the matter of loans. Constituted by subscription, the Stabilization Fund would have the power to buy the currency of this or that country. It would be in control of the exchange rates at which transactions would be carried out, and would be able to impose adjustment measures; an exchange rate should only be altered when this proved necessary to correct imbalances; only countries with credit balances in gold would be able to benefit from Fund loans. According to Keynes, this new version of the White plan, though better than the first, still did not allow enough adaptation liquidity to what was needed, and again gave too much power to the Americans.

"In May 1942 Great Britain had to sell off its shares in the American armaments industry in order to pay the latest installments on its earlier loans. (Attali, *A Man of Influence*, pp.157-159.)

U.S. Taxpayers Provide Funds to Rebuild Europe

"In 1947 he [Siegmond Warburg] met George Ball, then still a lawyer, one of the Americans most interested by European questions, who would become a close friend and one of his main channels of influence in Washington at the time of the Kennedys. Siegmund [Warburg] did his utmost to convince all sides to use American aid to build a united Europe. Then came the Marshall plan, named after a general who had just failed in his mission to conciliate between Chang Kai-shek and Mao Tse-tung, and who in January 1947 had become Truman's Secretary of State in place of Byrnes. On 5 June in a speech at Harvard he put forward a plan for European reconstruction which a year later would take over from bilateral aid.

"At that time, in May 1947, the IMF made its first drawing, of \$25 million, or 5 per cent of its quota for France. Two other drawings of the same amount were carried out in June and July for the same country. However, this was in vain: on 25

January 1948 the first devaluation condemned by the IMF – because it was connected with the establishment of a two-tier exchange market – was that of the franc.

"On 28 June 1948 President Truman signed the bill authorizing under the Marshall Plan \$4 billion in loans annually and \$2 billion in different forms of aid to sixteen countries, and the Organization for European Economic Co-operation (OECD), set up six months previously, was to be in charge of managing this American aid.

"At the same time, the Bank for International Settlements was resuming its function as an agent for the distribution of American loans in Europe. Its former president, McKittrick, became vice-president of Chase National Bank – now Chase Manhattan Bank – and an adviser to Averell Harriman, then in charge of economic co-operation in Europe. Gold plundered during the war, valued at 3,740 tons, was paid back and the BIS was retained. (Attali, *A Man of Influence*, p. 182.)

A Global Financial System

"International finance is the pivot around which the world economy twists and turns, and it affects politics and economics in every nation. Money and capital markets around the world are part of a global financial system in which all firms and investors compete continually with their counterparts in other countries. Every day hundreds of billions of dollars in stocks, bonds, and currencies speed electronically from trading room to trading room in search of a higher rate of return, so that Singapore and Paris, or London and Panama, are financially as close as midtown Manhattan and Wall Street. These enormous capital flows have blurred the lines between national financial markets, and have changed the environment within which investors, managers, workers, and politicians operate.

"The United States is not immune to the rigors of this global financial integration." (Jeffrey A. Frieden, *Banking On The World: The Politics of American International Finance*, New York: Harper & Row, 1987, p. 1.)

International Bankers Promote Global Financial Integration

"Global financial markets are the centerpiece of the contemporary world economic world order, which was built largely by the United States in the aftermath of World War II. America's international bankers, indeed, led the charge toward today's global economic integration. In the 1950s, after twenty-five years of depression, war, and reconstruction, a few large banks from New York, Boston, Chicago, and San Francisco began to expand their foreign operations. The cautious early moves toward international financial openness were not controversial; the growing global banking system was barely noticed, for the United States was fully able to lead and manage world economic interaction...." (Jeffrey A. Frieden, *Banking On The World*, p. 2.)

Wall Street Becomes Banker to the World

"The First World War and its aftermath pulled the United States into the world economy with a vengeance. Wall Street became banker to the world, and American corporations set up shop all over Europe and Latin America. Nonetheless, the size of the American market and the insularity of American politics tempered the enthusiasm of many Americans for international adventures. The American political system was torn between 'internationalists' who wanted the United States to tap its potential for world economic and political leadership, and 'isolationists' content to steer clear of European entanglements and rely on America's traditional sphere of influence. After a brief flurry of Wilsonian engagement, the country beat a partial retreat during the 1920s and stayed out of the international political arena as much as possible – even as American bankers came to dominate the world economy." (Jeffrey A. Frieden, *Banking On The World*, p. 11.)

American Financiers Guide the World Toward Economic Integration

"After World War II, American finance and industry, led the capitalist world toward economic integration." (Jeffrey A. Frieden, *Banking On The World*, P. 12.)

International Bankers Help Finance Wars

"American bankers were indeed of increasing international importance. The firm of Kuhn, Loeb and the National City Bank, in concert with British and German partners, lent \$410 million to Japan during the Russo-Japanese war of 1904-1905. Jacob Schiff – head of Kuhn, Loeb, America's leading ... investment bank – was especially pleased to be able to assist the Japanese war against the ... 'enemy of mankind' sitting in St. Petersburg. The British government itself borrowed some \$200 million from the firms of Morgan and Kidder, Peabody between 1900 and 1902 to help finance the expensive Boer War." (Jeffrey A. Frieden, *Banking On The World*, p. 24.)

American Bankers Finance World War I

"By the time the United States entered the war, [WWI] its private financiers had lent some \$2.6 billion to Britain, France, and their allies. Most of the lending was managed by [J. P.] Morgan, who also acted as the American purchasing agent for the Allies. Morgan's purchases on behalf of its Allied clients averaged over a billion dollars a year between 1914 and 1917, and accounted for one-quarter of American exports. We can get an idea of the magnitude involved by noting that the \$2.6 billion in lending between 1914 and 1917 was more than twice the federal government's debt at the time, while Morgan's purchases for the Allies were greater than 1910 federal government spending. More generally, since the U.S. economy today is about one hundred times as large as it was at the time of World War I, owing to both inflation and economic growth, we might multiply the figures

by 100 to get a sense of their present-day equivalents." (Jeffrey A. Frieden, *Banking On The World*, pp. 26-27.)

The U.S. Government Helps Finance World War I

"In March 1917, indeed, Morgan's firm told the British Treasury that private lending was no longer feasible. At much the same time, however, the Germans, in a serious miscalculation, resumed unlimited submarine warfare. The ensuing American declaration of war, on April 4, 1917, came just in time to save Allied finances. The U. S. government replaced the private bankers, issued five series of war bonds, and lent \$9.6 billion to the Allies between May 1917 and April 1919." (Jeffrey A. Frieden, *Banking On The World*, p. 28.)

International Bankers Become the Greatest Force in International Relations

"World War I put American international bankers at the center of world politics, and they faced the aftermath of World War I with great enthusiasm. In the years following the war, the financiers became unarguably the greatest economic force in international relations. Yet their ambitious plans for a postwar world congenial to their interests were continually waylaid by political opponents within the United States, who made it very difficult for the U.S. government to back up U.S. bankers overseas. As Woodrow Wilson discovered in his unsuccessful fight for the United States to join the League of Nations. It was far easier to have one's way with war-weary Europe than it was to win over the representatives of America's heartland in Washington.

"The nation's international financiers, though, saw clearly the course they wanted to follow. The time had come for America 'to seize and hold her rightful heritage – the material and moral leadership in world affairs,' in the words of New York financier A. J. Rosenthal. Otto Kahn of Kuhn, Loeb told his countrymen: 'Whether we like it or not we must take part in the economic affairs of Europe.' This meant supervising European reconstruction – and, if necessary, financing it." (Jeffrey A. Frieden, *Banking On The World*, pp. 29-30.)

International Bankers Draft Postwar Plans

"American bankers' participation in planning for the postwar settlement began as soon as the United States entered the war. Thomas Lamont, the prominent Morgan partner, sailed to Europe in the autumn of 1917 as a confidential financial advisor to the all-important mission of Colonel E. M. House to discuss wartime and postwar plans with the British and French. After the Armistice, Lamont once more set off for Europe. This time he was an official U.S. Treasury representative to the complex negotiations at the Paris Peace Conference. Lamont and fellow Wall Streeters Norman H. Davis, Bernard Baruch, and a young John Foster Dulles spent most of the first half of 1919 working on the crucial economic components of the Versailles treaty. The Americans were especially concerned to moderate the

Anglo-French demands that Germany pay exorbitant war reparations, in excess of \$100 billion; they eventually obtained an acceptable reparations agreement, although one still too punitive and imprecise for Lamont.

"After the Versailles negotiations were over, the bankers returned to the private sector, but continued their efforts at international crisis management. As Thomas Lamont later put it, Wall Street held Europe together in the 1920s: 'Bad as were the economic and financial conditions in Europe following World War I, nevertheless they were sufficiently within control to be handled largely by private banking and investment interests.'

"During the 1920s, United States private bankers initiated, supervised, and funded most of the central developments in the world economy. They built international organizations, stabilized currencies, and oversaw government economic programs in Europe and Latin America. Decision making in the 1920s international economy centered on Wall Street; the United States was a crucial component of the decisions taken; and the world operated in large part on a dollar standard.

"When, for example, the economies of Central and Eastern Europe nearly collapsed in the 1920s, stabilization programs were worked out, funded, and overseen by American and British bankers, generally joined by the Federal Reserve Bank of New York, the Bank of England, and the Financial Committee of the League of Nations. The combined influence of the major New York and London bankers, the world's leading central bankers, and the League of Nations was used to halt economic disintegration...." (Jeffrey A. Frieden, *Banking On The World*, pp. 30-31.)

International Bankers Build Network of Decision Makers and Opinion Molders in America

"America's international bankers after World War I also went about building a network of decision makers and opinion leaders inside the United States sympathetic to their internationalist views and capable of implementing them. The National City Bank helped American universities introduce foreign trade into their curricula. In 1914, New York University set up the nation's first course sequence on overseas commerce; within a year, seventeen universities had similar programs. The bankers also helped found professional schools for study of overseas conditions, such as Columbia University's School of International Affairs and Princeton's Woodrow Wilson School. They were instrumental in creating the think tanks and research institutions that have since been at the center of America's foreign policy establishment. The Foreign Policy Association, the League of Nations Association (now the United Nations Association), and the Carnegie Endowment for International Peace were all designed to develop a foreign policy, and foreign policy makers, worthy of America's new international role. The most

important of these institutions was the Council on Foreign Relations (CFR), formed right after the end of the war. Morgan's chief counsel was the CFR's first president, and Wall Street was overwhelmingly represented on its board. When the council began publishing the journal *Foreign Affairs* to serve as the center for foreign-policy debate, Morgan's Thomas Lamont arranged for the man who had edited Lamont's *New York Evening Post* to become the first editor of the journal.

"Some important sectors of the U.S. government shared the bankers' vision of world leadership. The State Department was a bastion of internationalism, and Charles Evans Hughes, secretary of state from 1921 to 1925, was extremely sympathetic. The new Federal Reserve System, dominated by Benjamin Strong, the powerful chairman of the Federal Reserve Bank of New York, was a reliable ally. 'We feel in New York,' Strong told his fellow Fed governors in 1921, 'that the general recovery of trade around the world is going to be brought about by our making New York a good market in which the world can borrow money.'" (Jeffrey A. Frieden, *Banking On The World*, pp. 33-34.)

The International Bankers Well Laid Plans Encounter Opposition From Nationalists

"The economic influence of American bankers was extraordinary in the 1920s, and yet the decade was one of repeated political failure and frustration for them. Ironically, the single biggest hurdle to their well-laid out plans turned out to be within the United States itself. After the internationalist interlude of the war, traditional nationalists quickly reasserted their powerful position in American politics.

"Despite the fundamental change in America's international economic position, within a couple of years following the end of World War I most of the bankers' international plans ran into serious opposition within the American political system, and with a few exceptions this opposition blocked their full implementation. This is especially striking since most of the bankers' program – trade liberalization, U.S. aid for European reconstruction, American international monetary and financial leadership – was implemented with little difficulty in the late 1940s. After World War I, however, domestic political opposition to 'internationalism,' as the new interest in American world leadership came to be called, was so powerful that the bankers and their allies faced round after round of grueling battles and partial defeats in the U.S. Congress and much of the cabinet.

"The first major failure of the 'internationalists' was the refusal of the U.S. Congress to approve American entry into the League of Nations.... Congress voted down virtually all legislation committing the country to the international organizations American bankers had worked so hard to design and implement.

"The bankers' second great failure was in their attempt to move the United States away from its traditional protectionism. Unless the United States bought

more from Europe, the Europeans would not have enough dollars to repay their debts. Otto Kahn told his country: 'Having become a creditor nation we have got now to fit ourselves into the role of a creditor nation. We shall have to make our minds to be more hospitable to imports.'

"The United States had some of the world's highest trade barriers before World War I, although Woodrow Wilson had brought tariffs down in 1913. The war so disrupted world trade, though, that the effects of these lower tariffs were barely felt. By 1920, a postwar depression had rekindled the debate, and the bankers fought long and hard to keep the American market open to their European clients.

"These bankers knew that reducing the American tariff meant giving up some of the domestic market to foreigners, but they saw this as a small price to pay to gain access to foreign markets for American goods and capital....

"The bankers' third major failure was over what soon became known as the 'war debts-reparations tangle.' By the end of World War I, America's allies were saddled with some \$10 billion in war debts to the U.S. government, which they attempted to counterbalance by extracting reparations from a defeated Germany. The European victors complained endlessly about the burden of their payments to the United States, while Germany deeply resented the ignominy of its reparations payments to the victors. With Europe's economic and political relations hamstrung by war debts and reparations, Europe's capacity to borrow from American bankers and buy from American exporters was seriously limited.

"Jack Morgan was blunt. 'Those debts should be cancelled,' he told the *New York Times* in 1922. The bankers lobbied tirelessly for the United States to write off all or part of Europe's war debts to the U.S. government, which would allow the British and French to scale down their demands for German reparations; the European economies would be sounder, and American lending to Europe would be able to resume. Kuhn, Loeb's Paul Warburg told President Harding in 1921, 'It is of infinitely greater value to the United States to reconstruct a world in which we can trade in peace and security than to have on our books obligations of our comrades in arms which they cannot pay.'

"Yet inside the United States, opposition to canceling Europe's debts to the U.S. government was overwhelming. There was, of course, the 'moral' issue: 'They hired the money,' as Calvin Coolidge said. A more practical objection was that interest on the government's loans to Europe was expected to be about one-seventh of all U.S. government revenue, and a cut in these interest earnings would require a domestic tax increase, which the heartland's industrialists believed would prolong the postwar recession....

"Herbert Hoover, Commerce secretary in the post-Wilson administrations and the principle economic policymaker in the cabinet, was himself suspicious of the bankers. Hoover was primarily concerned with American industry, not finance. He

wanted American exports to grow, and he wanted the country's industries to have access to the cheap raw materials he had worked to find as a mining engineer abroad. Yet loaning money to the overseas competitors of American business was far less desirable. 'A billion dollars spend upon American railways,' Hoover insisted, 'will give more employment to our people, more advance to our industry, more assistance to our farmers, than twice that sum expended outside the frontiers of the United States.' (Jeffry A. Frieden, *Banking On The World*, pp. 34-35, 36, 37-38, 39.)

New York Federal Reserve and State Department Officials Cooperated in Secret With Private International Bankers

"The result of the international bankers' economic expansion and their frequent political defeat within the United States was a curious patchwork of private involvement in, and public disengagement from, European economic affairs. While Wall Street became more and more committed to the international economy, the U.S. government drew back from Wilsonian internationalism. No American officials participated in international organizations, and American government involvement in European economic affairs was minimal. To be sure, the New York Fed and the State Department cooperated with the bankers, usually in secret; but the executive branch for the most part simply observed while private American bankers tried to reshape the world economy." (Jeffry A. Frieden, *Banking On The World*, p. 39.)

International Bankers Develop Postwar Plans After World War II

"Wall Street built a cohesive network of wealth, power, influence, and intellect in the years after 1914. Individual bankers and their allies accumulated a storehouse of contacts and experience that proved essential during and after World War II. John Foster Dulles, to take one prominent example, cut his teeth on international affairs as a Wall Street lawyer in the 1920s. Among other things, he helped supervise the Polish financial stabilization of 1927 as counsel to the American banks involved (Chase; Blair and Co.; and Bankers Trust). Along with learning about European politics and finances, the experience brought him together with Jean Monnet, Chase's Paris representative, who built the European Common Market during Dulles' reign as U. S. secretary of state in the 1950s.

"An entire generation of American foreign-policy makers and shakers, many of them bankers, lawyers for bankers, and financial journalists, formed its view of the world in the turbulence of Versailles, the boom of the 1920s, and the disasters of the 1930s. Much of the powerful cohort of wartime and postwar leaders who would rebuild the world after 1945 came from Wall Street. Dean Acheson, John Foster Dulles, James Forrestal, W. Averell Harriman, Robert Lovett, John McCloy, and Edward Stettinius were all major Wall Street figures who molded American

foreign policy after World War II, fired by a determination not to repeat the mistakes of the 1920s." (Jeffrey A. Frieden, *Banking On The World*, p. 49.)

International Bankers Develop the Most Powerful Financial System in World History

"The international banking business was slow, but American international bankers were anything but inactive. They were powerful people with strong ideas about the proper path for the country to take. In the 1930s and 1940s, American international financiers redoubled their efforts to lead the United States toward a course of action they deemed appropriate. The successive waves of economic, political, and eventually military cataclysms that swept the world after 1930 clearly made it impossible to return to the pattern of the 1920s, in which American international bankers had tried to rebuild the world economy with the committed support of the U.S. government. As Thomas Lamont wrote in 1947, what he and his colleagues in private banking had done in the 1920s, 'today can be undertaken only through the cooperation of governments themselves,' for 'the chaos in Europe is so complete that only strong government action can hope to reduce it to some degree of order.'

"The bankers were able to get much of what they wanted in postwar international reconstruction, for domestic resistance to American international economic and political involvement diminished in the 1940s. Foreign competitors were few and far between at the end of World War II. Even so, there was quite a residue of domestic hostility to internationalism. Perhaps most important in overcoming this hostility was the connection made within a few years of the war's end between economic internationalism and the broader American program of building a Western anti-Soviet alliance. On this basis, despite lingering popular uneasiness about overseas commitments, America's international bankers were able to play a central part in building the new international economic order.

"The Depression and World War II indeed led the U.S. government to embrace many of the bankers' ideas, and many of the bankers themselves, in the process of planning a postwar world. After the war, the government took on the task of remaking the international economy, with the enthusiastic participation of the bankers in this second chance at postwar reconstruction. On the basis of the new economic order that ensued, America's international banks rebuilt their shattered networks abroad and led the way toward the largest and most powerful international financial system in world history." (Jeffrey A. Frieden, *Banking On The World*, pp. 51-52.)

Wall Street Financiers and Lawyers Design the Postwar World After World War II

"As war began in Europe, Wall Street's economic internationalists flooded into the administration to plan for the postwar economic settlement. Some of the

country's most prominent wartime and postwar figures came to government from the financial community. W. Averell Harriman – son of financier and railroad man E. H. Harriman and senior partner in the firm of Brown Brothers, Harriman – was perhaps America's best-known international envoy from 1941 to 1953. Harriman served successively as coordinator of Lend Lease assistance to Britain, ambassador to the Soviet Union, ambassador to Great Britain, secretary of commerce, American overseer of the Marshall Plan, chief foreign affairs advisor to the president, and director of mutual security. Robert Lovett was a long-time associate of Harriman's, both in railroads and at the firm of Brown Brothers, Harriman; he started as assistant secretary of war for air, then became under secretary of state to George Marshall, then Marshall's deputy secretary of defense, and finally secretary of defense in his own right. James Forrestal, a close friend of Lovett's left the presidency of the investment bank of Dillon, Read to serve as under secretary of the navy, then secretary of the navy, then secretary of defense until mental illness drove him from office and to suicide.

"A number of Wall Street lawyers also served prominently. Dean Acheson came back to the administration in 1941, and progressed from assistant secretary to under secretary to secretary of state. John Foster Dulles, a Republican, was an important advisor to the Democratic administrations and then succeeded Acheson as secretary of state when Eisenhower took office. John McCloy was assistant secretary of war, then president of the World Bank, then American high commissioner in Germany. These veterans of the American financial establishment, and others less well known, spent most of their time and energy between 1939 and 1955 in or around the government, helping to design the postwar world.

"The internationalists, both those who went to Washington and those who remained in the private sector, wanted a reconstructed world to be based on free trade, sound currencies, and international economic cooperation under American leadership. The United States would have to discard once and for all the foreign-policy ambivalence international bankers had confronted in the frustrating 1920s." (Jeffrey A. Frieden, *Banking On The World*, pp. 57-58)

International Bankers Oppose Efforts for European Nations to Become Self Sufficient

"To American postwar policymakers, the incessant attempts of Europe's small nations at economic self-sufficiency on a national basis seemed both absurd and inherently warlike. The best way to avoid another Continental war was to tie the Western European economies together in a web of economic interdependence." (Jeffrey A. Frieden, *Banking On The World*, p. 71.)

International Bankers Control the Euromarket

"Today's international financial markets constitute a pool of capital of almost unimaginable size. The offshore markets in which most international banking takes place hold almost \$3 trillion. If one subtracts transactions among banks themselves, the market's net size is well over a trillion dollars. Even the lower figure is staggering: it is equal to the entire output of China's 1 billion people in four years. The market's trillion dollars could buy every manufacturing corporation in the United States, as well as the livestock, crops, buildings, and machinery on all of America's farms.

"This huge pool of capital is not stagnant. In an average year, banks and other investors in the offshore markets lend \$300 billion to governments and nonfinancial corporations. Since the early 1970s, about half the borrowers have been from North America, western Europe and Japan; a third from the non-OPEC developing countries; and the rest are from the non-OPEC developing countries; and the rest are about evenly split between OPEC and Communist borrowers. The approximately \$300 billion that international financial markets lend out every year is roughly equal to what America's corporations borrow in three normal years, or what they invest in a normal year. In other words, every year international banks lend enough to purchase every new factory, railroad, port, ship, power plant, and other productive facility built in America in that year, along with all the new machinery inside them; or to buy all of the new private homes and apartment houses built in the United States during three average years.

"Banks all over the world are tied electronically to these enormous international financial markets. They can shift millions of dollars around the globe, or trade billions of yen for Deutsche marks, in a matter of minutes. They can put together billion dollar loans for major governmental and multinational corporations in a few days. Their ability to respond instantaneously to economic and political events has transformed the world economy." (Jeffrey A. Frieden. *Banking On The World*, pp. 79-80.)

Leading Banks Determine the Contours of the American Financial Market

"Today the Euromarkets tie the world's investors, borrowers, and banks together in a network that is at the same time part of no national financial system and part of them all....

"Eurobankers deal primarily with other Eurobankers; over half of all offshore business is between banks. Most of the rest is with major multinational corporations, big institutional investors, and governments. This is a market for the 'heavy hitters' seeking to borrow, trade currencies, and make deposits in multiples of a million dollars. Loans in the billions are not rare.

"The offshore markets are indeed attractive to large depositors and borrowers. The relative insulation of these markets from the whims of national authorities makes them appealing to governments that might be subject to financial intervention for political purposes, as well as to large private investors interested in evading taxes. The fact that banks doing business on the offshore markets are generally free from national financial regulations, and that international banks deal only with very large deposits or loans, allows the offshore markets to pay more to depositors, charge less to borrowers, and use the latest in telecommunications technology and financial innovations. The combination of state-of-the-art technology and relative freedom from government interference makes the offshore markets the financial marketplace of choice for the world's leading banks and corporations.

"This great international financial system is important, both for its size and because it forms the apex of a pyramid whose base is the national economies of the entire capitalist world. The huge financial institutions that dominate the offshore markets in turn hold sway over the financial markets of their home nation. The United States is a good example. Nine American commercial banks – Citibank, Chase, Morgan Guaranty, Manufacturers Hanover, Bankers Trust, and Chemical, all of New York; and First Chicago – account for the vast majority of American international financial activities. They are joined abroad by five leading investment banks – First Boston, Morgan Stanley, Salomon Brothers, Merrill Lynch, and Goldman Sachs. These few internationally prominent banks from the United States largely determine the contours and direction of the entire American financial market. The five investment banks do two-thirds of all bond underwriting in the United States. The leading commercial banks have about one-third of the resources of the entire American banking system among them, and each of them is several hundred times the size of the average American bank. When Chase or Citibank lowers or raises its prime lending rate, other banks follow suit.

"Around the world, the largest banks from every major non-communist nation have become international, and with several dozen counterparts from other countries, they lead the international banking system. All nations are drawn into the international financial whirlwind: Their economies depend on their domestic financial system, the financial system are led by a few big banks, and these few banks are part of the tightly knit world of international finance.

"The offshore financial markets contain more capital than has ever been brought together in all of world history, and they are a major force in the economies of all of the world's nations. No corporation, investor, or government is insulated from trends in international banking. Investment, production, and commerce all rely on the banks; international currency movements, international trade, and international investment flow through the banks; governments plan and execute their policies with a close eye on the international financial reaction." (Jeffrey A. Frieden, *Banking On The World*, pp. 90, 91-92.)

International Bankers Possess Veto Power Over National Governments

"The ability of the contemporary international financial system to shift billions of dollars from place to place in minutes gives the markets something akin to veto power over domestic or international decisions. All the world's companies and governments are interested in having access to funds as cheaply as possible. The great integration of contemporary financial markets means that this battle for finance is global; companies and governments compete against each other for the confidence of the international financial system. Actions that reduce confidence will raise the cost of capital to firms or countries, so they must be concerned with maintaining the markets' goodwill.

"For international bankers, the markets' ability to restrain the behavior of politicians is a profoundly good thing. International finance thrives in large part because national governments do not interfere with it. More generally, the international financial system depends so entirely on the free movement of capital across border that any attempt to restrict these movements is a threat to the markets as they are currently organized. The international financial community, has a vested interest in convincing the world's governments, and their people, that intervention in their business will be counterproductive, and may even be impossible." (Jeffrey A. Frieden, *Banking On The World*, p. 113.)

International Bankers Rule Over the Nation-States

"Walter Wriston is the most prominent spokesman for the American international banking community, and there is little doubt that his conscience coincides with his needs. In the decade up to 1984, Wriston was one of the world's leading bankers as chairman and chief executive officer of Citibank. He helped engineer Citibank's extraordinary international expansion in the 1970s, and even in retirement he is a participant in efforts to keep world markets open....

"Wriston believes that the battle between markets and politics is nearly over, and that politicians have already lost to what he calls 'the information standard' – the ability of firms and individuals to communicate globally and instantaneously. Wriston spoke to me in his Citicorp Office:

"The gold standard, replaced by the gold exchange standard, which was replaced by the Bretton Woods arrangements, has now been replaced by the information standard. Unlike the other standards, the information standard is in place, operating, will never go away, and has substantially changed the world. What it means, very simply, is that bad monetary and fiscal policies anywhere in the world are reflected within minutes on the Reuters screens in the trading rooms of the world.

"Money only goes where it's wanted, and only stays where it's well treated, and once you tie the world together with telecommunications and information, the ball

game is over. It's a new world, and the fact is, the information standard is more draconian than any gold standard. They think the gold standard was tough. All you had to do on the gold standard was renounce it; we proved that. You cannot renounce the information standard, and it is exerting a discipline on the countries of the world, which they all hate. For the first time in history, the politicians can't stop it. It's beyond the political control of the world, and that's the good news.'

"The size and speed of today's international financial transactions, Wriston says, makes it impossible for politicians to override the market's judgment.

"There not enough money in the world to support a currency with dumb fiscal and monetary management. The president of the United States goes out in the Rose Garden and says something dumb. The trading lights of the world light up, and it's all over. In France, Mitterrand announced all those ridiculous moves, and they lost a third of their foreign exchange in a week.

"There are 60,000-odd terminals out there in the trading rooms of the world, and those guys are about as sentimental as a block of ice. If they're going to sell, that's it. This is new in the history of the world, and I don't think it can be structured or contained, and I think that's good news over a longer frame. There's no place to hide.'

"Wriston realizes that market signals can be uncomfortable for political leaders or systems.

"The last thing the political process wants is to be accountable. But there's nothing the politicians can do. The information standard, the information-intensive society, moves accountability from a few knowledgeable men and women to the population. Internationally, it moves it to a judgment of the way your policies look to the international markets.

"At the end of the day, it's a new world and the concept of sovereignty is going to change. Politically, the new world is an integrated market in which nobody can get away with what they used to. You can't control what your people hear, you can't control your capital flows. The idea of fifteenth-century international law is gone. It hasn't laid down yet, but it's dead. It's like the three-mile limit in a world of Inter-Continental Ballistic Missiles.'" (Jeffrey A. Frieden, *Banking On The World*, pp. 114-115.)

Third World Countries in Financial Bondage to the International Bankers

"Developing countries in Latin America, Africa, and Asia owe over \$600 billion to international banks. Since 1982, debtor after debtor has gone to the brink of default, and the Third World debt crisis has been the most prominent and controversial issue in international finance." (Jeffrey A. Frieden, *Banking On The World*, p. 123.)

National Governments Are Powerless in the Face of International Bankers

"The world economy is entering uncharted waters. For hundred of years, economic and political systems have been primarily national and coterminous; business people and workers have taken their economic grievances to national governments. No government responds for the actions of international financial markets, and national policies are increasingly powerless in the face of a truly global banking system. Nonetheless, while capital may be extraordinarily mobile, most people – and most businesses – cannot move from activity to activity, or from place to place, in response to marginal economic changes.

"In every country with well-developed international economic relations, the dictates of global markets are in increasing conflict with the demands of firms, industries, and groups at the national level. International bankers, and many other economic actors around the world, have a vital interest in maintaining and deepening international financial and economic integration. Yet global markets threaten the livelihood of more insular business people and workers, who want to stop or even reverse international economic interdependence.

"In the United States, as in the rest of the world, the country's international financial relations are deeply entangled in domestic politics. The United States is increasingly subject to developments on international capital and goods markets. For some, this financial openness is the source of enormous profit opportunities, and they do what is possible to reinforce and protect contemporary international financial integration. For others, the country's exposure to international competition is a disaster, and they fight to restrict economic integration. The resultant battles can pit industry against industry, region against region, workers against management, and eventually, perhaps, country against country.

"The future of the international political economy, and of international finance, depends on how conflicting interests concerning the new economic realities are fought out in the political systems of the world's nations. The international political economy might move even further toward economic and political integration, an outcome which could subject nations and peoples to the ever-increasing, and often unpleasant, discipline of international market forces. The world might divide into more self-contained and protected investment and trading alliances, which might undermine existing international political relations. Or international economic relations might stumble from problem to problem, raising the specter of uncertainty and even collapse.

"The starting point for whatever direction the international political economy takes is today's highly integrated Western world economy. Robert Slighton, Chase Manhattan Bank's chief international economic forecaster, points out that strong and deep financial and trading ties bring together every capitalist nation: "The single broad trend of the postwar period has been increased economic

interdependence. The proportion of world trade to world output has increased dramatically. Even more dramatic has been the increased interdependence of world capital markets, to the point where it is almost a misnomer to talk about a national capital market. There is a global capital market, period. The United States is just a part, although a very major part, of the global financial market." (Jeffrey A. Frieden, *Banking On The World*, pp. 162-163.)

International Bankers Have a Powerful Interest in a Financially Integrated World Economy

"Since World War II, the economic and political leaders of all Western nations have been generally committed to international economic integration....

"Political consent made the global financial integration of the past thirty years possible, and political consent will be needed for this integration to advance. The most concerted political support for a continuation of current trends comes from the international business community. This includes both global banks and multinational industrial corporations with truly international production, distribution, and technological networks. International financial leaders and their allies around the world have battled to maintain international economic openness against the more insular pull of national politics.

"International bankers have powerful and concentrated interests in a financially integrated world economy, since their business is central to such a world. The more international trade and investment increase without government interference, the more scope there is for private international financial institutions to extend trade credits, exchange currencies, take deposits, and make loans. The material interests and ideological tenets of the world's bankers lead them to insist that policymakers heed, not controvert, even untoward international market trends.

"If economic internationalists prevail politically, and the postwar trend toward greater international economic integration is simply projected forward in a straight line, the result will be a capitalist world with truly global financial and goods markets and general political acceptance of market judgments. Walter Wriston believes that a fully integrated world economy immune from political interference is on the near horizon. 'Today,' Wriston has said, 'except in a very few instances, national borders are no longer defensible against the invasion of knowledge, ideas, or financial data.... We now have a new calculus, which, I believe, will in the end be beneficial to the world. It exerts global pressure on all governments to pursue sounder economic policies because it is becoming increasingly obvious that it is now impossible to hide in our new electronic world.'

"Should the political influence of such market globalists as Walter Wriston be as strong as their preferences, the capitalist world will move toward economic integration free from political interference. In such a world, firms and individuals, labor unions, and politicians would all accept the verdict of international markets

on the most efficient use of their time and energy. The economic role of government would be restricted to smoothing the transition of workers and capitalists from uncompetitive to competitive industries or regions, helping to organize markets, and providing a sympathetic judicial and social environment for private international transactions.

"The organization of the world's businesses on a global basis will, in this view, allow the market to decide how resources can most effectively and profitably be mobilized. International banks and corporations are the leading edge of the new order, says Wriston: 'The reality of the global marketplace has been the driving force pushing us along the path of developing a rational world economy. Progress that has been made owes almost nothing to political imagination. It has been the managers of the multinational corporations who have seen the world whole and moved to supply mankind's needs as efficiently as politics would allow'

"The attraction of market globalism is that it subjects all economic decisions to the scrutiny of international investors who can weigh potential profit opportunities around the world and encourage those that make the most economic sense. The argument is vaguely Social Darwinian: because economically impractical enterprises cannot survive in the long run, it is better that they never be started in the first place, or if they exist, that they be closed as quickly as possible. Globally integrated markets would not allow firms, workers, and governments to make costly mistakes – investing in unprofitable industries, acquiring unnecessary skills, adopting misguided policies....

"Nevertheless, stubborn domestic groups and political leaders can erect important obstacles between national and international markets. They can impose trade barriers on imported goods or grant subsidies to exporters.... (Jeffrey A. Frieden, *Banking On The World*, pp. 165, 166-168.)

Economic Interdependence Has Made National Sovereignty an Illusion

"Walter Wriston says impatiently, 'As a general rule, the politicians have been engaged in fragmenting the world, while the multinational corporations have been viewing the planet as a single marketplace.' Wriston's dismay is echoed by policymakers restless about the recalcitrance of national governments to respond to this changing international reality. Anthony Solomon, then president of the Federal Reserve Bank of New York and second only to Paul Volcker among the U.S. government's financial decision makers, worried in 1982 that 'the pronounced increase in interdependence we have seen has so far done little to dislodge deeply ingrained opinions. Instead, most governments, whether in the industrial countries or in the developing world, still cling to unrealistic notions of national autonomy.... It is an illusion that full national freedom of action exists in the kind of world we have, and it is wiser to be honest about that and let go of the illusion.'

"Given the formidable obstacles to global economic integration, even the most fervent believers in the desirability and inevitability of the process recognize that it will hardly be smooth. What they hope and expect is that the trend is in the direction they desire. Walter Wriston told me, '... We're in a revolution right now, and its being driven by technology. There is nothing the politicians can do – they can play King Canute for a minute, but the political process eventually catches up with technological innovation. That doesn't mean the halcyon days are here, or the wonders of world government, but I would argue that it's putting a closer noose in a shorter time frame on the political action of every country.'

"Increasing economic interdependence, Wriston believes, already so restricts the maneuvering room for national politics that it cannot be reversed. The economic attractiveness of every major nation, sector, and firm is being evaluated continually by thousands of bankers, traders, and investors around the world. Since government decisions affect profit opportunities, international currency markets pay close attention to political trends, and new policies are almost immediately reflected in currency values and capital flows.

"The sheer size and speed of global financial markets makes them an economic force in their own right. As Wriston puts it, 'The fact is that the foreign exchange market now amounts to around fifty trillion dollars a year and is just too big for any one entity to move. If you took all the capital of all the banks in the United States and sold it in the foreign exchange market, it would amount to about ten minutes of trading...'

"Many international bankers thus believe that the ability of international financial markets to move funds toward congenial political systems and away from hostile ones will eventually bring reality closer to their ideal world in which governments are unable to control them. As Walter Wriston said to me, 'the political process has to be altered; the marketplace will work in politics as it does in economics.' He anticipated that politicians unable to attract capital to their jurisdictions will be turned out of office as their economies stagnate, and will eventually be replaced by leaders who can instill confidence in international investors." (Jeffrey A. Frieden, *Banking On The World*, pp. 168-170.)

Tens of Millions of U.S. Jobs Will Become Extinct in the Future Interdependent World

"In an ideal interdependent world, the capital-rich and highly educated nations of North America and Western Europe would produce only goods that are intensive in capital and knowledge, concentrated in such sectors as high technology; labor-intensive manufacturing would be carried out in the labor-rich areas of the Third World. This may be rational and efficient, but it implies the extinction of tens of millions of jobs in the United States alone, and current jobholders cannot be sure that they would find employment in new lines of

business. Politicians from America's industrial centers can hardly relish the prospect of the gradual demise of the industrial workers and industrialists they represent. True international economic integration radically reduces the room for independent action by governments to protect their constituents' jobs and living standards.

"For a large number of groups and industries, the rest of the world is an economic threat rather than an opportunity...

"The impact of international financial affairs on domestic economies and politics is often unwelcome. Firms, groups, and politicians in industrial societies have thus tried to restrict the scope of international economic forces. Pressure for trade protection has mounted steadily in the United States since 1970, reaching its highest level during the early 1980s. Many European firms have turned away from volatile international markets toward more predictable bilateral contracts with customers in Eastern Europe and the Soviet Union; Western European politicians of all political views aggressively promote Eastern bloc trade. Traditional European industries have been vociferous in their demands for national, or Common Market, support against foreign competition." (Jeffrey A. Frieden, *Banking On The World*, pp. 170-172.)

National Sovereignty Threatens the Power of the Multinational Corporation

"In 1975, Henry Kaufman, a senior partner of the important investment bank Salomon Brothers and one of Wall Street's most respected leaders, expressed concern about the political difficulties facing international business leaders. 'Nationalism is on the rise again,' Kaufman wrote. The implications were serious. 'Unless we can arrest the rise of extreme nationalism, the multinational corporation will no longer be a growing force in international markets. Accelerating nationalism will mean increasing conflict between the economic rationality of the multinational corporation and the objectives of the sovereign state.'

"At the same time, Paul Volcker expressed similar fears to an interviewer from *Euromoney*... 'My experience in recent years has made me very conscious of the difficulty of getting a cohesive co-ordinated policy when there is this much dispersal of basic power centers and a kind of self-consciousness of separate political and economic identities that goes with the dispersal. It increases the danger in my mind that one country or another, running into economic adversity, is going to adopt fairly self-serving policies....' (Jeffrey A. Frieden, *Banking On The World*, pp. 174-175.)

The World's Leading Private Bankers Pressure Congress to Give \$8.4 Billion in U.S. Taxpayers Money to the IMF

"An important demonstration of how domestic economic distress in the United States might affect the international financial system came at the height of the debt

crisis. In 1983, the Reagan administration asked the U.S. Congress to approve an \$8.4 billion increase in the U.S. contributions to the International Monetary Fund. The international financial community regarded strengthening the IMF as essential, while many domestic political forces in the United States opposed the use of taxpayers' money to strengthen a system they did not support.

"The battle over the U.S. quota increase became the most hotly contested and closely fought struggle over American foreign economic policy since the 1940s. It pitted the world's leading private bankers and business people, and the combined weight of the Reagan administration, against domestic American political forces with little sympathy for international financial integration. The extraordinary difficulty the IMF's supporters had in the United States is an indication of how hard it may be to reconcile national politics with the needs of global capital markets.

"The International Monetary Fund plays a central role in international finance.... The debt crisis that began in 1982 gave this international financial police officer more to do than ever before. By 1983, dozens of countries – compared to one or two in the normal year – were in different stages of IMF programs designed to enforce good financial behavior. The fund had made so many stabilization loans that it was in danger of running out of cash. The IMF's available funds had to be increased; since these funds are met by quotas from member nations, each member had to increase its contributions. Agreement was eventually reached on an approximately 50 percent increase....

"In the United States, opposition to an \$8.4 billion additional American contribution to the IMF arose almost immediately. The international financial community looked on aghast at the possibility that provincial Congressmen might bring international financial markets to a standstill. Jacques de Larosiere, managing director of the IMF, voiced widespread fears that failure to increase the fund's resources 'would cripple this institution' and have 'incalculable consequences for economic and financial stability worldwide.'

"The Banker's Association for Foreign Trade (BAFT) coordinated and led much of the bank lobbying for passage of the IMF bill. This sixty-five-old lobbying group describes itself as 'the leading spokesman for the international banking community.' The Washington-based organization, with about 135 American banks as full members and another hundred foreign banks as nonvoting members, is a concentrated and specialized political organ of the American international banks.

"Washington lawyer Gary Welsh was centrally involved in the IMF quota conflict; he worked for BAFT during the legislative struggle. Welsh knows well both the principle obstacles to financial internationalization and the reasons for the bill's eventual passage. 'There's a strong political resistance to the internationalization of our economy,' he told me two years after the quota debate....

"The strange political lineup drew the labor movement, the New Right, and import-competing industrialists together as critics of the banks and the IMF....

"Most of the protestors were primarily interested in using the debate as a symbolic opportunity to raise long-standing concerns over U.S. government support for international banking; few had strong feelings about the quota increase itself. Even so, as Gary Welsh recalls, 'the bill was only approved because St. Germain (Jake Garn, a Utah senator and chairman of the Senate Banking Committee, and Fernand St. Germain, a Rhode Island congressman and head of the House counter-part) combined the IMF bill, which probably would not have passed the House on its own, with a whole series of bills on housing, community development, and a half dozen other things.'

"With few public supporters in their battle for the bill, the bankers had to rely on a behind-the-scenes network in the executive and legislative branches. 'In the international area,' Welsh says, 'a very small club carries the stuff through Congress, and you've got to be in good communications, working together.' Welsh lists the principal supporters activated during the debate. 'The Fed, obviously, was crucial. Volcker saw the implications of everything much sooner than the Treasury did. We worked very closely with the Fed, particularly in responding to initiatives that came out of the Congress about regulating the banks. We would need to come back, particularly through Volcker, and say they were a bad idea. Sometimes you don't want the banks to say it; you want the regulators to say it. There are ways to make your views known, and generally we'd talk to the Treasury, to the Fed, to the Comptroller (the Office of the Comptroller of the Currency, a Treasury agency that regulates many banks) and tell them the problems we saw. Then they would get up and testify, and say they had problems with this or that. So we had a very close working relationship with those three agencies.'

"... In their attempt to rally support for the IMF quota increase, bankers tied the bill in with everything from international economic stability to the dire consequences for American national security if Latin American debtors staggered from financial crisis to revolution. James Robinson III, chairman of American Express – one of the country's major international financial powerhouses, even though it is not a bank – drew graphic connections between financial leadership and unrest south of the border. 'It's been labeled a bank bailout bill,' Robinson complained to a *Fortune* reporter...

"Despite the best efforts of the bankers' allies in the executive branch, by the time the bill reached Congress it was already so politicized that chances for its approval were considered slim. Only backroom deals and the assistance of Fernand St. Germain allowed the banks and their supporters to guide the bill through the House, where anti-bank sentiment was concentrated. Early on, the Administration and the bankers convinced St. Germain to support the bill, but he insisted that he

needed to take a public position hostile to the financial community in order to maintain his political reputation and defuse opposition.

"Welsh describes the process by which St. Germain shepherded the quota increase through the House in private, while attacking international financiers in public: 'In the House Banking Committee there was a delicate balancing act. St. Germain said, 'Okay, I understand what's at stake here, but I know the House. I know that were only going to sell it to the members of the House if we can convince them that we're beating you guys on the head.' We were totally dependent on him to get it through the House, because he was the chairman of the committee. And because he is such a vocal critic of the banks, a lot of people believe him. So St. Germain played a critical role in dealing with the popular political sentiment for punishing the banks; he had to convince people that it was being done.'

"Indeed, St. Germain was a major bank critic during the debate. He opened one day of his committee's hearings on the bill, for example with reference to 'the deep concern that the international situation is, indeed, fragile and that the United States must ignore all else and ride quickly to the rescue. U. S. banks, trapped in their international adventures, have used this genuine concern to direct attention from their failings.

"U.S. banks have ignored prudent practices and domestic needs,' St. Germain continued, 'in search of the quick buck and sky-high interest rates offered by desperate borrowers caught in an international financial squeeze.... It ill behoves the Congress, the administration, financial regulators, or journalists to paper over banking excesses with flag-waving statements about the glories of financial colonialism.'

"Even while he engaged in some politically prudent bank-bashing, St. Germain assured the bankers that the bill would go through. He also promised that a variety of restrictive amendments approved in the House version would be jettisoned in the joint House-Senate conference committee. As Welsh recalls, 'The bills that came out of the House were terrible from an international banking standpoint. To get the IMF thing through St. Germain had to say, 'Banks won't be able to do this, they won't be able to do that; we're going to make them put up big reserves on all international loans.' It was a conscious strategy on his part to get it through the House. He'd tell us, 'Once we get in conference, I'll throw out all this stuff.'" The objectionable restrictions on international banking were indeed removed in conference committee once the bill passed the House.

"Although American international bankers eventually got the IMF funding they wanted, the battle was extraordinarily protracted and difficult. Gary Welsh summarizes the lessons of the IMF debate for the political future of American international bankers: 'What the bankers found out from the IMF process was that they weren't popular, which they always thought they were, and that there was a

tremendous misunderstanding of what international lending was all about. The banks learned a tremendous lesson from that: they had done a bad job of communicating with their representatives and senators. We're now trying to build a whole system to disseminate information. We can equip our bankers with material they can go to their community with about the internationalization of the economy, about how we're dependent upon export markets, how imports play an increasingly important and beneficial role in many sectors of our economy, and how banks are a crucial element in financing these flows.'

"The bankers' interests conflict with those of many opponents with political clout and public relations will not eliminate the fundamental disagreement. Welsh concludes that American international bankers will have to rely on their ties with strategically placed policymakers: 'The banks have realized that they don't really have any independent political support in the Congress. Banks can't be up front on the issues; they've got to work very closely with the executive branch. The only way you can get this stuff through is with a strong administration, strong support from the Fed, and strong support from a dozen or so key legislators in Congress – the chairman of the Senate and House Banking Committees, Foreign Relations Committees, the Speaker, people like that. You have to depend on the leadership to carry it through, so that's what everybody's working on.'

"The bankers' harrowing experience of very nearly losing the IMF battle demonstrates that the continued internationalization of financial and goods markets cannot be taken for granted. The IMF quota increase was a relatively small matter that only international bankers and some policymakers felt strongly about. The bill's opponents regarded it primarily as a symbol of overseas economic commitments that irritated them. Even so, the bill would certainly have lost without intensive administration lobbying and skillful work by the bankers' allies in Congress." (Jeffrey A. Frieden, *Banking On The World*, pp. 181-182, 183, 184, 185, 186-192.)

Foreign Ownership of American Based Companies

"While foreign firms have been expanding their exports to the United States, foreign corporations have been moving massively into the country. Foreign investors control American affiliates worth over \$800 billion...." (Jeffrey A. Frieden, *Banking On The World*, p. 198.)

The Most Serious Challenge to International Financial Institutions is Economic Nationalism

"The most serious challenge to America's international financial institutions is the growth of 'economic nationalism,' including everything from trade protection to distaste for the IMF." (Jeffrey A. Frieden, *Banking On The World*, p. 231.)

International Bankers Promote Global Interdependence

"For forty years America's international bankers have been at the center of a world economy whose organizing principle was the free movement of capital and goods, and whose slogan was interdependence....

"The leaders of international finance, along with their allies in the business community, in government, and elsewhere, hope and work for a deepening of contemporary international economic integration." (Jeffrey A. Frieden, *Banking On The World*, p. 235.)

International Bankers Deceive the American People Into Supporting Economic Integration

"During and after World War I, American bankers shot to the pinnacle of the world economy. With the House of Morgan in the lead, American international financiers helped restructure European economies, papered over the war debts controversy, and lent billions of dollars to bankroll rapid economic growth in Europe and Latin America. Yet the bankers' worldwide economic interests often conflicted with the concerns and ideas of American isolationists, who blocked many of the policies preferred by the economic internationalists. Political divisions over America's international economic role reached their high point in the early years of the Depression, when Congress voted sky-high tariffs that helped bring the fragile international financial system crashing down.

"From the depths of the Depression, Americas financial leaders and foreign policymakers cautiously began rebuilding the international financial order. American political support for economic internationalism grew in the late 1930s, and especially during and after World War II. The war destroyed most of the country's fiercest economic competitors and made trade liberalization less threatening. With the onset of the Cold War, international economic cooperation was presented to the public as a necessary weapon in the anti-Soviet arsenal.

"Since World War II, American international bankers and their counterparts in Western Europe and Japan have constructed the largest international financial system in world history. Most contemporary international banking has migrated 'offshore,' to Euromarkets that are largely independent of any single national government. Technological advances allow international fund transfers, lending, and currency trading to take place almost instantaneously between markets thousands of miles apart.

"Modern global banking, and the new international economic realities it has created, challenges the world's political systems. The linkage of national money and capital markets constrains government policies in all countries; billions of dollars ricochet from country to country in response to changes in international interest rates and currency values. Massive international loans helped finance rapid

industrial development in parts of the Third World, and made many of the developed world's traditional industrial plants uncompetitive. Since 1980, the U.S. government has become the world's largest international debtor, and the United States as a whole has become a net debtor nation for the first time since World War I.

"In virtually every nation, the consequence of international financial integration has been domestic political conflict among groups with contending economic interests." (Jeffrey A. Frieden, *Banking On The World*, pp. 237-239.)

National Sovereignty is an Obstacle to Managing an Interdependent World

"The countries of Western Europe and North America, together with Japan, need to collaborate if their own policies are to succeed.... Yet cooperation among these countries encounters serious obstacles, rooted in national sovereignty and democratic politics. The history of the [economic] summit meetings held annually since 1975 between the leaders of the seven largest industrial democracies [Canada, United States, England, France, Germany, Italy and Japan], joined by the European Community, illustrates both the prospects and the problems of managing an interdependent world." (Robert D. Putnam & Nicholas Bayne, *Hanging Together: Cooperation and Conflict in the Seven-Power Summits*, 1987, p. vi.)

Institutionalization of Economic Summitry by Members of the Trilateral Commission

"...The key positions in the new [Carter] administration were staffed by alumni ... of the Trilateral Commission. These Trilateralists were acutely conscious of the tensions between interdependence and domestic politics and of the need to craft a system of collective management to replace American hegemony.

"During 1976 Trilateral Commission task forces had considered how international processes and institutions could be reformed to address these problems. Consultation should be designed to strengthen 'transnational networks of like-minded officials', to foster 'transnational coalitions' among 'the outward-looking forces within each government'. To improve consultation among Europe, North America and Japan a 'Trilateral Staff Group' should be established, composed of 'senior governmental advisers with the personal confidence of the heads of government'. This group would oversee consultations among the trilateral countries, identify unresolved policy problems and seek solutions, and monitor the effectiveness of international institutions. The Trilateralists recognized the importance of 'political will'. But in this framework, summit meetings among heads of state should cap a process of intensive consultations among officials....

"Not limited to atmospherics and warm fellowship, this Trilateralist image of summitry was more ambitious than the Library Group image. The Trilateralist conception took seriously the prospect of international policy co-ordination, along

with the necessity for hard bargaining, transnational coalitions and package deals that might require substantive changes in national policies. If such coalitions were to be forged and such bargains struck, the roots of the summit process would have to reach deep into each government. The horizons of those charged with formulating 'domestic' policy would have to be broadened to include international concerns.

"The Trilateralists did not believe that summits would necessarily take formal and mutually binding decisions, but they did believe that summits should seek to resolve differences over substantive policy issues, not merely 'exchange views'. 'We can't bring the President halfway around the world for a seminar,' Henry Owen, President Carter's personal representative, told his colleagues. The *New York Times* captured the American mood on the eve of the first London summit: 'The most important thing [the leaders] can do is to agree on directives and follow-up machinery for closer co-ordination of economic policy... [This summit] must produce results or begin a slide away from collaboration.' A results-oriented summit, addressing tough, complex issues, would require more organizational infrastructure. Intensive preparation and attentive follow-up were the most distinctive features of the new conception of summitry.

"... [C]areful preparations had been crucial for the monetary accord at Rambouillet, and deficiencies in preparation and follow-up had begun to concern some of the participants at Puerto Rico. Under the aegis of the Trilateralists, the summit process became increasingly institutionalized. Preparations lengthened, and their rhythm accelerated....

"Without question, the single most important factor that encouraged the institutionalization of the summit after 1976 was steady pressure from the Americans. American emphasis on 'co-operative decisions' and summit 'follow-up' was already evident in Henry Kissinger's remarks before Rambouillet in 1975. This more structured approach to summitry reflected both institutional features of the American presidency and a national desire to share the burdens of world leadership. The American propensity for institution-building received a powerful boost from the Trilateralists' carefully elaborated theory about how to manage interdependence collectively. Throughout the Carter years it was the Americans who tended to press for more elaborate summit preparations and for greater specificity in the language of summit communiqués....

"...Conflict in the Western political economy arises, as we have seen, because of international inconsistencies among the policies of interdependent countries. In seeking to resolve such conflicts, summit participants have attempted four types of policy co-ordination:

- Mutual enlightenment, that is, sharing information about national policy directions.

– Mutual reinforcement, that is, helping one another to pursue desirable policies in the face of domestic resistance.

– Mutual adjustment, that is, seeking to accommodate or ameliorate policy divergences.

– Mutual concession, that is, agreeing on a joint package of national policies designed to raise the collective welfare...." (Putnam and Bayne, *Hanging Together*, pp. 48-49, 60, and 260.)

The Awesome Power of the Federal Reserve

"The Federal Reserve System was the crucial anomaly at the very core of representative democracy, an uncomfortable contradiction with the civic mythology of self-government. Yet the American system accepted the inconsistency. The community of elected politicians acquiesced to its power. The private economy responded to its direction. Private capital depended on it for protection. The governors of the Federal Reserve decided the largest questions of the political economy, including who shall prosper and who shall fail, yet their role remained opaque and mysterious. The Federal Reserve was shielded from scrutiny partly by its own official secrecy, but also by the curious ignorance of the American public." (William Greider, *Secrets of the Temple: How the Federal Reserve Runs the Country*, New York, Simon and Schuster, 1987, p. 12.)

Financial Power in the United States

"The legendary 'Wall Street' survived in one respect: New York City was still the center of financial power in America. Despite the rise of new banking centers in other regions, New York remained dominant, rivaled only by California. A crude map of the nation's financial concentration could be drawn from the locations of the largest commercial banks, the core institutions of the financial system. Across the fifty-states, there were more than fourteen thousand banks, but most of them were very small enterprises. Only one hundred and fifty or so banks held deposits of more than \$1 billion. In 1979, only sixteen banks held deposits totaling \$10 billion or more. Together, these sixteen mega-banks accounted for nearly one-fourth of all the bank deposits in the nation.

"The geography of financial power looked like this: eight of the sixteen largest banks were in New York. Five were in California. Two were in Chicago, one in Pittsburgh. A less arbitrary map might also include Boston, whose First National Bank (better known as the Bank of Boston) had \$8.7 billion in deposits, and Texas, which had four banks with deposits between \$4 and \$6 billion. In 1979, the nation's largest bank was the Bank of America in San Francisco (\$86 billion in deposits), but New York had much more aggregate girth than California, led by Citibank (\$70.5 billion), Chase Manhattan (\$49 billion), Manufacturers Hanover Trust (\$38 billion) and Morgan Guaranty (\$30 billion).

"Wall Street's banks were surrounded, moreover, by hundreds of brokerages and investment banking houses that traded stocks and bonds for clients, and, more importantly, raised large blocks of new capital for corporations and governments. A handful of these firms were large enough to be regarded as peers, if not quite equals, of the largest New York banks. Merrill Lynch, leader of the all-service brokers that tended large national client lists, managed \$70 billion in money-market accounts for more than one million customers. Even the largest brokerages, however, depended on the commercial banks as a source of credit, for loans to finance their own investment packaging in stocks and bonds and other ventures.

"The aristocrats of finance, more prestigious and powerful than their dollar volume indicated, were the major investment-banking houses – led by Salomon Brothers, Morgan Stanley, Merrill Lynch Capital Markets, First Boston, and Goldman, Sachs. Some declared their office suites to express the confidence of wealth – darkened paneling and fine old antiques, precious artwork and silver tea services for visiting clients. This is where the nation's most important corporations, along with state and local governments, came in search of capital for their largest projects.

"Capital formation – the flow of accumulated savings into the creation of new productive facilities – was arguably Wall Street's most important function. Capital formation fundamentally determined the distant future, the pace of expansion that created more products, new jobs and expanding incomes. From their lists of wealthy clients, both individuals and institutions, the investment bankers raised the billions lent for sewers or highways or hospitals, to pay for a new factory or the retooling of an old production line. Many ventures were so large that even the most important banking houses were compelled to collaborate with their competitors, pooling the capital each raised and sharing the risks and profits. In 1979, not an especially good year for capital markets, Salomon Brothers would raise \$17 billion for corporations through the sale of bonds and notes and another \$1 billion in new stock issues, plus \$17 billion in tax-exempt bonds for state and local governments across the nation. Like commercial banking, investment banking was highly concentrated. In 1979, the top five brokers managed 65 percent of the capital market, bonds and new stock issues for corporations. The top ten firms managed 87 percent.

"Finance was international, however, and all the largest banks and brokerages operated as multinational financiers. Like oil and wheat, wealth was fungible. It could flow across national boundaries without losing its value, seeking opportunities wherever it found the highest return at the least risk. While the major U.S. banks and brokerages dominated American finance, they were also players on a global stage where they did not seem so imposing. Of the twenty largest banks in the world, only three were American. Germany had six in 1979, Japan had five, France had four and Great Britain had two. The 16th largest bank on the American

map, Mellon Bank of Pittsburgh, was 114th in the global geography, hardly in a position to bully its international competitors.

"Banking power was less concentrated in the United States partly because America's pluralist tradition and federal law prohibited Citibank or Chase or the others from operating nationwide as the major foreign banks could. Collectively, however, U.S. finance was more powerful than other nations'. Nearly a fifth of the world's five hundred largest banks were American, and they were led and dominated by a mere handful of institutions – the nine largest known as the money-center banks, global institutions that operated worldwide and connected American finance to all the pools of international capital... (William Greider, *Secrets of the Temple: How the Federal Reserve Runs the Country*, pp. 25-27.)

The U. S. Financial System and the Federal Reserve

"...The largest borrower in the markets of Wall Street was the government in Washington, which managed a debt of nearly \$1 trillion, raised by government securities, from ninety-day Treasury bills to two-year notes to long-term bonds that would mature in 2009. In one dimension, Treasuries were the safest investment available. After all, if someday the U.S. government failed to pay its obligations, then the country would no doubt be in riotous anarchy anyway and no private property would be safe. In another dimension, however, government securities confronted investors with the same risk as other long-term issues – the risk of the dollar losing its value. The price of U. S. bonds, new and old, was, therefore, highly sensitive to the prospects of future inflation.

"All in all, the financial system resembled the dynamics of a pump house, not an accountant's static balance sheet, and functioned according to physical laws that a hydraulic engineer might understand. It was like a fantastically complicated labyrinth of pipes and storage tanks and boilers, with pressure valves and plumbing and auxiliary pumps, all elaborately interconnected. Inside this system flowed the financial wealth of the nation, back and forth through many channels and tanks, always seeking higher return and less risk, searching out investments that best promised both. To grasp the larger action of finance, one had to visualize its physics. Indeed, that is how financial analysts themselves spoke of it, using hydraulic metaphors to describe its conditions – the 'liquidity' of banks, the 'flow of funds' analysis, 'circulation' and 'float' and 'velocity,' the surge and ebb of 'market pressures.'

"The Federal Reserve Board stood alongside the system like a governor, like a supervising engineer who had the power to alter the flows inside the plumbing. Its decisions could slacken the pressures of the fluids or intensify them; its policies could stimulate the flow of lending or choke it off or nudge it toward different channels. The Fed accomplished this, primarily, by injecting more fluid into the system or withdrawing it – that is, by creating or destroying money. The ability to

create money was the power of sovereigns, almost magical in its simplicity. Central banks inherited the power from kings and, before them, the temple priests of ancient civilizations, leaders endowed by God with the authority to consecrate, *en fiat*, the currency their societies would accept and use. In the technocratic present, the process of money creation remained a powerful mystery to most citizens.

"The Federal Reserve System operated like the modern equivalent of the king's keep – a separate storehouse alongside the private economy and independent of its forces. But the Fed could influence the financial flows inside the plumbing through two tiny valves – mere pinpricks in size compared to all the wealth in circulation. One valve was the Discount window at each of the twelve Federal Reserve Banks, where commercial banks routinely borrowed hundreds of millions, even billions, every day to make up for temporary shortages in their required reserves. The other, more important valve was the Open Market Desk at the New York Federal Reserve Bank in the middle of Wall Street, where the Fed bought and sold government securities in the open market, in daily transactions usually running from \$500 million up to several billion. In both cases, the Fed created money with a key stroke of the computer terminal (computer accounting having replaced 'the stroke of the pen'). When the Federal Reserve bought Treasury bonds from a dealer or lent through the Discount window to a bank, the central bank simply credited the amount to the bank account of the dealer who sold the bonds or the bank receiving the loan. In either case, it did not matter which bank or which dealer got the new money. Once it was created, it increased the overall money supply and was free to float from one account to another through the entire banking system. In reverse, when the Fed's Open Market Desk sold bonds or a commercial bank repaid its Discount loan, money was extinguished by the Fed. By a simple entry in the ledger, the money was automatically withdrawn from circulation in the private economy.

"As any hydraulic engineer could explain, the impact from the Federal Reserve's actions-injecting or withdrawing money – depended entirely on what was already going on inside the plumbing. When the gauges on a boiler show that pressure is dangerously high, then the slightest hydraulic change can send a strong pulse throughout the system, a displacement that spreads like the ripples on a pond. The financial system was similar. If, for instance, the market demand for credit already exceeded supply and interest rates were rising, then a substantial withdrawal by the Fed would send rates soaring. On the other hand, if credit pressures were slack and interest rates were already falling, the same action might hardly be noticed.

"Day by day, the Federal Reserve exerted a powerful influence over Wall Street, but it was not all-powerful. It influenced everything, but it did not control everything. It could set the dials and turn valves, but it could not repeal the fundamentals of economics anymore than an engineer could suspend the laws of

physics. Sometimes, despite the Fed, markets pursued their own direction, driven by contrary perceptions or real economic forces that overpowered the desires of the Federal Reserve Board. Sometimes, trying to change the flow, the Fed turned the wrong valve and produced unintended results. Sometimes, it turned the valve and nothing seemed to happen.

"In Wall Street, therefore, everyone watched the Fed. Every bank and brokerage of any size had full-time economists – 'Fed watchers' like David Jones – who did nothing else. The scores of Fed watchers analyzed the weekly banking numbers, the credit trends and the general economic news and tried to predict Fed decisions ahead of the crowd. They made daily forecasts of the sales and purchases they expected the Open Market Desk to make, but, more importantly, they attempted to foresee the major 'sums' in Fed policy – easing the money supply and credit conditions or tightening. A significant change in direction would send large ripples across the three great financial markets, through the banking system and, ultimately, to the real economy of producers and consumers.

"Of the three great financial arenas, the money market reacted first to Fed moves. Short-term credit rates rose or fell, almost instantly, in reactions to even small changes in the money supply and the Fed's strongest, most direct control was over this market. In the stock market, a Fed 'sum' could launch a major rally or squelch it, but transient gyrations in the stock market did not much worry the Fed.

"The financial market that the Federal Reserve cared about most, respected and even identified with, was the bond market – the place where institutions and wealthy individuals made long term investments and their commitments were most sensitive to the distant future. If the Federal Reserve failed to maintain stable money values, then the bondholders suffered most dramatically." (William Greider, *Secrets of the Temple: How the Federal Reserve Runs the Country*, 1987, pp. 31-33.)

Japan – the World's Best Socialist Society

"Japan is really the world's best example of socialism,' a Nomura investment banker once observed. 'The Russians and the Chinese should come to Tokyo to find out how to mix a planned economy with a market economy. (Quoted in Daniel Burstein, *Yen! Japan's New Financial Empire and Its Threat to America*. New York: Ballantine Books, 1988, p. 106.)

Economic Warfare Among Nations

"Foreign trade is a war in which each party seeks to extract wealth from the other." (Honda Rimei (1744-1821), Japanese Philosopher. Quoted in David Burstein, *Yen! Japan's New Financial Empire and Its Threat to America*, p. 123.)

The Opening of U.S. Markets It is an Ill Advised Policy

"Opening American markets wider than any financial markets had ever been in world history, subjecting them to increased volatility and risk of every kind, and removing even the semblance of coordinated oversight was an ill-advised course under optimum circumstances. But the confluence of those policies with the rise of Japan as a financial superpower has written the recipe for the loss of American financial leadership." (Daniel Burstein, *Yen! Japan's New Financial Empire and Its Threat to America*, pp. 160-161.)

Japan It is the World's Richest Nation

"Japan became the world's richest nation, surpassing the United States in national assets for the first time with \$43.7 trillion worth of land, factories, stocks and other wealth." (*New York Times*. Quoted in Daniel Burstein, *Yen! Japan 's New Financial Empire and Its Threat to America*, p. 237.)

The World Will Be Dominated by a Small Group of Mega-Financial Institutions

"If we believe that the world in the year 2,000 will be dominated by a small group of mega-financial institutions, we must assume there will be many mergers and acquisitions along the way. Nomura's [Securities] capitalization is more than \$50 billion. It could buy the top ten American investment banks for that. Daiwa's [Securities] is also very big." (Daniel Burstein, *Yen! Japan's New Financial Empire and Its Threat to America*, p. 237.)

A Merger of Japan and the United States

"...[M]irroring America's economic decline will be Japan's continued rise, as its financial assets are turned into investments in new technologies and the complete renovation of its domestic infrastructure.

"Two alternatives are likely to present themselves as this contradiction intensifies. Either the United States will be forced to develop a much closer cooperative relationship with Japan, based on a more clearly defined shared agenda, or else the United States will be pushed into sharper conflict and rivalry with Japan.

"As to the first alternative, some strategists and economists both in the United States and Japan see salvation in the so-called *nichibei* economy – a merged symbiosis of Japan and the United States. The word itself is made up of two Japanese characters signifying sun and rice – Japan, the land of the rising sun, and America, land of amber waves of grain – rice, in the Japanese mind. The *nichibei* economy is already a reality in broad strokes: the United States provides Japan's defense, Japan enjoys access to American markets and invests its trade surpluses

back in the United States to help keep the economy going. On the brainstorming list of an upgraded *nichibei* accommodation are ideas like a transpacific common market, a joint U.S.-Japan currency, joint industries, and shared defense burdens.

"Thinking along these lines, former National Security Adviser Zbigniew Brzezinski has called for 'a new global bargain' and the evolution of his own version of *nichibei*, which he dubs 'Amerippon.' In Brzezinski's view this would take the form of 'an informal complex of overlapping elites, corporate structures, and increasingly joint political planning' with the United States and Japan effectively 'commingling...business and financial institutions.'

"C. Fred Bergsten, another former Carter administration official, has suggested the formation of 'G-2' – a joint U.S.-Japan approach to world leadership that would replace the unwieldy 'G-7 and G-5' groups that include other major Western powers. Crumbling American hegemony, Bergsten has suggested, could feasibly be replaced with the 'hegemony' of the United States and Japan leading the global economy together." (Daniel Burstein, *Yen! Japan's New Financial Empire and its Threat to America*, pp. 265-266.)

All Nations Are Loosing Their Independence

"This book [*Yen! Japan's New Financial Empire and Its Threat to America*]... has sketched out large forces at work reconfiguring the global map of wealth and power, triggering the rise of Japan's empire, and draining America of its economic vitality. The dangers of foreigners dictating American interest rates, practicing competitive trade policies that effectively undermine the solvency of large sectors of corporate America, and gaining disproportionate influence over strategic elements of American life from the banking system to the political process on Capitol Hill are not remote nightmares of the future, but increasingly visible realities of the present. As Felix Rohatyn suggests, America has already ceased to be an independent economic power.

"Economists may argue that all nations are losing some of their independence as the world melds into a single globalized economic realm. But as we have seen, what Japan needs from the United States is diminishing in importance; what the United States needs from Japan is growing in importance. The Japanese, moreover, are far more cautious than Americans when it comes to discarding systems that protect national interests. The result is a process of interpenetration that is actually working to make Japan stronger economically and the United States weaker. Globalization, in a sense, has become a code word for Japanese expansion at the expense of vested interests in the world, mostly American." (Daniel Burstein, *Yen! Japan's New Financial Empire and Its Threat to America*, pp. 293-294).

The United States Has Lost Control Over Its Economy

"At 9:30 a.m. on Monday, October 19, 1987, the bell rang on the floor of the New York Stock Exchange signaling the start of the most tumultuous day in the history of U.S. financial markets. A wave of sell orders that had built up over the weekend cascaded over the stock market, pushing its computerized trading system beyond the limits and driving the Dow-Jones Industrial Average down at an unstoppable pace.

"The chaos was repeated at the futures exchanges in Chicago, where harried traders could not keep track of orders, let alone keep up with them. Back in New York, the Federal Reserve Board was forced to demand that the nation's biggest banks provide billions of dollars in credit to keep brokerage houses open. In Washington, the nation's financial regulators conducted frantic telephone conferences in a fruitless attempt to stanch the financial hemorrhage.

"As news of the crashing markets spread, small investors across the country tried to call their brokers at Merrill Lynch and Prudential-Bache and countless other retail brokerages to dump shares at any price before they were wiped out. The sell orders were so vast that phone lines were jammed and thousands of people could not even get through.

"In this era of the global economy and instantaneous communications, the panic spread, and stock markets in Tokyo, Hong Kong, Sydney, and London quivered and prices plummeted.

"By the end of what quickly became known as Black Monday, John Phelan, chairman of the New York Stock Exchange, was saying that the nation's markets had nearly suffered 'a meltdown,' appropriating the terminology of a nuclear disaster to describe a momentous financial disaster.

"The New York Stock Exchange dropped 508 points in a single day, losing 22 percent of its total value and wiping out \$1 trillion worth of wealth. An incredible 604 million shares were traded, three times the volume of a heavy day and double the previous one-day record. The reverberations continued throughout the week.

"For millions of Americans, October 19, 1987, came to symbolize the new vulnerability of their once-invincible nation. It was one of those rare days in history when the shift in power from one empire to another can be marked, precisely and indelibly.

"Behind the stock market crash was a bitter lesson for the United States, a lesson that still has not been learned by the nation's business and government leaders. The crash demonstrated dramatically that the United States has lost control over its own economy, that decisions made in Tokyo can affect the standard of living and well-being of millions of Americans.

"Commissions and panels were created to search for causes in the wreckage of the crash, and they found plenty of villains among the professional speculators and giant institutional investors who had pumped up the market like a giant balloon and then abandoned it in a matter of hours.

"But none of the reports put the official blame on the shoulders of the Japanese investors whose actions had triggered the collapse. The nation's financial markets and the very financing of the federal debt had become too dependent on the Japanese to risk the repercussions of placing responsibility on the investors they had been wooing throughout the 1980s.

"The United States has become addicted to foreign investment....

"No country has invested at the pace of the Japanese, who are benefiting from their own huge trade advantages and basic thriftiness. And no country has carried out its investments with the strategic mandate that motivates the Japanese. As a result, they have gained enormous leverage over certain sectors of the American economy, a fact demonstrated clearly by the stock market crash of 1987....

"But by October 1987, Japanese investors were the dominant players in the U.S. bond market. They basically financed the rising federal deficit by loaning money to the U.S. government through their purchases of treasury bonds. And they were able to push it to the brink of collapse.

"The crash was a graphic example of what happens when a nation loses economic sovereignty to an outside power, even a friendly one. It was a lesson in the perils of the rising levels of foreign investment in the United States, particularly the concentrated investments being made by the Japanese.

"Foreign investment evolves from benign to dangerous when decisions affecting a nation's economic, political, and military destinies are made in foreign capital cities. With it comes a loss of sovereignty, putting the nation in danger of becoming a colony of its foreign owners.

"It is quite possible that within a decade, the United States will find itself in the position of being a satellite of the powerful industrial machine of Japan. When that happens, the life of every American will be touched by the power of foreign investment, from conditions on the job to the cost of a home mortgage.

"Already the United States is a poorer nation because of the vast amounts its citizens owe foreign investors. Real earnings of workers have fallen, and health, retirement, and vacation benefits are less generous than they once were. Although the productivity of U.S. workers has risen about 6 percent since 1977, real hourly wages have dropped 6.5 percent.

"Already the growing U.S. foreign debt has made the country more vulnerable to pressure from foreign investors that influence U.S. interest rates, the value of the dollar, economic stability, political policy, and employment patterns....

"The position of the United States as the world's largest debtor worsened dramatically in 1987, largely as a result of increased foreign investment to finance the federal government's deficit spending. That means a larger portion of the national income will have to be earmarked to pay the interest for years to come. A mammoth foreign debt creates a chronic drain on the vitality of the U.S. economy and strengthens the power of the foreign nations that hold U.S. debt and use their cash surpluses to acquire more and more U.S. industrial facilities and real estate....

"Since the late 1970s, American corporations have abandoned core businesses, often selling them to foreigners. They have lost their technological edge in industry after industry to foreign companies. As a result, the standard of living of most Americans has declined. Average wages have fallen, the gulf between rich and poor has widened, and foreign investors have gained unprecedented control over the nation's future.

"No nation holds more leverage over the United States than Japan, which increased its U.S. investments faster any other foreign country in the 1980s.

"For unlike the United States, when corporate plans are measured by the year or the quarter, the Japanese have a centuries-old tradition of thinking twenty or thirty years ahead. This ability enables them to foresee causes and effects of economic policies and manufacturing decisions from a perspective not used by Americans. It allows them to be patient in laying the groundwork for economic domination of the United States. (Douglas Frantz and Catherine Collins, *Selling Out: How We Are Letting Japan Buy Our Land, Our Industries, Our Financial Institutions, and Our Future*, Chicago: Contemporary Books, Inc., 1989, pp. 5-6, 7, 9-11.)

Foreign Investment in the United States

The 1987 data showed that the British remained the biggest direct foreign investor in the United States, meaning they owned the greatest amount of tangible items, such as factories and real estate. The Netherlands was second, partly as a result of investment that flows through the secrecy haven of the Netherlands Antilles that could actually belong to anyone in the world.

"Japan replaced Canada in third place in direct investments at the end of 1987, according to Commerce Department statistics....

"Further, because Japan lacks the rich soil of the American breadbasket and the oil fields of the Arab nations, its exports must be manufactured goods in exchange for the raw materials it simply doesn't have. Thus, the Japanese are compelled by the simple need for survival to conquer the world's markets with their export-

driven economy. The largest of those markets is the United States. And what could be a better way to conquer an economy than to buy it?

"And they have bought huge chunks of the United States' choicest real estate and invested in its most influential and vital industries.

"Investors from the Land of the Rising Sun have gobbled up huge portions of the most desirable land in Hawaii. They own three-fourths of the beachfront hotels in Honolulu, and in 1987 they bought four out of every ten condominiums that went on the market along world-famous Waikiki Beach. They are buying office buildings and golf courses. And the biggest development project in the history of the islands – the \$3 billion Ko Olina resort – is a joint venture between a local businessman and the deep-pocketed Japanese construction giant, Kumagai Gumi.

"There is a joke on the islands: Two captured Japanese officers are surveying the wreckage of Pearl Harbor. One Japanese officer says to the other, 'Next time, we'll just buy Hawaii.'

"Downtown Los Angeles is 70 percent owned by foreigners, and half of those foreign-owned towers belong to the Japanese. The imprint of the Japanese on the city's skyline will be felt most strongly when Mitsui Fudosan completes a fifty-two-story structure of polished Brazilian and Swedish granite on the most prestigious location in the Los Angeles business district, the corner of Wilshire and Figueroa. Japanese investors own the buildings that house Bank of America's headquarters in Los Angeles as well as the West Coast headquarters for New York's Citicorp and Chase Manhattan banks.

"Far more importantly, the Japanese own five of the ten largest banks in California, which has the richest state economy in the United States, with an output that makes it the eighth largest economy in the world. By 1988, an estimated 100,000 Californians worked at nearly 1,000 U.S. subsidiaries of Japanese companies....

"Hawaii and California, with their view toward the Pacific Ocean and their cultural diversity, are the favorite investment havens for the Japanese; estimates of Japanese holdings in those two states range as high as \$7.2 billion in Hawaii and \$7 billion in California.

"But rather than the stopping point, those two states are only the beginning of the Japanese investment invasion. Across the United States, they own skyscrapers in any city worthy of having a tall building. Of the fifteen largest purchases of existing office buildings by foreigners in the United States since 1986, all have been by the Japanese. They have included the \$640 million acquisition of Arco Plaza in Los Angeles by Shuwa Investments and the \$610 million Exxon Building in New York City by Mitsui Fudosan. Both were the highest prices ever paid for buildings in the respective cities.

"In Chicago alone, the Japanese have bought or built thirteen major downtown buildings in recent years. Nissei Realty paid \$141 million for the forty-one-story Prudential Plaza in 1986 and announced plans to finance a sixty-four-story tower next door. Dai-Ichi Kangyo Bank, the world's largest bank, paid about half that amount for an office building at 101 Wacker Drive. Another giant Japanese bank, Sumitomo Trust, paid \$50 million for the Xerox Center in the heart of downtown Chicago, and a joint venture between a Japanese life insurance company and a Japanese bank expects to complete the \$360 million AT&T Corporate Center in downtown Chicago in 1989.

"Late in the summer of 1988, Kato Kagatsu, a Japanese corn syrup firm, struck a deal to acquire the 2,000-room Chicago Hyatt Hotel, one of the world's largest, for \$260 million.

"'American real estate is cheap, especially to Japanese firms and families,' said Robert Aliber, professor of international economics and finance at the Graduate School of Business at the University of Chicago. 'The Japanese came into Chicago tepidly at first, and now are moving more aggressively.'

"In New York, Japanese interest have acquired at least a dozen major office buildings and hotels in Manhattan. The 1987 acquisitions alone included a \$670 million interest in two of Citicorp's Manhattan office buildings by Dai-Ichi Mutual Life Insurance Company; 666 Fifth Avenue, \$500 million, Sumitomo Realty and Development; 919 Third Avenue, \$325 million, Nomura Securities, and the Essex House hotel on Central Park South by Nikko Hotels, which also developed a giant river front hotel in Chicago.

"In Washington, the list is almost as long and includes such transactions as Nissei Realty's purchase of the American Medical Association building at 1101 Vermont Avenue NW for \$367 million; Mitsubishi Bank's development of a \$200 million office complex called Washington Square on Connecticut Avenue NW; and the \$87 million acquisition of Judiciary Center at 555 Fourth Street NW by the investment firm of Kondo Bosekei.

"Shuwa Investment's \$80 million purchase of the U.S. News and World Report complex in Washington in 1987 amounted to \$480 per square foot, the highest per-square-foot price ever paid for a building in the nation's capital.

"At the end of September 1988, the Japanese made their largest single acquisition of American real estate – the worldwide Inter-Continental Hotel group for \$2.27 billion in cash....

"A report by the Los Angeles-based accounting firm Kenneth Leventhal & Co. said Japanese invested in real estate ventures worth \$13 billion in 1987 alone, bringing their total U.S. real estate holdings to \$26 billion. The study predicted that

Japan's real estate investment in the United States could rise by another \$19 billion in 1988.

"While real estate is often the most visible Japanese investment, it is not the one that raises the most concern for the nation's sovereignty. The real estate will remain here, regardless of what the Japanese do or where they go.

"The truly dangerous penetration of the American economy comes from Japanese investments in financial services companies and manufacturing plants. It is there acquisitions that represent the opportunity to wield power and influence.

"Japanese financial firms have purchased big stakes in some of Wall Street's most respected investment houses, most notably Goldman, Sachs & Co., Salomon Brothers, and Paine Webber. Japan is now home to all ten of the world's biggest banks, and every major U.S. city has branches of the dominant financial institutions. No. U.S. bank ranks among the world's twenty-five largest....

"Clearly the Japanese are not the only foreigners filling up their shopping carts in the United States. Great Britain, the Netherlands, Canada, West Germany, Switzerland, France, Kuwait, Saudi Arabia, Australia, and Sweden have traditionally made forays into the U.S. economy, taking advantage of America's addiction to foreign capital and its openness to foreign investment. They have taken over factories, advertising agencies, farms, mines, dairies, publishing companies, and casinos.

"Some of the most common names on American grocery shelves – and sometimes, the shelves themselves – are actually owned by foreigners. Alka-Seltzer is owned by West Germans, who also have a controlling interest in the A&P Grocery chain. West Germany's Bertelsmann communications firm paid \$500 million for Doubleday & Company. Stouffer, Beach-Nut, Carnation, and Beringer Vineyards – which was founded by one of the half-dozen original Napa Valley families – are owned by Nestle, the Swiss conglomerate. The French own big stakes in Mack Trucks and American Motors. Timex is owned by Norwegians. Santa Fe International, a leading energy company, is owned by Kuwaiti investors.

"Saudi Arabia spent \$1.2 billion in June 1988 to buy half of three Texaco refineries, 1,450 gas stations owned by Texaco, and a distribution network of more than 10,000 independently owned Texaco-brand stations in twenty-three states in the southern and eastern United States.

"In the biggest acquisition yet by a British firm in the United States, British Petroleum Co. paid \$7.4 billion for the 45 percent of Standard Oil Co. it did not already own in 1987. The purchase was only one of several huge acquisitions that helped the British remain the biggest foreign investors in the United States in 1987.

"A year later, British-owned Batus agreed to pay \$5.2 billion to acquire the Los Angeles-based Farmers Insurance Group, the biggest acquisition in California history and a deal that caused a ripple of concern among industry regulators in several states where Farmers does business.

"The drive by the British to repurchase their former colony was strong in 1987 and 1988. Within days of each other in 1987, for example, two deals allowed Britain to replace the United States as the world's premier owner and operator of quality hotels. Allegis Corporation sold Hilton International to the British-owned Ladbroke Group, and Bass PLL took over the international network of Holiday Inns from US Holiday Corp.

"At the same time, Hanson Trust, one of Britain's top ten companies, consumed the New Jersey-based Kidde, Inc., including its assets of Jacuzzi whirlpools and Farberware kitchenware. Hiram Walker of Canada, a subsidiary of the British conglomerate Allied-Lyons, also owns one of California's largest wineries, Clos du Bois. The British also own Smith & Wesson handguns, Ball Park Franks, and a part of Washington's famed Watergate complex.

"Canadians have vast investments in U.S. newspaper, magazine, and book publishing and cable television. Just two Canadian corporations, Thomson Newspapers and International Thomson Organization, own 100-plus newspapers and forty publishing subsidiaries. Seagram, the Canadian brewer, acquired Tropicana Products from Beatrice Companies. And in a hotly contested battle with R. H. Macy over Federated Department Stores in 1988, Canadian developer Robert Campeau paid \$6.6 billion for a retailing and real estate empire that included sixteen branches of Bloomingdale's and 549 other stores. A Canadian company already owned Brooks Brothers clothiers.

"The determination of these foreign bargain hunters was demonstrated by Michael Dornemann, a director of West German publishing giant Bertelsmann AG. He flew to the United States more than fifty times between 1984 and 1986 while deciding how to invest \$1 billion in his company's shopping spree. He visited more than twenty American firms before selecting two targets, RCA record and Doubleday publishing.

"Although Dornemann thought the possibility of acquiring both companies was extremely unlikely, he wooed publisher Nelson Doubleday and John Welch, the chairman of RCA parent General Electric, diligently. Finally, having acquired neither by September 1986, he arranged separate meetings with each company on the same day and he gave the impression that his company could afford to buy just one. 'Either you sell to us, or we'll go to the others,' each company was warned. By the end of the day, Dornemann had a double victory: both companies for a total price of \$805 million.

"Still it is the Japanese who have poured the most money into the United States in recent years, spurring soaring real estate values and turning Main Street Midwest into a virtual subsidiary of the Japanese auto industry....

"For one thing, it is growing much faster. The amount invested in the United States by the Japanese nearly tripled from 1980 to 1985, and the pace of investment has been faster than that of any other foreign nation since 1984. Figures compiled by the U.S. Commerce Department for 1986, while incomplete, illustrate the trend.

"In 1986, Japanese private and government direct investments here outstripped those of any other nation. Of the 1,051 reported transactions, 351 originated in Japan. The total Japanese investment amounted to \$9.3 billion on 170 of those deals, and the government failed to list amounts for the remainder. Great Britain was second with 178 transactions and 83 identified values totaling \$8.1 billion. Canada was third with 114 transactions and 57 identified values totaling \$6.8 billion.

"At the end of 1987, the Japanese were third in total investments in the United States behind the British and the Dutch. Once the final figures are in for 1988, many experts predicting that the Japanese will have surpassed the Dutch to rival the British as the leading foreign owners of the United States.

"Second, the strategy is different from that of other foreign investors. The Japanese are not interested in simple return on their capital or in the type of passive, safe haven Arabs sought for their oil dollars in the 1970s.

"The Japanese are determined to buy access to a country where growing sentiment for trade protectionism threatens to shut them out. In addition, the Japanese also exhibit a definite tendency to target either a geographic area – Hawaii, for instance – or a specific segment of the economy – the auto manufacturing and related parts industries, for example.

"While the strength of the yen made it less expensive for Japanese companies to invest abroad and triggered much of the surge in the late 1980s, the Japanese also diversified, buying more foreign corporations and investing in research and development projects abroad.

"Japanese investments are no longer relegated to securities and government bonds and traditional real estate. They have switched to direct seizures of power by purchasing control of companies. That fact becomes important when coupled with the growth rate of Japanese investment here.

"A 1988 survey of Japan's Economic Planning Agency documented the expansionist drive. After years of shunning takeovers, one out of every three big

Japanese companies planned to expand into foreign markets during the year by purchasing existing companies. The market of preference: the United States.

"More than any other nation, Japan is buying the United States with America's own dollars. The huge trade surplus racked up in Japan is being used to buy control of the world's richest consumer market.

"There is another difference, and it may be the most critical. Decades of European investments in the United States have been the result of a free flow of trade; with some exceptions and more restrictions than Americans apply, European nations tend to be open to foreign investments.

"But the Japanese are taking advantage of the U.S. commitment to free trade while maintaining the industrialized world's most stringent restrictions on foreign access to its markets. For instance, while Japan's giant construction firms built more than \$3 billion worth of projects in the United States in 1987 alone, U.S. firms have been virtually shut out of the construction market in Japan....

"But throughout those decades, the United States maintained an open door to foreign investors while the Japanese have marked their nation with a 'No Trespassing' sign....

"It is essential to recognize that foreign investment in the United States, particularly the strategic purchases by the Japanese, threatens to rob the nation of the ability to control its economic and political destiny. Decisions affecting the jobs of millions of Americans and the health of the economy will be made in Tokyo, not Washington.

"The dilemma may have been best stated by Clyde V. Prestowitz, Jr., former counsel on Japan affairs at the U.S. Commerce Department and author of the excellent 1988 book *Trading Places: How We Allowed Japan to Take the Lead*. At a breakfast with *Los Angeles Times* reporters in Los Angeles in May 1988, Prestowitz was asked about the impact of Japanese investment on U.S. competitiveness, and he said: 'Let's remember that British investments in India turned it into a colony.' (Frantz & Collins, *Selling Out*, pp. 20, 21-22, 23-24, 26, 27-29, 30-33.)

The Emergence of Japan as a Powerful Economic Force in the World

"The pivotal year in the American decline was 1985. For the first time since 1914, the United States became a debtor nation. Just three years earlier, in 1982, the United States was the world's largest creditor nation. But the figures released in 1985 by the U.S. Commerce Department showed that, for the first time since before World War I, the amount of U.S. assets owned by foreigners exceeded the amount of foreign assets held by U.S. investors. And the difference was not small:

foreigners owned \$111.9 billion more in U.S. assets than U.S. investors held in foreign assets.

"The deterioration continued. By 1986 the figure more than doubled. Foreigners held \$1.331 trillion in assets in the United States, while U.S. investors owned \$1.068 trillion in assets overseas, for a difference of \$263.65 billion. In 1987, the difference jumped another \$100 billion.

"By simple terms, that means the United States, like Mexico, Brazil, and a host of other lesser developed countries, took in more foreign capital than it invested abroad.

"The United States has become what Rohatyn called 'a classic model for a failing economic power: increasing levels of foreign debt, a constantly depreciating currency, and a continuing negative trade balance almost regardless of currency levels.'

"This huge international debt means that the standard of living in the United States will decline as the country is forced to make interest payments to foreigners.

"By 1988, the federal government was already paying \$24 billion in interest to foreigners, more than it spends on schools. And interest rates were higher because the United States had to lure foreign investors to finance its profligate spending.

"'We are much like a wealthy family that annually sells acreage so that it can sustain a lifestyle unwarranted by its current output,' Warren Buffett, the legendary investor from Omaha, Nebraska, told *Fortune* magazine in May 1988. 'Until the plantation is gone, it's all pleasure and no pain. In the end, however, the family will have exchanged the life of an owner for the life of a tenant farmer.'

"Or, as Congressman John Bryant, a Texas Democrat, put it: 'America has been selling off its family jewels to pay for a night on the town.'

"During the U.S. decline, Japan emerged as the world's most powerful economic force. IN industry after industry, from automobiles to machine tools to electronics, the Japanese knocked the Americans out of first place in the world. In late 1985, when the United States surpassed Brazil and Mexico and became the world's biggest debtor nation, Japan emerged as the world's largest creditor. Japan's governmental and private holdings abroad surpassed those of Britain and other industrialized nations.

"Richard Rosecrance of Cornell University predicted in 1988 that 'If things continue as they are now, it won't be much beyond 2010 before Japan becomes a leading power in world politics.'

"Statistics tell the story. In 1950, Japan had only 1 percent of the world's exports, and it was a follower in world trade. Not blessed with an abundance of natural resources, Japan imports mineral fuels, crude oil, industrial raw materials, and foodstuffs and grinds them through the machinery of its high-powered economy to export high-tech scientific, electronic, and transportation equipment. Japan's leading exports are autos, communications equipment, audiovisual equipment, office equipment, scientific and optical instruments equipment, and ships.

"As the end of the 1980s approached, Japan had done far more than simply catch up; its share of world trade had grown tenfold, and it had built a trade surplus of \$100 billion.

"Much of that surplus was in dollars, for Japan's success came at the expense of the United States. Import-hungry American consumers have been spending billions of dollars on Japanese cars and video equipment while the nation's manufacturers were buying sophisticated components from Japan. The Japanese then use the surplus dollars to step up their direct investments in the United States.

"'Basically, the VCRs and the Toyotas are coming back,' explains David G. Shulman, director of real estate research at Salomon Brothers in New York.

"America's fading dominance began to cause fear of this rising ride of foreign investment, which in turn fueled calls for controlling foreign purchases and setting up quotas to protect American industries from the threat of foreign competition, particularly the Japanese.

"The Japanese were predictably concern about the threat of protectionism and bashing of their interests in the United States. They responded by stepping up a relatively new trade pattern: setting up plants in the United States. Much of the increase in Japanese investment in the United States has come in the form of new factories or acquisition of existing U.S. plants.

"It's like an insurance policy: Japanese industries evade restrictions on imports by manufacturing goods in the United States through subsidiaries, and thereby also avoid being damaged by the falling dollar. There is also the added benefit of using their U.S. operations to increase their share of the nation's market without boosting the U.S. trade deficit. Such concerns were on the minds of Toshiba executives when the Japanese electronics giant decided to expand in the United States.

"'We first started talking about moving our personal computer production to the United States three years ago,' Daniel M. Crane, vice president for marketing at Toshiba America in Irvine, California, said in late 1987. 'We wanted to insulate ourselves from currency fluctuation; we wanted to be an insider.'

"The increasing presence of Japanese goods in the United States has been referred to as 'judo economics,' a policy that deflects protectionist pressure because of Japan's huge strength in U.S. markets. Often when the United States tries to retaliate against Japanese companies for violating international trade rules, the U.S. actions must be softened because its domestic economy is hurt, too, as demonstrated in the Toshiba incident.

"This is all part of a long-term plan being followed by Japanese corporations driven by the necessity of exporting. The initial phase called for grabbing a big share of the U.S. markets, frequently by reducing prices sharply and sometimes settling for a loss on exports. Establishing a capability in the United States to assemble components made in Japan and thus evade protectionism is the second phase. And the third will be shifting full manufacturing to the United States, including setting up an array of Japanese suppliers to ring its big manufacturing plants. (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 39-41.)

Identifying Foreign Ownership in America

"John Bryant first became interested in foreign investment while serving as a state legislator in Texas in the 1970s. The issue surfaced when Arab investors were believed to be behind the purchases of large parcels of agricultural land in the state.

"When Bryant tried to trace the source of the purchases, he found that most owners were hiding behind a screen of dummy corporations registered in the Netherlands Antilles, a Caribbean haven for investors and other moneymen seeking anonymity. The U.S. Agriculture Department listed 270,000 acres of Texas agricultural land owned by residents of the Netherlands Antilles – one acre per man, woman, and child on the tiny island. Bryant was dubious.

"Most significantly, Bryant was amazed at the ease with which a foreign investor could conceal his identity under U.S. law. He discovered what anyone who makes the seemingly simple inquiry "Who bought what and for how much?" discovers: there is no single U.S. agency tracking such information, collating it, or analyzing it. Although private organizations and individuals have tried to study foreign investment, their efforts are stymied from the start because of the lack of complete information....

"After Bryant was elected to Congress in 1982 from a district that included downtown Dallas and some affluent suburban neighborhoods, he was determined to create a more thorough mechanism for monitoring foreign investment....

"Bryant's initial legislation was more than a simple 'signing in at the door.' The measure would have required foreign investors to register each new investment publicly with the Department of Commerce, disclosing their true identities, nationality, the purchase price of the investment, and their source of financing.

"These requirements amounted to no more than what publicly held American corporations must divulge in annual reports to the U.S. Securities and Exchange Commission or whenever they make a new acquisition. And the requirements were still far less than what most other nations demanded of Americans when they invested abroad. But the proposal would generate outrage from foreign investors and their supporters.

"A more significant element of the proposed legislation was the reciprocity section. It would have prohibited investment in American assets by foreigners unless Americans were permitted to invest in the investor's home country on the same terms.

"Testifying at a committee hearing on his proposal on May 8, 1986, Bryant said, 'As ownership of our economic assets is transferred overseas, so is the power to make decisions affecting the independence and prosperity of Americans. Foreign access to sensitive high technology and research capabilities narrows our strategic and competitive edge. Foreign influence in vital energy and defense industries may endanger our national security; our oil industry is particularly vulnerable at this time. And our economy is becoming so dependent on foreign capital that many respected economists warn that its sudden withdrawal could send us into an economic tailspin.'

"The Reagan administration, which had financed the deficit with big help from foreign investors, was steadfastly opposed to the legislation. Officials from various government agencies countered that Bryant's amendment was, at best, redundant and that current efforts to monitor investment were adequate. They objected to the reciprocity section on the grounds that enforcement would create a bureaucratic morass and place American businesses abroad at risk of reprisals.

"In an apparent coup, Bryant had arranged for supportive testimony from Richard Perle, assistant secretary of defense for international security and a leading voice for the administration on arms matters. However, on the morning of the day his testimony was scheduled, Perle's secretary telephoned to say that he had a conflicting appearance in the Senate and would be unable to appear.

"George Slover, Bryant's legislative counsel at the time, later explained what had happened: 'We knew from things he had said publicly in the past that Perle was very concerned about foreign investment and how little we know about it. There was no official explanation, but what we heard later was that his testimony was not approved by the Office of Management and Budget. It wasn't approved because it didn't toe the party line.'

"Opposition to the proposal centered on the reciprocity section, so in January 1987, Bryant submitted a new version to the House that was titled the Foreign Ownership Disclosure Act. The reciprocity section had been dropped, and Bryant was able to line up thirty-one cosponsors.

"In March, the measure was attached to an amendment to the omnibus trade legislation then under consideration in the Energy and Commerce committee. The bill was adopted by the narrow margin of 21 to 20, after fierce opposition from every Republican on the committee.

"There was a further modification of the disclosure section: it would apply only to the big players, foreign investors with a 'significant interest' of more than 5 percent in any U.S. business or real estate property with assets of more than \$5 million or annual sales of more than \$10 million, and those with a controlling interest of 25 percent or more in a U.S. business enterprise with assets or annual sales of more than \$20 million. The information required would be simpler: identity, nationality, address, date interest was acquired, percentage of investment and purchase price, name and location of U.S. property, and terms and conditions of acquiring interest.

"The amendment included severe penalties or noncompliance and stipulated that the information would be public, indexed by name, nationality, and industry of the foreign investor and by name, state, and industry of the U.S. property.

"Until its passage as part of the trade bill by the Energy and Commerce Committee, Bryant said, his amendment had benefited from Congressman Richard Gephardt's more controversial proposal for trade reciprocity, which distracted the administration from the Bryant measure.

"But once the bill passed the committee and headed toward the floor of the House, the amendment met with vigorous lobbying from a variety of sources with links to or dependencies on foreign investment. Among those fighting the measure were First Boston, the New York investment bank owned in part by a Swiss bank, Credit Suisse; Shell Oil, a wholly owned subsidiary of Royal Dutch shell; and the White House.

"J. D. Williams, a high-powered Washington attorney representing First Boston, called on Bryant to express his concerns about the amendment. He used the good-old-boy routine, cautioning Bryant in a friendly fashion, 'I've been around a lot longer than you, son. If we have to, we can stop you. Too bad, son.'

"In Washington, there is no better measure of a proposal's significance than the amount of money its opponents are willing to spend to defeat it. And the Bryant proposal caused plenty of spending, though there is no way to determine precisely how much. But the list of corporations, domestic and foreign, lined up in opposition to the proposal reads like a *Who's Who* of business in the United States: the American subsidiaries of the Big Three Japanese automakers, Honda, Toyota, and Nissan; British-owned Standard Oil; Swiss multinational Nestle; American Express, the biggest U.S. financial services company; Fujitsu; and even the U.S. Chamber of Commerce.

"Slover fielded more than 100 telephone calls himself from representatives of foreign investors and governments in a six-week period. Most of the callers were lawyers who refused to say which foreign investors or corporations they represented.

"The world on the street was that more money was spent on defeating the Bryant amendment than on both sides combined on any other provision to the trade bill,' said Slover. 'But it was all very quiet. The foreign lobby did not want to arouse any public sentiment. It would be virtually impossible to stir up any grass-roots support for keeping foreign investment secret.'

"Ultimately, the concerns of Shell Oil and First Boston and other big foreign investors were satisfied by a round of modifications. But the Reagan administration kicked its lobbying efforts into high gear and called up heavy hitters such as Paul Vocker, then chairman of the Federal Reserve, and Treasury secretary James Baker to lead the charge.

"As soon as the amendment hit the full committee, Baker started working the Congress hard,' Bryant said. 'For someone who usually calls on chairmen of the various committees, Baker walked the halls of Congress, calling on members, like a common lobbyist.'

"...Bryant began looking for a Senate sponsor. Several senators expressed interest, but then backed off in the face of political pressure. Finally Senator Tom Harkin, a Democrat from Iowa, took the ball.

"Lobbying intensified in the Senate, where representatives of blue-chip foreign and American multinationals joined in opposition with some of Washington's most powerful law firms – on the payroll of foreign corporations and governments – trade organizations, foreign ambassadors, and of course, the White House.

"One lobbyist representing a large multinational corporation called Senator Harkin's office and threatened, 'How would you like it if we pulled everyone right out of Iowa?' An amused member of Harkin's staff said the threat was not taken seriously, and Harkin didn't waver.

"Gary J. Campkin, director of international affairs for the Confederation of British Industry, sent a dragooning letter to the Metrocrest Chamber of Commerce, located in a district neighboring Bryant's outside Dallas. Leaving all subtlety aside, Campkin wrote that if the Bryant amendment were to become law, 'its effect would be to impact negatively on British operations in the United States and also to deter new and future investment proposals. This in turn would mean less job opportunities and economic benefits in the U.S. In addition it opens the door to retaliatory and mirror actions by other countries which could affect British and American investments.'

"Foreign ambassadors threatened that such legislation would send their investors and their money elsewhere. The White House claimed it would undermine the president's efforts to break through other countries' trade barriers.

"Surprisingly, there was also opposition from many American business groups, such as the U.S. Chamber of Commerce and the National Association of Manufacturers. Adopting one of the administration's lines, they said they were worried that foreign governments would retaliate by imposing harsher reporting requirements on U.S. firms in their countries.

"Harkin, speaking on the Senate floor, addressed that brand of reasoning as well as the concerns over chasing away foreign investment: "There are those who say that this bill will discourage foreign investments. I take issue with that. business people bring their money here because it is a good place to invest and because they can make money in this country. Who is concerned with anonymity? Drug traffickers, the PLO, other foreign investors who do not want us to know how much they are acquiring on certain sensitive businesses in this country?"

"Harkin argued that no legitimate business would be afraid to disclose the information required by the Bryant amendment. He pointed out that the disclosure was neither more nor less than required of publicly owned U.S. companies.

"He concluded by crystallizing the danger posed by the laissez-faire attitude toward foreign investment: "The short-term advantages of foreign investment should not prevent us from considering the potential long-term effects on our economy and our national security. Over time, as ownership of our assets is transferred overseas, so is the authority to make important business and economic decisions affecting the prosperity and independence of our nation."

"The threats by foreign companies to abandon the United States and the fears that investments would be withdrawn, however, carried the day. The opposition won a clear victory, sending the proposal down to defeat by a vote of 83 to 11.... (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 45-46, 48, 49-52, 52-54.)

Japanese Buy Influence in Washington, D.C.

"The defeat of the Bryant Amendment and the evisceration of the Toshiba sanctions only hint at the power of the network of paid influence peddlers who work on behalf of the Japanese in Washington and in state capitols across the country.

"In 1988, 152 Japanese companies and government agencies hired 113 firms to represent them in Washington. The next most-represented country was Canada, with 61 organizations representing its interests, followed by the British, with 44.

"Indeed, as Japanese investments in the United States have increased, so has Japan's determination to protect those interests by trying to shape U.S. policy through paid lobbyists, campaign contributions by American subsidiaries, public-relations and advertising campaigns, and even charitable contributions.

"Overall, Japan's government, foundations, and corporations spent at least \$310 million on a range of activities from lobbying to sponsoring public television programs aimed at influencing U.S. opinion, according to an estimate by *Business Week* magazine.

"They are interested in creating an environment in which they can make money,' Bernard Karsh, director of the Center for East Asian Studies at the University of Illinois, told *Business Week*. "I see this as a major effort to come in and stay, to legitimate their presence.'

"It should come as no surprise that the Japanese and other citizens of foreign nations want to safeguard their interests by shaping U.S. policy and influencing debate on issues critical to their well-being. Quite surprising, however, is the cooperation provided to them by dozens and dozens of former high-ranking U.S. government officials who are willing to serve as hired guns for these foreign nations.

"The list reads like a *Who's Who* from the White House to the Department of Commerce to Congress. Senior statesman Elliot Richardson, who has held three cabinet posts and more than a dozen other high-level government positions, represents foreign interests, including an umbrella organization known as the Association of Foreign Investors in U.S. Real Estate.

"James H. Lake, a key adviser to George Bush's presidential campaign, has been one of the most effective lobbyists for Japanese and European interests because of his close ties to the U.S. trade representative's office. During a six – month period in 1987, he met or spoke with U.S. trade representative Clayton Yeutter or his assistants twelve times on behalf of Mitsubishi Electric Corp., just one of his firm's Japanese clients. Mitsubishi paid the firm \$129,000 during the period.

"Richard Allen resigned as national security adviser to former President Ronald Reagan after disclosures that he had accepted funds from Japanese interests. During a Justice Department investigation that determined he did not engage in any illegal activity, Allen acknowledged that during his time as national security adviser, he met with Japanese auto firms while the United States was negotiating import quotas for Japanese automakers. Immediately after leaving government, Allen opened a firm that represented Japanese interests.

"George Bush's former chief of staff, retired Admiral Daniel Murphy, works for a powerful public relations firm, Hill & Knowlton, as head of its international

division. Some of Japan's largest companies are clients of the firm, including Hitachi and the Electronic Industries Association of Japan.

"Peter G. Peterson, chairman of the Blackstone Group, a Wall Street firm with major Japanese clients, is a former commerce secretary and also former chairman of the Council of Foreign Relations and the Institute for International Economics. While not a registered lobbyist for the Japanese, Peterson has emerged frequently as a defender of Japanese interests.

"William Eberle, a former U.S. trade representative, and Robert Strauss, a one-time special trade envoy with the title of trade representative and one of Washington's most effective lobbyists, represent or advise foreign interests, including those of Japan. So does Roderick Hills, former chairman of the Securities and Exchange Commission. Former Defense Secretary Clark Clifford represents foreign interests, and so does William Colby, the former director of the Central Intelligence Agency.

"Former Democratic Congressmen Michael Barnes of Maryland and Jim Jones of Oklahoma were among the army of lobbyists mobilized by Toshiba to weaken congressional sanctions against the company in 1988.

"When Toyota wanted federal approval for a questionable special trade zone in Kentucky so it could receive imported auto parts from Japan duty-free for uses at its new auto plant there, it enlisted the aid of Republican Party Chairman Frank J. Fahrenkopf, Jr., to set up a meeting between Toyota representatives and Commerce Secretary Malcolm Baldrige. The trade zone was approved.

"When Eric Garfinkel was deputy assistant director of commerce and trade in the Reagan administration, he was a key player in the debate over whether to offer the U.S. machine tool industry the option of imposing sanctions on the Japanese in order to protect the American industry. When he left the White House in 1983, he went to work at a law firm where he represented the Tool Builders Association of Japan.

"Walter Lenahan, a deputy assistant secretary in the Commerce Department, was the leader of the U.S. negotiating team for discussion of the extension of an international agreement governing trade in textiles and apparel, two U.S. industries that had suffered enormously as a result of imports.

"Lenahan was given proprietary information by U.S. companies and various American trade associations representing the two industries. He knew what the top priorities of the companies would be, and he was well aware of the concessions the U.S. negotiators were prepared to make in order to get the agreement renewed or at least extended.

"Just days before the team's departure for the talks in Geneva, Lenahan quit the Commerce Department and went to work for the International Business and Economic Research Corporation, a Washington lobbying firm that represented Japan, Hong Kong, South Korea, and the Philippines, the very nations on the opposite side of the table from the United States. He even attended the meeting in Geneva, saying that he was not attempting to influence U.S. policy, but merely advising Hong Kong.

"When a bill was introduced in the Senate in 1985 that threatened to increase U.S. tariffs on Japanese telecommunications equipment, Stanton Anderson, a Washington lawyer and one-time Nixon White House aide with strong ties to the Reagan administration, helped organize the opposition.

"One Washington reporter who covers trade issues said of Anderson: 'He's a very effective lobbyist. Stan Anderson knows within hours what happened at any high-level White House meeting dealing with Japan.'

"At the time of the threatened tariffs, Anderson's law firm represented the Communications Industries Association of Japan, and he was chairman of Global USA, a lobbying firm with a client list that included two Japanese high-technology companies, Kyocera and Fanuc, and a Japanese airline, All Nippon Airways.

"The Senate was unable to muster support for a bill with any teeth. Later Robert Angel, former chief of the Japan Economic Institute, a Washington research organization funded by the Japanese government, told Eduardo Lachica of the *Wall Street Journal*: "Japan hasn't lost a battle since Nixon acted against Japanese textiles. It can buy its way out of any trouble.' Angel quit the institute in a dispute over what he viewed as undue influence over its affairs by Japan's Ministry of Foreign Affairs.

"A study by the General Accounting Office, the chief investigative arm of Congress, raised the image that virtually any sort of expertise acquired while working for the U.S. government is for sale in "Washington to foreign interests.

"The GAO identified seventy-six federal officials who went to work on behalf of foreign interests in Washington after leaving office between 1980 and 1985. Among them were eighteen senior White House officials, twenty-two other high-ranking officials from the executive branch, six senators, nine members of the House, four military officers with the rank of general, and seventeen senior congressional staffers. (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 57-61.)

Japanese Practice Protectionism in Trade Matters

"Reciprocity is the concept that best exemplifies the unfairness behind Japan's invasion of the United States. It also is a concept as important as quality and hard

work in understanding why Japan has emerged as a world economic power since the end of World War II.

"Reciprocity is the notion that the trade door should swing open both ways. Philip Trezise of the Brookings Institution, a Washington think tank, said it simply: 'Reciprocity need only mean balanced opportunities to trade. That indeed is a sensible objective.'

"Along with being a sensible objective, reciprocity is the standard by which many believe trade relations should be measured. When that measure is applied to the Japanese, the world's emerging industrial power fares poorly. A congressional study in 1987 found Japan 'among the nations with the most stringent investment restrictions.'

"A confidential report prepared by the U.S. trade representative's office was even blunter. The language is not shielded in the usual diplomatic tones because nowhere in the forty-page report is its source indicated. The author, a high-ranking official within the trade office, was therefore free to speak his mind in what was expected to be an internal assessment of U.S. access to the Japanese markets.

"Although the report was prepared in mid-1985, it has not previously been quoted from, and more importantly, its arguments are as true today as when they were composed.

"'The issue of access to the Japanese market is one of deep concern to the United States,' said the report. 'Layers of regulatory control, together with the ability of many industrial associations to exercise considerable control over activity in their sectors, makes the Japanese market one of the most difficult to penetrate. This assessment of the Japanese market is held not only by American businessmen, but by businessmen from around the world. It is reflected in the low levels of manufactured imports in the Japanese market.'

"What this means is that the Japanese can sell their autos and stereos and computers in the United States. And U.S. companies are restricted or prohibited from selling the same products, or the ones at which they excel, in Japan.

"What this means, too, is that Japanese corporations can build new plants and acquire anything from office buildings to factories without U.S. governmental restrictions in the United States. Yet whole industries are off limits to U.S. buyers in Japan.

"The degree to which Japan's markets are closed is demonstrated by the trend there to limit imports while its exports have soared. Clearly there are other international economic factors at work. Among them are the monstrous deficit spending of the American government, which has required huge sums of foreign capital, and the unbridled appetite of American consumers for imports.

"But the impact of Japan's protectionism cannot be ignored in assessing the trade numbers.

"Between 1980 and 1985, Japan's exports rose 35 percent and its imports fell 8 percent. The decline in imports came during a period when the Japanese standard of living was improving dramatically. And it came during a period when developments in the United States were going to the opposite direction. U.S. exports declined 3 percent while imports rose 41 percent.

"The numbers on the U.S.-Japan trade deficit show how Japan has benefited from open American markets and closed domestic ones.

"Between 1982 and 1987, the U.S. trade deficit with Japan increased more than 200 percent, rising from \$17 billion to \$56.9 billion. U.S. imports of Japanese goods more than doubled, going from \$37.7 billion to \$84.6 billion. Exports of U.S. goods to Japan, however, rose only about one-third, from \$20.7 billion to \$27.7 billion.

"Many factors played a role in the trade imbalance, but one of them again was Japanese protectionism. American exporters face enormous difficulties in cracking Japan's closed markets, as shown by the years of effort to ship beef there without smothering restrictions.

"Japan's Livestock Import Promotion Council is an example of a misnomer if ever there was one.

"The semigovernmental body was created not to promote imports of beef to Japan, but to restrict them. As one example of the industry associations mentioned in the confidential U.S. trade representative's report, the council controls all distribution of beef and sets prices, often three times higher than the actual import price. The tactic depresses demand among Japanese consumers and allows the economically weak but politically powerful Japanese agriculture sector to survive.

"In addition, the council restricts U.S. beef imports to a specific quota. The quota specifies not only how much can come in, but what cuts – lots of cheap chuck and ground meat, very little sirloin. For instance, in 1987 the quota for all U.S. beef imports was 214,000 tons. Of that amount, only 52 tons could be sirloin.

"The only meat that American firms can export to Japan in unlimited quantities is offal, the collection of scrap meats that the Japanese then turn into a product called 'formed steak.' As a result, the imported U.S. beef most widely available to Japanese consumers is of the poorest quality....

"On a more substantive side, the Japanese have been far less willing to make compromises that would open their critical industries to competition from

Americans or other nations. In such fields as steel, autos, computers, and semiconductors, the Japanese government's protectionism

(Douglas Frantz and Catherine Collins, *Selling Out*, pp. 85-87.)

The Japanese Strategy for Gaining Control of the World Economy

"At a meeting of the U.S.-Japan Businessman's Conference in Honolulu in February 1986, the chairman of Ford Motor Company spoke the lament that characterized American industry in the 1980s.

"I wish someone would tell me that manufacturing is not un-American,' said Ford boss Donald Petersen.

"Yukuo Takenaka, a Japanese-American who advises many of Tokyo's leading industrialists in addition to hundreds of the Japanese companies setting up shop in the United States, used nearly the same language in early 1988 as he sat in his office in downtown Los Angeles.

"Americans seem to have given up on manufacturing,' said Takenaka, head of the Japan section at Peat Marwick Main, the world's largest accounting firm. 'Americans somehow think that manufacturing is second-class work. No one in this country is concerned about manufacturing anymore. It is no longer a desired job to work in a factory. It has become almost un-American.'

"Where does the blame lie? A substantial measure of it belongs to the decade-long orgy of merger mania that swept the nation in the 1980s. It is no coincidence that the economic decline of the United States occurred at precisely the same time that the investment bankers and corporate raiders began their destructive transformation of corporate America.

"Instead of increasing spending to modernize plants and boost budgets for research and development to retain America's competitive position, the nation's manufacturers allowed Wall Street to push them into a self-destructive game of corporate checkers that drained capital and energy and creativity.

"A side effect: until the early 1970s, only about 12 percent of the Harvard Business School graduating class each year went to Wall Street; by the 1980s, fully one-third of each class was going there. Wall Street became the magnet for the nation's brightest young business school graduates, the people who once would have gone to work at General Motors or Lockheed. The money was being made in moving paper, not in creating products. If manufacturing did not look un-American to the nation's brightest young MBAs, it certainly looked unappetizing.

"Another consequence of the merger mania is that U.S. managers have been forced to focus on short-term profits at the expense of long-term development

plans. Operations that do not drive the bottom line, such as the development of new products, are jettisoned. If it is cheaper to buy sophisticated components abroad and simply assemble them in U.S. plants, what does it matter that a company sacrifices technical innovation and devalues inventive and engineering skills?

"By contrast, the biggest companies in Japan are often owned partly by their lenders, so they are able to borrow at lower interest rates and focus more on long-term outlooks than American business does. Richard Drobnick, director of the International Business Education and Research program at the University of Southern California in Los Angeles, said, 'In Japan, you can invest more, ask for lower prices, develop market share, because you don't need to pay it back so quickly. That's no fault of any American company. That's the fault of American economic policy.'

"But the warning signs of a nation at risk were visible well before merger mania was under way.

"The nation seemed to take the wrong fork in the road in the 1970s. The Vietnam War damaged the national psyche, the oil embargo threatened U.S. economic independence for the first time in more than a century, and unemployment and inflation both rose throughout most of the decade.

"The manufacturing sector, weakened by malaise, came under attack from foreign producers. Market after market fell to cheap goods produced abroad – cars from Japan, shoes from Italy, apparel from Hong Kong and Taiwan.

"American industry was disheartened, and its leaders stopped minding the shop. They stopped paying attention to quality and no longer were willing to invest the energy and capital that had paved the way for the post-World War I ascension of American capitalism.

"While America went into decline and began living off foreign capital and developing an addiction to imported goods, Japan was reaping the fruits of an industrial development that had begun in the ashes of World War II.

"Japan's principal aim in World War II had been to gain control of land that would provide the natural resources vital to its economic prosperity. After its defeat, Japan's leaders recognized that they would have to find another way to build the economic sovereignty of their nation. The alternative was evident: the nation's economic power would have to be built on a foundation of manufacturing and exports. The resources would have to be bought, rather than seized, and the value added through a new industrial base.

"In order to develop that base, Japan would keep its markets closed to protect its fledgling industries, and its people would sacrifice through hard work and by

paying more for domestically produced goods than they would have paid for American imports. The driving force was the strategic development of a national industrial base, not the desires of consumers for inexpensive goods – a sharp contrast to the laissez-faire policies of the United States.

"Here another factor surfaces that played a role in what has become known as 'the Japanese miracle.' That factor is the homogeneous nature of the Japanese society. The historic sense of community and national purpose, which had been reinforced by the stinging defeat in the war, is not only unrivaled in a nation as diverse and young as the United States. It is barely understood.

"Perhaps no two cultures are as different as those of the United States and Japan. Americans pride themselves on individual initiative and outstanding personal accomplishments. The Japanese operate within a framework of team play in which the individual's needs are always secondary to the goal of the whole.

"Japanese society extols hard work, loyalty to the company, and a desire to resolve conflicts through cooperation, consensus, and a strong dose of deference to authority. The necessity of building an economy based on manufactured goods became part of the textbooks from elementary schools on up. It was preached by government officials and business leaders and implemented with the help of the nation's most powerful government agency, the Ministry of International Trade and Industry, or MITI....

"Indeed, few American business leaders have been able to understand the concerted nature of the competition they face from Japan. One reason is that the type of coordinated effort embodied in the 1986 meeting of Japanese industrialists is completely antithetical to the U.S. mind-set. The very idea that the chief executives of IBM, General Motors, and Citicorp would sit down for a similar session is unthinkable.

"A few Americans recognized the significance of a new Japanese investment pattern that emerged in the middle to late 1980s as Japan switched from passive purchases of stocks and bonds to direct purchases of U.S. companies and the creation of new plants on American soil.

"The Japanese found that their skills could be exported to the United States, where they could manufacture goods without fear of protectionist tariffs or the volatility of international currencies. (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 103-106, 114.)

The U.S. Economy Is Under Siege

"The U.S. economy is under siege, and the battlefronts are many – from the New York Stock Exchange to Hawaii's hotel industry. To the victor will go rich spoils – possibly entire sections of the U.S. economy, such as the auto industry. As

in a military war and its resulting loss of political sovereignty, economic sovereignty will be tough to rebuild.

"When viewed in the terminology of war, the competition can be divided clearly into various fronts; corporation's assume the role of battalions; and the victories can be counted for what they really are – steps toward conquest.

"One of the single most important fronts today is the auto industry, where the siege by Japanese companies has stripped away jobs and profits from U.S. automakers and threatens to overrun what for years has been the United States' premier manufacturing field.

"In recent years, the Japanese have infiltrated U.S. lines, avoiding quotas and tariffs and gaining leverage to fight protective measures by moving an ever-increasing portion of their manufacturing process to the United States.

"Today, 3,000 years after the residents of Troy pulled a wooden horse inside their walled city and opened the door for their defeat, the Trojan horse has four wheels, a shiny paint job, and power brakes.

"Japan's automakers are the ultimate Trojan horse, and American cities and states are eagerly wheeling them inside. The states and towns swing open the gates and offer tax holidays, public works improvements, worker retraining centers, and special schools for the children of Japanese executives.

"Like the residents of ancient Troy after the long siege, state development agencies and local chambers of commerce hungry for revenue and jobs are blinded to the long-term implications of replacing the American auto industry with a Japanese one.

"'In the 1980s Japanese automakers have invested more than \$5 billion in U.S.-based assembly facilities,' said a March 1988 report by the General Accounting Office, the chief investigative arm of Congress. 'Seven Japanese-affiliated auto manufacturers and more than 100 Japanese-affiliated auto parts suppliers are operating or constructing facilities in the United States.'

"The report went on to reflect a deepening worry: 'The growth of foreign direct investment has led to concerns over the future of the U.S. auto manufacturing and parts supplier industries. Critics suggest that it is causing job losses, reducing the market share for U.S. companies, and contributions to industry overcapacity.'

"More than one in five new cars purchased by Americans is Japanese-made, and some industry analysts predict the total will reach almost half by early in the next decade. Thousands of those Japanese cars actually will be manufactured at plants in the United States, but there is little solace in that phenomenon for the U.S. auto

industry or the thousands of men and women who work in the industry and its related supply businesses.

"The Japanese-affiliated automakers in the United States, called transplants, use fewer workers and more foreign content than U.S. automakers, and the result that many expect is a dramatic decrease in employment in the auto industry in the United States.

"As America's love affair with Toyotas and Hondas and Nissans blossomed between 1978 and the end of 1986, more than 400,000 jobs were eliminated in the U.S. auto industry and related businesses. A 1987 study by the United Auto Workers predicted that another 540,000 of the 1.8 million jobs remaining in the auto and parts industries will disappear by 1990 because of the effect of the Japanese transplant automakers and parts suppliers.

"David Cole, director of the Office for the Study of Automotive Transportation at the University of Michigan in Ann Arbor, put it another way during an interview: 'Japan is creating an economic success where Pearl Harbor failed.'

"Cole recognizes the advantages in the Japanese plants on U.S. soil – after all, the Trojan horse came wrapped as a prize. But Cole also is gravely concerned over the long-term implications.

"Clearly, if Japanese vehicles are going to be sold in the United States, it is better on a net basis if they are assembled here,' he said. 'But any new plant will be more efficient than an old plant, so it isn't a zero-sum game in terms of employment. The customers are the big winners. They are getting better cars at better values. But the dislocations from a social standpoint are enormous. Competition is great, but in terms of the kind of things happening today in the auto industry, competition can also get a little out of control.

"There is almost a total absence of strategic understanding in our society about what this might lead to. Long-term thinking among our politicians is the next election. The Japanese, however, are long-term thinkers. They have specific goals in mind. They look at all the implications of a decision. We don't. We live for today, sometimes tomorrow, but never next year. The long-range strategic implications of major foreign investment and competition for control of assets in the United States have got to be dealt with.

"In a sense, the Japanese are feeding Congress's insatiable desire to spend money. It's almost like Japanese Kobi beef. They take their precious cows, feed them beer, massage them, force feed them. I'm sure the cow is as happy as possible. He probably feels great as he walks up the steps of the slaughterhouse. Are we doing the same thing?'

"To carry Cole's analogy a bit further, one could say that state governments across the United States have been building the steps that lead to the slaughterhouse. In what *Newsweek* called the 'War Between the States,' almost no concession is too great as states fight with each other to land the latest Japanese manufacturing plant. (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 125-128.)

The Japanese Intelligence Service Practices Commercial Espionage

"Throughout history, spies have obtained vital nonmilitary secrets, but such secrets are normally picked up in the course of spying for military purposes. After World War II, however, a new breed of spies developed. They were experts in industrial espionage, primarily agents of the Soviet Union and its satellites whose mission was to steal U.S. technological secrets. The Rosenbergs and the secrets of the atom bomb are perhaps the best-known example.

"For the Eastern bloc nations, however, this commercial spying existed as part of a thorough military espionage apparatus. For the Japanese in the postwar world, commercial spying became the primary focus of the nation's espionage network.

"In a book about the Japanese intelligence service entitled *Kempe Tai*, British author Richard Deacon called the process 'espionage for prosperity.' It was, he said, the only intelligence service with the prime aim of making its nation more prosperous and improving the standard of living for its people.

"After the war, Japan was limited to spending only enough on its military to defend itself. Orthodox intelligence gathering for military purposes was also restricted substantially. Rather than dismantle the espionage apparatus, the Japanese government redirected its intelligence gathering to economic issues and broadened the roster of agents to include almost any Japanese businessman who went abroad. This activity was just as vital and patriotic as gathering military information in a time of war, for the Japanese viewed their economic survival as another type of war effort.

"Spying for prosperity dovetailed well with Japan's historic trait of seeking useful information abroad and employing it at home. So the process played a natural role in Japan's economic rebuilding. It also had the added advantage of supplying another strong link between industry and government in what became essentially the government-planned capitalism of Japan.

"The information gathered by Japanese businessmen around the world and fed into the government-industry alliance enabled the nation to foresee and capitalize on such events as the coming market for consumer electronic goods and the boom in worldwide camera sales. These were the types of shortcuts that played a significant role in helping the Japanese to catch up with their U.S. economic rivals

in the 1960s and surpass them in many fields in the 1970s. (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 195-196.)

Japanese Strategy on Wall Street

"The operative philosophy at work in the financial services industry is actually very simple: If you can't beat them but them. And once they buy them, the Japanese have shown over the past two decades that they will study, study, study and learn to do it themselves so that they can compete effectively and efficiently in every sector of the financial services business in the United States and around the world.

"Competition itself is no danger to the U.S. financial houses or the nation's markets. But if the Japanese cross the threshold from competition to concentration, if they begin to dominate financial markets in the fashion that they dominate, say, the consumer electronics arena, the threat to American independence becomes real and dangerous.

"Ownership of financial institutions, far more than ownership of real estate and factories, implies power, and that power has the potential to jeopardize the sovereignty of the United States." (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 226-227.)

Japanese Ownership of Banks in the U.S.

"Los Angeles is the banking capital of the United States for the Japanese. There are more big branches of Japanese banks in New York, a sizeable number in Chicago. But those offices deal almost exclusively with large corporate clients.

"It is in Los Angeles and California that the Japanese banks have decided to get down in the pits and compete head-to-head with American banks for the hearts, minds, and bank accounts of American consumers.

"There are several reasons why the Japanese have chosen California. First is its rich, diverse economy. If California were a sovereign nation, it would have the sixth largest gross national product in the world, right behind France and ahead of the United Kingdom, Italy, and Canada. The state boasts some of America's richest farmland and most productive manufacturing companies from the high-tech corridor in Silicon Valley to the giant aerospace and defense firms surrounding Los Angeles.

"Next on the list are proximity and familiarity. More than any other state, California is a natural port of entry for Japanese firms coming to the United States mainland to do business. It is the leading trading partner with the Japanese among U.S. states, a gateway to the Pacific Rim for the United States, and an open door to the United States for Japan and the rising economies of Asia. Indeed, by 1988, the

Japan Business Association of Southern California estimated that 1,000 subsidiaries of Japanese companies were doing business in California, employing about 100,000 people." (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 230.)

The Publishing Industry is Being Concentrated Throughout the World

"Those who say no foreigner can dominate such a uniquely American industry need look no farther than the publishing industry to see how it can be done, if one has the money.

"Australian-born Rupert Murdoch has used sheer economic power and an aggressive acquisition strategy to become a major force in publishing in the United States and the world. Indeed, when he purchased *TV Guide*, *Seventeen*' magazine, and the *Daily Racing Form* for \$3 billion in mid-1988, Murdoch became the biggest publisher of consumer magazines in the country.

"When the new properties are added to his existing empire, the breadth is staggering. By the end of 1988, Murdoch owned 150 newspapers and magazines, book publishers, television stations, and the satellite channel under development in England. His U.S. holdings included television stations in Boston, Chicago, Dallas, Houston, Los Angeles, New York, and Washington; the fourth major network, Fox Television, as well as Fox Films; newspapers in Boston and San Antonio, Texas; the magazines *Star*, *New Woman*, *New York*, *Automobile*, *Premiere*, *In Fashion*, and *European Travel and Life*; and the book publisher Harper & Row.

"In Britain, he owned the *Times of London*, the *Sunday Times*, the *Sun*, and *Today*. In Australia, he owned six daily newspapers with an average daily circulation of 2 million. In Hong Kong, he owned the *South China Morning Post*.

"'He's acquiring a larger and larger ability to shape and influence public policy,' said David Wagenhauser, staff attorney for the Telecommunications Research Action Center, a consumer watchdog organization, 'One of the best ways to influence public opinion without holding a political office is to control the media – from past experience it does seem that Mr. Murdoch wants to influence public opinion.'

"In much the same fashion that Murdoch has created a media empire, the world's book publishing industry is undergoing a massive consolidation which has left a handful of multinationals controlling half of the world's market. The new giants are companies such as West Germany's Bertelsmann AG, England's Pearson Group (in which Murdoch holds a 14 percent interest), and America's Gulf + Western, Hearst, and MCA.

"In 1988, Bertelsmann paid \$475 million to add Doubleday to an American stable that already included Bantam, and the French media giant Hachette SA

acquired Grolier for \$448 million...." (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 299-300.)

The Future of U.S. Sovereignty Looks Bleak

"None of the many illusions manufactured during the Reagan era is more dangerous than the shortsighted, politically expedient myth that the sharp increase in foreign investment over the last few years reflects the nation's economic revitalization and stability.

"The reality is that this dramatic escalation is the direct result of the economic decline of the United States, from the deficit spending that turned the nation into the world's biggest borrower to the failures of American industry to keep pace with technological advances.

"The reality is that the influx of foreign capital, particularly from Japan, threatens to hobble efforts to create an American industrial renaissance. The reality is that the sellout of the United States raises the distinct possibility that the nation will lack the political and economic sovereignty to solve the long-term economic problems that have lowered its standard of living in the past decade.

"The United States is too vast, too rich in resources, and too vital to the world's political balance to become a colony of Japan or any other foreign power. But that does not insulate the nation from further deterioration in its economic health and global power unless substantial reforms are instituted.

"Indeed, the effects of colonization have been felt already in the stock market crash of 1987, the discrimination experienced in the workplace by growing numbers of American employees of Japanese-owned companies, the widening influence of the Japanese on the political process, and their domination of industry after industry.

"The simple fact is that decisions that should be made in Washington or New York or Los Angeles or Marysville, Ohio, are being made in Tokyo and Osaka. While this does not mean the United States is likely to become a colony, it does convey the warning that the nation is at risk. Unless a way is found to control foreign investment, particularly that of the Japanese because of their staggering concentration of investments, the future of the United States' sovereignty looks bleak...." (Douglas Frantz and Catherine Collins, *Selling Out*, pp. 331-332.)

House of Morgan – the Most Formidable Financial Combine in World History

"...Until 1989, J. P. Morgan and Company solemnly presided over American finance from the 'Corner' of Broad and Wall. Flanked by the New York Stock

Exchange and Federal Hall, the short building at 23 Wall Street, with its unmarked, catercorner entrance, exhibited a patrician aloofness...

"The old pre-1935 House of Morgan was probably the most formidable financial combine in history. Started by an American banker, George Peabody, in London in 1838, it was inherited by the Morgan family and transplanted to New York to famous effect. In the popular mind, the two most familiar Morgans – J. P. Morgan, Sr. (1837-1913), and J. P. Morgan, Jr. (1867-1943) – are rolled into a composite beast, J. P. Morgan, that somehow endured for more than a century....

"Before the Depression, 23 Wall was headquarters of an empire with several foreign outposts. Seated behind rolltop desks on the Broad Street side, the New York partners were allied with three other partnerships – Morgan Grenfell in London, Morgan et Compagnie in Paris, and Drexel and Company, the so-called Philadelphia branch of J. P. Morgan. Of these, Morgan Grenfell was easily the most powerful, forming the central London-New York axis of the Morgan empire. It was a transatlantic post office for British and American state secrets. Before the New Deal, the term 'House of Morgan' applied either to J. P. Morgan and Company in New York or, more broadly, to the whole shadowy web of partnerships.

"The old House of Morgan...catered to many prominent families, including the Astors, Guggenheims, Du Ponts, and Vanderbilts. It shunned dealings with lesser mortals, thus breeding popular suspicion. Since it financed many industrial giants, including U. S. Steel, General Electric, General Motors, Du Pont, and American Telephone and Telegraph, it entered into their councils and aroused fear of undue banker power. The early House of Morgan was something of a cross between a central bank and a private bank. It stopped panics, saved the gold standard, rescued New York City three times, and arbitrated financial disputes. If its concerns transcended an exclusive desire for profit, it also had a peculiar knack for making good works pay.

"What gave the House of Morgan its tantalizing mystery was its government links. Much like the old Rothschilds and Barings, it seemed insinuated into the power structure of many countries, especially the United States, England, and France, and to a lesser degree, Italy, Belgium, and Japan. As an instrument of U. S. power abroad, its actions were often endowed with broad significance in terms of foreign policy. At a time when a parochial America looked inward, the bank's ties abroad, especially those with the British Crown, gave it an ambiguous character and raised questions about its national loyalties. The old Morgan partners were financial ambassadors whose daily business was often closely intertwined with affairs of state. Even today, J. P. Morgan and Company is probably closer to the world's central banks than any other bank.... " (Ron Chernow, *The House of Morgan: An American Banking Dynasty and the Rise of Modern Finance*, New York, Simon and Schuster, 1990, pp. xi-xii.)

International Bankers Gain Control of Industry in the World

"As the Baronial Age [1838-1913] progressed, the line between finance and commerce would blur until much of industry passed under the control of the bankers...." (Ron Chernow, *The House of Morgan*, p. 24.)

International Bankers Dictate Terms to Sovereign States

"No less than to industry, bankers dictated terms to sovereign states, and countries, like companies, had their 'traditional bankers.' Benjamin Disraeli wrote of 'the mighty loan-mongers on whose fiat the fate of kings and empires sometimes depended.' Byron's witty couplet claimed their 'every loan...seats a Nation or upsets a Throne.' The bankers acquired such power because many governments in wartime lacked the sophisticated tax machinery to sustain the fighting. Merchant banks functioned as their ersatz treasury departments or central banks before economic management was established as a government responsibility. The London banks didn't lend their own funds but would organize large-scale bond issues. Through conspiring closely with governments, they acquired a quasi-official aura. Joseph Wechsberg has referred to merchant banks operating 'in the twilight zone between politics and economics.' This was turf the Morgans would later claim as their own. It was also very lucrative turf, for bankers to sovereign states might also handle their foreign-exchange transactions and pay out dividends on their bonds." (Ron Chernow, *The House of Morgan*, pp. 24-25.)

J. P. Morgan Opposed Free Market Economics

"It seems anomalous that America's most famous financier was a sworn foe of free markets...." (Ron Chernow, *The House of Morgan*, p. 54.)

J. P. Morgan Favored Government Planning

"As we shall see, the House of Morgan always favored government planning over private compilation, but private planning over either...." (Ron Chernow, *The House of Morgan*, p. 56.)

A Tremendous Concentration of Power in Wall Street

"If there was nothing devious about the voting trusts, they created a frightening concentration of Wall Street power. Before the morganization period, more than two-thirds of American railroads had offices outside New York; afterward, most were headquartered there. By 1900, the nation's railroads were consolidated into six huge systems controlled by Wall Street bankers, principally J. P. Morgan and Company and Kuhn, Loeb. In this perpetual-motion machine, Pierpont not only reorganized roads but locked up their future financing. By acting as their trustee or holding a large block of their stock, he ensured bondage to 23 Wall. The banker was strong because the railroads were weak, and however much Pierpont deplored

railroad instability, he thrived on such chaos." (Ron Chernow, *The House of Morgan*, pp. 68-69.)

J. P. Morgan Amenable to Private Central Banks

"The one direct consequence of the 1907 panic was a universal clamor for banking reform. In 1908, Congress passed the Aldrich-Vreeland Currency Act, which created the National Monetary Commission to study changes in the banking system. The commission was chaired by Senator Aldrich of Rhode Island, and the House of Morgan quickly moved to exert influence on it. Perkins cabled Pierpont in London that he and George F. Baker, the walrus-mustached head of the First National Bank, had stayed away from Washington, lest the new legislation be seen as a Wall Street plot. At the same time, Perkins sent a coded cable saying that Harry Davison, Baker's young protege, would be Aldrich's adviser: 'It is understood that Davison is to represent our views and will be particularly close to Senator Aldrich.' Davison had been Pierpont's cool lieutenant during the 1907 panic and had greatly impressed him. When the Aldrich commission was about to depart for a tour of Europe's central banks, Davison went ahead to confer with Pierpont, who wanted a private central bank on the Bank of England model. Davison would be the only banker to accompany the senators and congressmen on their mission.

"A central bank was by no means supported by all Democrats. William Jennings Bryan and the Populists feared that a central bank would be dominated by the same hard-money men who ran Wall Street. They saw it as an institution that would slay the silverites. In many ways, the concept was associated more with conservative, hard-money men. Pierpont was amenable to central banks so long as they were private and had boards composed of bankers. As Pierpont's man on the commission, Davison reflected his mentor's uncompromising preference for banker rather than politician control of a central bank. He also expected such a bank to introduce a 'level playing field' and end the competitive advantage of the trusts.

"In November 1910, in what was billed to the press as a 'duck-shooting holiday,' Davison (now a Morgan partner) and other Wall Street bankers met secretly at the Jekyll Island Club, a palm-shaded seaside compound of turreted buildings off the Georgia coast and a favorite Morgan hideaway. Known as the resort of the one hundred millionaires, Jekyll Island claimed among its organizers Pierpont's chum George F. Baker. Pierpont kept an apartment in its San Souci building.... Here Wall Street bankers worked out their plan for a central bank under private aegis, a system of regional reserve banks topped by a governing board of commercial bankers. Davison, an architect of the meeting, not only got a suspicious stationmaster in Brunswick, Georgia, to keep quiet about his suspicions, but often led the discussion. As Paul M. Warburg of Kuhn, Loeb, one of the key theoreticians at the meeting, later said, 'Davison had an uncanny gift in sensing the

proper moment for changing the topic, for giving the discussion a timely new turn, thus avoiding a clash or deadlock.'

"When Senator Aldrich presented his bill for a central bank to Congress in 1910, the Democrats blocked it. In 1913, Congressman Carter Glass, a Virginia Democrat, used it as the basis for the Federal Reserve Act, although making extensive modifications. President Wilson successfully demanded that the system of twelve private regional reserve banks be placed under a central political authority, a Washington board that would include the Treasury secretary and presidential appointees. Progressives hoped the Federal Reserve would reduce the House of Morgan's unique power. As we shall see, the truth was far more complex, for the bank would skillfully harness the Fed and use it to amplify its powers. In an ironic outcome unforeseen by reformers, it would become the private bank of choice for central banks throughout the world, giving it an incalculable new advantage." (Ron Chernow, *The House of Morgan*, pp. 129-130.)

International Bankers Use U.S. Military Power Abroad to Ensure Loan Repayments

"Henceforth, much of the Morgan saga revolves around incestuous dealings between the Morgan banks in New York and London and their respective governments, intrigue that would drape them in mysterious new raiment. The Baronial Age [1838-1913] was one of unbridled laissez-faire, marked by often unqualified hostility on the part of bankers toward government. But in the dawning Diplomatic Age [1913-1940] there would be an explicit fusion of financial and government power. In time, it would become hard to disentangle the House of Morgan from various aspects of Anglo-American policy. Yet there would also be spectacular instances in which Morgan policy would take on a clandestine life of its own, diverging from official dictates.

"The new alliance was mutually advantageous. Washington wanted to harness the new financial power to coerce foreign governments into opening their markets to American goods or adopting pro-American policies. The banks, in turn, needed levers to force debt repayment and welcomed the government's police powers in distant places. The threat of military intervention was an excellent means by which to speed loan repayment...." (Ron Chernow, *The House of Morgan*, p. 131.)

The House of Morgan Forms Alliance with New York Federal Reserve Bank

"The Pujo hearings had one immediate consequence that seemed to threaten Morgan power. In December 1913, President Wilson signed the Federal Reserve Act, providing the government with a central bank and freeing it of reliance on the House of Morgan in emergencies; the new Federal Reserve System was a hybrid institution, with private regional reserve banks and a public Federal Reserve Board in Washington. Yet the House of Morgan moved so artfully to form an alliance with the Federal Reserve Bank of New York that for the next twenty years it would

actually gain power from the new financial system. The bankers had not yet been tamed." (Ron Chernow, *The House of Morgan*, p. 156.)

J. P. Morgan and Company Develop the Plans for the Federal Reserve System

"One final episode in this last flowering of Progressive reform should be noted. On December 23, 1913, President Wilson signed the Federal Reserve Act. Wilson, of course, had insisted on a Federal Reserve Board in Washington under political, not banker, control. 'There are only two choices,' he said. 'Either to give the central control to the bankers or to give it to the government.' Earlier in the year, Jack had gone down to Washington with the Morgan plan for a central bank under private control. J. P. Morgan and Company had not only formulated a scheme but had it beautifully printed up. When Wilson's close adviser, Colonel House, saw what Jack had brought, he hastily told him to present it to Wilson typed on ordinary paper, lest Bryan and the Progressives think the House of Morgan was dropping off a prearranged plan.

"The Federal Reserve System that went into operation in November 1914 was, in many ways, a Morgan godsend. It took some political heat off the bank. As Fed historian William Greider has written, 'As an economic institution, the Fed inherited the noblesse-oblige role that the House of Morgan could no longer perform – and also some of the resentment.' The diminution of Morgan power was less than met the eye. In many ways, the Washington board, which oversaw the twelve regional banks, was toothless. The New York Fed, in contrast, emerged as the focal point for dealing with European central banks and the foreign exchange markets. So, real financial power remained where it had always resided – on Wall Street.

"The critical position in the new system was the governor of the New York Federal Reserve Bank. Its first occupant, Benjamin Strong, had Morgan written all over his resume. He was a protégé of Harry Davison, who had made him a secretary of Bankers Trust and brought him in as Pierpont's personal auditor during the 1907 panic. There was an emotional bond between the two men. When Strong's wife committed suicide after childbirth and a daughter died a year later, the Davisons took the three surviving Strong children into their home. Strong then married Katherine Converse, daughter of Bankers Trust's president, and had become president himself by 1914.

"That year, when the New York Fed job became available, Strong balked at taking it. Not only had he supported the bankers' Aldrich plan, but he had even campaigned against the Federal Reserve Act. Only after spending a long country weekend with Harry Davison and Paul Warburg did he take the job. Strong wanted to endow the New York Fed with the dignity and prestige of the Bank of England. The House of Morgan directed him to Teddy Grenfell for tutorials on how that bank operated. Through Strong's influence, the Federal Reserve System would

prove far more of a boon than a threat to Morgan. The New York Fed and the bank would share a sense of purpose such that the House of Morgan would be known on Wall Street as the Fed bank. So, contrary to expectations, frustrated reformers only watched Morgan power grow after 1913." (Ron Chernow, *The House of Morgan*, pp. 181-182.)

House of Morgan Supports Internationalists

"During the Republican-dominated 1920s, bankers probably attained their peak of influence in American history. It would be the heyday of Morgan power....

"...By instinct and self-interest, the Morgan bank was liberal and internationalist on global financial issues. It advocated U.S. leadership, close consultation with the Allies, and vigorous lending abroad. On foreign policy issues it felt some kinship with Wilsonian Democrats. With England handicapped in its resumption of foreign lending, J. P. Morgan and Company wanted the United States to inherit British leadership and initiate the rebuilding of Europe. The Harding brand of Republicanism, by contrast, was provincial, protectionist, and wearily contemptuous of European conflicts. These Republicans regarded foreign loans as ways to manipulate foreigners or as wasted welfare payments better spent inside America. Throughout Morgan history, the bank would be strongly drawn to internationalist leaders, not necessarily Republican." (Ron Chernow, *The House of Morgan*, pp. 225-226.)

Private Bankers Now Preside Over the Global Financial System

"A new breed of money mandarins has thrived in a 1980s atmosphere of deregulated high-stakes global finance. Aided by a revolution in information and communications technology, private bankers now preside over an integrated network of global finance, leapfrogging national boundaries in the same way as the communications satellite which recognizes no borders. The corporation has become dominated by financial wizards who know little about production but everything about leveraged buyouts and takeover strategies. In government, policy makers, trained to deal with the real problems ... have been swept aside and replaced by officials from the Federal Reserve and Treasury departments whose expertise is money and finance. Public money mandarins, therefore, comport with their private counterparts in banks and corporations to govern the symbols of a world economy...." (Howard M. Wachtel, *The Money Mandarins: the Making of a Supranational Economic Order*, New York: M. E. Sharpe, Inc., 1990, p. 3.)

Americans Are Entangled in a Web of Global Financial Arrangements

"American international banks have entangled each one of us in global financial affairs, whether or not we choose to be. About fifteen hundred banks throughout the United States are part of Third World loan syndicates put together by the major international banks. Part of each deposit we make is at risk in these Third World

loans, as it would be with any other. But it is the enormous size and concentration that makes the difference. About \$550 billion were owed in 1984 to private U.S. banks by Third World and East European countries whose ability to repay these loans is periodically in doubt." (Wachtel, *The Money Mandarins*, p. 10.)

International Bankers Have Reduced the Sovereignty of the United States

"The United States ... has simultaneously become much more dependent on the world economy and much less able to dictate the course of international economic events.... Private entities, often operating outside the direct control of any government, have reduced sovereign power in general and that of the United States in particular." (C. Fred Bergsten, quoted in Wachtel, *The Money Mandarins*, p. 11.)

A System of World Economic Governance By Supranational Banks and Corporations

"Policymakers see the world economy divided into two parts. The first is private market-regulated competition among corporations and banks based in different countries. The second involved public relationships among nation-states governed by international public rules. The supranational economy, however, increasingly dominates the commanding heights of the world economy, and it is distinct from this traditional way of thinking about the international economy. In the ungoverned supranational economy, private commercial, financial, and communications enterprises circumvent both domestic public regulation and international public rules by operating outside the regulatory reach of governments. The supranationals pursue their own global strategic interests, which can be at odds with the national interests of their countries of origin. The end product is a system of world economic governance with parameters defined by the unregulated market and rules administered by supranational banks and corporations." (Wachtel, *The Money Mandarins*, p. 14.)

Global Companies Weaken the National Sovereignty of Nations

"The more familiar term used to describe the modern commercial enterprise in the world economy is 'multinational' or 'transnational.' Neither, however, captures the essence of the evolution of private global economic interests in the late 1970s and 1980s. 'Multinational' refers to enterprises operating in many nations; 'transnational' conjures up an image of firms operating across national boundaries. 'Supranational' embraces both of these images but is preferable because it means that private interests can operate beyond the boundaries of national governments, thereby escaping national policies, while at the same time the supranationals use their influence to leverage policy changes in their home governments....

"Supranationalism weakens the nation-state's ability to control its own economic destiny...." (Wachtel, *The Money Mandarins*, pp. 14-15.)

The Emergence of a Supranational Economic System

"Two important changes occurred in the 1970s that expedited the development of a supranational economic order. The first was the decision to deregulate the international monetary system between 1971 and 1973, following the collapse of the postwar Bretton Woods arrangements. The second was a communications and information revolution that transformed banking and money." (Wachtel, *The Money Mandarins*, p 15.)

A World Economic Order Fashioned By Private International Bankers

"A world economic order emerged in the 1970s fashioned by private commercial and banking interests in pursuit of global profits wherever they arose and with whatever consequences for public policy." (Wachtel, *The Money Mandarins*, p. 16.)

International Bankers Devise Ways To Make the Dollar An International Currency

"The defining characteristic of the pre-eminent economy is that its national currency is also the international currency..."

"Between 1946 and 1950, several mechanisms were devised to move dollars from the United States to Europe and Great Britain that reflected both the internationalism of Bretton Woods and the economic pre-eminence of the United States. One institution, created at Bretton Woods for this purpose was the World Bank, whose actual name describes its functions precisely: the International Bank for Reconstruction and Development (IBRD)....

"The role of the IBRD was to raise capital in the United States and Great Britain, primarily, and then use the dollars and pounds to make loans to the war-devastated countries of Europe – roads, electric power, mass transit, and the like. Today, the World Bank makes loans only to the poorer countries in the world. This change in its orientation occurred around 1960; prior to that time, its lending attention was directed toward Europe.

"In 1946, when the World Bank opened its doors in Washington, it was capitalized at \$12 billion – a combination of capital subscriptions from its members and authorization to borrow. Only about \$2 1/4 billion dollars was available, however, in 1946.... The capital endowment was the foundation that enabled the IBRD to raise more money on Wall Street and in the City of London by issuing bonds and selling them to private institutions and individuals. It still does this today. The World Bank stands as a financial intermediary between the borrower and the individuals and institutions that are prepared to place their money in its care. It absorbs the risk associated with the investments of the country-borrowers. The Bank leverages its initial endowment into additional funds raised in

private capital markets by providing a security curtain and the umbrella of confidence that tags along with any institution called The World Bank.

"A large investor or bank was reluctant to lend money directly to European countries after the war in view of the bleak prospects for a rapid return on that investment. In addition, the scale of capital needs – tens of billions of dollars – was beyond the limits of the private capital markets. However, when the World Bank entered the picture to raise capital, it received a good response because of its name, its capital endowment, and the security underwritten by the full faith and credit of governments.

"The export of capital through the World Bank quickly became inadequate to meet the large investment needs in Europe...

"With the start of the Cold War, the means for exporting capital to Europe took a bilateral twist. President Harry S. Truman inaugurated two large capital export programs – Point Four aid for Greece and Turkey and the Marshall Plan that kept the flow of dollars going from America to Europe to support their infrastructure reconstruction. Bilateral lending – no longer justified on internationalist grounds but on Cold War exigencies – was the second way in which dollars were shipped to the rest of the world, enabling the U.S. to fulfill one of the critical international currency functions: providing the rest of the world with dollar liquidity.

"To the World Bank and bilateral loans was added a third mechanism for the movement of dollars overseas: military installations. Facilities were constructed and soldiers paid in dollars. These dollars were exchanged for local currencies and found their way into the central bank coffers where the military bases existed. In this way, dollars moved from the U.S. Treasury through the military to foreign central banks in support of international trade.

"Yet a fourth mechanism for the acquisition of dollars by another country was through investments by American companies. Here is the origin of the modern multinational corporation. Some of this investment by American companies piggybacked on either World Bank or bilateral lending programs. The Marshall Plan administrators, for example, would develop a steel factory project in Belgium and invite participation by American companies. U.S. auto companies, which still have an enormous market in Europe, piggybacked on the Marshall Plan, as did retailers, producers of consumer goods, and virtually any other product one can think of. The normally circumspect U.S. Department of Commerce under President Ronald Reagan concedes this point: 'Relatively large amounts of U.S. government aid to the war-torn European economies (the Marshall Plan), much of it for rebuilding infrastructure, set the stage for large amounts of private U.S. direct investment in Europe. The demand for dollars – an obsessive demand in the first years after the war – opened up vast opportunities for American corporate

penetration that will never be replicated." (Wachtel, *The Money Mandarins*, pp. 36, 40-42, 44-45.)

Eurodollars Are In the Hands of Private International Bankers

"For every dollar in a bank or savings and loan association inside the United States, there is another 50 cents held in banks outside of the country that are beyond the regulatory reach of the banking safeguards we take for granted. This mystery money is called Eurodollars – dollar deposits in both U.S. and foreign banks in other countries...

"Eurodollars represent the first truly supranational form of money. Their growth and evolution are completely in the hands of the private banking system and answer to no government or public authority – whether national or international...

"In 1984, there were over 1 trillion Eurodollars in the world economy which support international trade and form a significant part of world monetary reserves....

"In the past decade, this supranational currency has become a dominant force in international financial markets, in worldwide banking, and in the lending activities of U.S. supranational banks..."

(Wachtel, *The Money Mandarins*, pp, 91, 92, 93.)

Offshore Supranational Banking Sanctuaries Established to Avoid Taxes and Regulations

"Panama is known for its canal and its hats; the Bahamas and Cayman Islands as sandboxes for the rich; Hong Kong and Singapore for their sweatshops. In the 1970s, however, these places also became the locations for the fictitious receipt of billions of petrodollars deposits and for the fictitious booking of billions in Eurodollar loans – 'fictitious' because the money never really roosted there, except for the instant of time when it appeared as a bookkeeping entry on a computer tape in the New York headquarters of the supranational banks. Fearing a freeze on their accounts, the OPEC countries did not want their vast petrodollar surpluses to be vulnerable in any way whatsoever, and they insisted, therefore, on the safest venues for their Eurodollar accounts. The supranational banks wanted to avoid taxes and regulations that would inhibit the earning capacity of their new-found Eurodollar cornucopia. And several Third World countries obliged by providing the safe haven for both the banks and the OPEC depositors.

"In the 1960s, the City of London was the prime location for Eurodollar activity, but it lost out to less-regulated enclaves in the 1970s because the British government started to regulate foreign banks, and in 1975 they imposed a tax on the earnings of foreign banks...

"According to a study by the Organization for Economic Cooperation and Development (OECD), there were 803 branches in the Third World offshore banking centers in 1978-1979, compared with 875 in all of Europe and Great Britain. (Wachtel, *The Money Mandarins*, pp. 110, 11.)

Citibank is a Model Supranational Bank

"The very model of a modern multinational monetary machine is America's second-largest bank, First National City Bank of New York, known better by the name of Citibank and described by Ann Crittenden of the *New York Times* in 1977 as the 'most truly international bank in the world' In 1982, *Business Week* reported that Citibank's thirty thousand 'employees located in 1,490 offices in 94 foreign countries ... generated 67 percent of its deposits and 60 percent, or \$448 million, of its net income from abroad.' 'When Citibank advertises that it never sleeps,' says the economist Robert Heilbroner, 'it speaks more literally than most people know. As evening comes to America, United States bank deposits are, in a sense, released from duty, because no transactions take place for which their tutelary presence is required. Therefore, the out-of-service deposits are loaned overnight by Citibank and all other big banks to financial centers such as Hong Kong or Singapore, where the business day has just begun. There the deposits play their formal role of backing credit transactions until the sun sets in the Orient and the time comes for the funds, like Cinderellas, to return to work in America.'

"The genius behind Citibank's empire is Walter Wriston, who transformed it from a 'New York bank with some foreign branches ...' into 'a worldwide financial institution,' whose 'strategy is not one of making loans,' but 'of making money.' (Wachtel, *The Money Mandarins*, pp. 113-114.)

The Development of International Banking Facilities Inside the United States

"If you can't beat 'em, join 'em. That seemed to be the public policy posture toward the supranational banks in the late 1970s and early 1980s, when a remarkable entity was created, called the International Banking Facility, or IBF for short. In effect, the IBF reproduces inside the United States an almost exact replica of the offshore banking sanctuary.

"Since October 1, 1981, the Federal Reserve Board has permitted states to establish 'enterprise zones' for banks, where the international activities of the banks are exempt from taxation, reserve requirements on their deposits, and government insurance on their deposits. Restricted to so-called 'nonresident' activity, deposits could be received from U.S. or foreign individuals and corporations, but they had to be initiated from outside the country. Loans were treated in the same way; so long as they were received outside the United States, they could be made to American multinational corporations, U.S. citizens, or foreign citizens and corporations. These free trade zones permitted the banks to operate onshore as they had been doing offshore, with one minor technical exception: the onshore IBFs had

to hold deposits for at least two days instead of the overnight waiting period offshore. Aside from this minor inconvenience, supranational banks were able to replicate inside the United States the favorable position they had developed offshore." (Wachtel, *The Money Mandarins*, p. 116.)

Bankers Fear a Run on Their Bank

"A cartoon caption in the *Guardian*, the British daily newspaper, sums it up: 'People Aren't Working, But the Economy It is.'

"Lurking behind this illusory economic miracle was a banking system that was as delicately balanced as a high-wire act. Between 1982 and 1984, there were about 150 bank failures, in contrast to the 6 to 10 per year during the 1960s and the 1970s. Only during the depths of the Great Depression was there a similar three-year period of bank insolvencies in this century (between 1936 and 1938 there were a little over two hundred bank failures). In addition to the outright bank failures William M. Isaac, chairman of the Federal Deposit Insurance Corporation, disclosed that there were 797 banks in 1984 'listed by . . . three federal banking agencies as problem institutions requiring special supervision' – more than twice the peak reached after the 1973-75 recession...." And this does not take into account what the economist Michael J. Boskin describes as the way in which 'government agencies have...made liberal use of creative accounting to keep institutions apparently solvent many years after they became fundamentally *insolvent*.'

"What bankers fear most is a run on their bank, when depositors lose confidence and withdraw large sums of cash from their accounts. Sometimes the run forces the bank to close its doors; other times the bank survives but at the expense of its credibility. From the Great Depression to 1980, there was only one major run on an American bank: Franklin National Bank's run in 1974, which precipitated the largest American bank failure in over thirty years. Between 1980 and 1984, however, there were five large runs on major banks: First Pennsylvania (1980), \$925 million; Greenwich Savings Bank (1982), \$430 million; First National Bank of Seattle (1983), \$900 million; First National Midland of Texas (1983), \$800 million; and the whopper – Continental Illinois (1984), \$15 billion. The *Wall Street Journal* reporters who compiled these statistics point to two contributing factors: the enormous concentration of deposits in a few hands that feeds any speculative run on a bank and the fact that 'large depositors...have access to modern-day telecommunications networks that carry news and rumors faster and farther than ever.'

"The \$7.5 billion bailout of Continental Illinois, the nation's eighth-largest bank, in 1984 was only the latest installment paid on the government's financial commitment to prop up the supranational banking system. It began ten years earlier with Franklin National Bank, a major international bank based on Long Island that

ranked among the top twenty in size in the United States. Franklin, like its German counterpart, Bankhaus Herstatt, which also found itself in difficulty at about the same time, thought it would make a killing in the new deregulated foreign exchange markets. The only problem was that it misjudged who would be the victim. With about 30 percent of its total deposits offshore in London and Nassau, Franklin was the epitome of the new breed of supranational bank: brash, innovative, and overextended in chancy foreign loans. Between May and October of 1974, nearly \$3 billion was withdrawn from Franklin – about a third from its offshore deposits – and the bank was forced to close its doors. Herstatt, also shoulder-deep in risky foreign dealings, shut down at the same time. The shock waves that rippled through the world's financial boardrooms were only a hint of what was to come later. But for the depositors in Franklin, and its other creditors who did not have the foresight to act in time, it was years of anxious waiting before their claims were adjudicated." (Watchel, *The Money Mandarins*, pp. 138-140.)

The Mega-Bailout of Continental Illinois by U.S. Taxpayers

"Ronald Reagan, the all-time champion free-marketeer, presided over the largest government nationalization in American history: Continental Illinois National Bank and Trust Company, in the spring and summer of 1984, a \$40 billion supranational bank and the country's eighth largest before it was assaulted by an enormous worldwide run on deposits. Like many supranational banks, Continental was over-extended in risky foreign loans and chancy loans to oil-exploration companies. It had made a bad portfolio worse when it purchased about \$1 billion of problematic energy loans in 1982 from the failed Penn Square National Bank in Oklahoma City. Continental had to raise about \$8 billion per day (half from foreign sources), called 'overnight money,' in order to open its doors each morning and conduct business. About 40 percent of the bank's deposits were in Eurodollar accounts.

"When the bubble burst, Continental was hit first by large withdrawals from its Eurodollar deposits. 'It's fine to fund your Eurodollar assets Eurodollar deposits, but Continental's mistake was using Eurodollars to fund their domestic loans,' the chief funding officer of another large international bank told the *Washington Post*. 'The Eurodollar market is one in which concerns can get out of hand swiftly and it's difficult to get them under control quickly.' With domestic deposits, a bank can telephone its large institutional depositors and implore them to sit tight and not precipitate large withdrawals. Such tactics are not as effective in the impersonal supranational Eurodollar market. After the rumor mills took over, everyone joined in, and when the dust had settled an estimated \$15 billion to \$20 billion had been pulled out of the bank, \$4 billion in one three-day period. The issue facing the Reagan administration was what to do with one of the country's largest banks, whose collapse six months before a presidential election could possibly set off a chain reaction that would bring the entire financial house of cards down with it.

"The solution that emerged was de facto nationalization. The Federal Deposit Insurance Corporation (FDIC), the federal agency that insures bank deposits, agreed to 'purchase' between \$3 billion and \$4 billion of bad debts held by Continental in return for stock in the bank and the right to name a new executive team that would run the bank within a strategy devised by the FDIC. That strategy called for downsizing the bank to about a \$20 billion enterprise that concentrated its banking energies on regional needs instead of the supranational, high-flying business that had gotten it into trouble.

"Commentators from within the banking industry lamented the demise of the supranational banking culture inside continental that would occur through this reorganization. James Wooden of Merrill Lynch told the *Wall Street Journal* that he thought the 'culture shock has to be incredible,' as the reporters put it, 'when low-paid FDIC regulators start calling the shots at Continental.' The plan to reduce Continental to a regional bank caused James D. Lowry, head of Equimark Corporation, to say: 'Culturally it isn't built that way. When the mind-set has been for so many years, 'We only deal with the mega-companies and the big bucks,' you can't turn around and start saying, 'It's a great honor to lend \$5 million to a guy in the machine-tool business.'"

"While bankers worried about Continental's pride and what might happen to the psyches of the new breed of supranational banker, the federal regulatory authorities knew they had to do more to stop the run on the bank than merely reorganize its management team. An infusion of cash of about \$7.5 billion was put together to assure depositors that Continental had enough money in its vaults to cover depositors' accounts and, thereby, plug the bank's leaky financial structure. The Federal Reserve bank of Chicago put up over \$5 billion, the FDIC more than \$2 billion, while twenty-eight private banks gave Continental an additional \$4 billion line of credit to draw on if they needed the money.

"The FDIC, in an unprecedented move, also announced that it would guarantee all deposits – even those over the \$100,000 level that is their statutory obligation and is displayed on decals in the windows of banks. The treasury secretary, Donald Regan, defended the FDIC's new role as lender-of-last-resort: "We want to make sure that in these perilous times, there is no doubt that we will support our banks. That doesn't mean that every bank will remain afloat, it doesn't mean that every bank will remain independent. But nevertheless, we will make certain that there will be no calamities in the banking system." But as the chairman of the House Banking Committee, Congressman Fernand St. Germain (D-Rhode Island), says: "The truth is that large banking institutions, despite all the talk about free enterprise, marketplaces and deregulation, do not fail under our system of government protection.

"Were there other options? Probably not, because the problems at Continental had been left to fester too long. The bank regulators had come to believe their own

reassuring statements that they periodically issue about the soundness of the American financial system. Faced with the Continental tremor, however, and the hypothetical horror of a complete financial collapse, the 'Reagan administration responded by propping up the ... system with massive government handouts, notwithstanding their persistent ideological defense of individual initiative and limited government intrusion into the economy. 'Coercive vulnerability is the ploy the bankers use so successfully in extracting federal aid,'" says the financial consultant Jamas Gipson, 'providing fresh public loans to paper over dubious private ones.' But the 'new loans do not come cheap,' he says and 'the effect of the administration's rescue policy is to leave the past profits in private hands while shifting the present and future losses to the taxpayers.' (Wachtel, *The Money Mandarins*, pp. 146-149.)

The Solvency of the Financial System is Periodically In Jeopardy

"The Third World has accumulated debt that cannot be managed without severe austerity, absent an alternative vision of structural reform in the global economy. The United States government is running a budget deficit that sucked in about \$850 billion from the rest of the world in 1984 to fund the highest federal government borrowing in its history. Banks are so overextended in their loan portfolios that the solvency of the financial system is periodically put into jeopardy. (Wachtel, *The Money Mandarins*, p. 150.)

The Quest for Short-Term Financial Gain by Global Corporations

"Between 1979 and 1984, almost a quarter of a trillion dollars was invested by U.S. firms abroad. During the decade of the 1970s, when supranationalization matured, foreign investment by U.S. multinationals grew at an average annual rate of nearly 19 percent compared with only a 12 percent rate of growth of investment inside the United States on average each year....

"...The multinational corporation, as *Business Week* noted in 1978, is an institution whose 'basic aim is to maximize world wide profits, without regard to source of product or national boundaries. U.S. multinational managers have no business reason, therefore, for preferring to export American-made products rather than producing the same goods in foreign plants. This authoritative magazine of business affairs saw no reason to change its view in 1980 when it went even further with analysis of the modern corporation:

"For 25 years, U.S. companies have been participating in the global market by investing heavily overseas.... Aided by an overvalued dollar, U.S. corporations bought heavily into European and Third World industry.... The mind set of corporation executives ... is based on selling products manufactured by plants and equipment overseas. Exporting from the U.S. is quite alien to most corporate executives, and the change in mentality itself will be traumatic.'

"A corporate culture that values the short-term financial ploy over long-term productive investment inside the United States, while shifting its standardized manufacturing activity to other countries, poses a serious problem for employment in the American economy during the remainder of this century and beyond." (Wachtel, *The Money Mandarins*, pp. 162-163.)

The Creation of Giant Monopolies Poses a Threat to Democratic Institutions

"In the six years from 1979 to 1984, nearly \$450 billion was spent in some fourteen thousand separate transactions by American corporations buying other corporations. These 'recent large-scale mergers,' says T.F. Russell, chairman of Federal-Mogul Corporation, 'have added nothing to the economy, and may have diverted investments from areas that needed beefing up.' The megabuck mergers involve companies that fueled America's great industrial revolution and made it the workshop of the world: U.S. Steel bought Marathon Oil for \$6 billion; du Pont bought Conoco for \$7.5 billion; Standard Oil of California bought Gulf oil for \$13.5 billion; and Texaco bought Getty Oil for \$10 billion. After the oil takeovers, broadcasting was next, starting with Capital Cities Communications' acquisition of ABC for \$3.5 billion. Arthur Burck, the Florida consultant on mergers and takeovers, warns that, 'the creation of gargantuan corporations with awesome economic and political power poses a threat to our democratic institutions,' and 'it is likely that by the year 2000, several score multinational corporations will control most of the nation's industrial assets. By then, our industry could be a stagnant mess, dominated by many dinosaurs.'" (Wachtel, *The Money Mandarins*, p. 170.)

Oil Will Remain a Strategic Commodity in the New World Order

"With the end of the Cold War, a new world order is taking shape. Economic competition, regional struggles, and ethnic rivalries may replace ideology as the focus of international – and national – conflict, aided and abetted by the proliferation of modern weaponry. But whatever the evolution of this new international order, oil will remain the strategic commodity, critical to national strategies and international politics." (Dan Yergin, *The Prize: The Epic Quest for Oil, Money and Power*, New York, Simon and Schuster, 1991, p. 14.)

The Birth of Mega-Firms on the World Stage

"A new group of power-seekers are leaping onto the world stage and seizing sizable chunks of the clout once controlled by nations alone. Some are good; some, decidedly evil...."

"The liberalization of finance has encouraged the growth of some six hundred mega-firms which used to be called 'multinationals' and which now account for about one fifth of value added in agriculture and industrial production in the world. The term multinational, however is obsolete. Mega-firms are essentially non-

national. . . . (Alvin Toffler, *Power Shift*, New York: Bantam Books; 1991, pp. 450, 454.)

Proposals for New International Institutions

"Proposals are coming hot and fast for all sorts of new global institutions to deal with ecology, arms control, monetary matters, tourism, telecommunications, as well as regional economic concerns. But who should control these agencies? Nation-states alone...?" (Alvin Toffler, *Power Shift*, p. 456.)

Questions Facing the Architects of the New Global Order

"... A key question facing the architects of the new global order is whether power should flow vertically or horizontally.

"A clear example of vertical organization is the European Community, which seeks to build, in effect, a supra-government that would, according to its critics, reduce the present countries of Europe to the status of provinces rather than sovereign nations – by imposing supra-national controls over currency, central banking, educational standards, environment, agriculture, and even national budgets.

"This traditional vertical model seeks to solve problems by adding another echelon to the power hierarchy. It is 'high-rise' institutional architecture.

"The alternative model, congruent with the emerging forms of organization in the business world and the advanced economies, flattens the hierarchy rather than extending it upward. It will be based on networks of alliances, consortia, specialized regulatory agencies, to accomplish ends too large for any single state. In this system there is no higher level of top-down control, and specialized agencies are not grouped hierarchically under a nonspecialized central body. It is the equivalent of 'low-rise' architecture. It parallels the flex-firm.

"Around the world today, the EC is being closely watched and, very often, taken as the only model for regional organization. Thus, the proposal to clone the EC is loudly heard, from the Maghreb and the Middle East to the Caribbean and the Pacific. A more revolutionary approach would be to lace existing organizations in each of the regions together, without imposing a new layer of control. The same might be done between nations.

"Japan and the United States, for example, are so closely intertwined economically, politically, and militarily, that decisions in one have immediate high-impact consequences in the other. Under these circumstances, the day may arrive when Japan will demand actual voting seats inside the Congress of the United States. In return, the United States would no doubt demand equivalent

representation in the Japanese Diet. In this way would be born the first of many political 'cross-national' parliaments or legislatures.

"Democracy presupposes that those affected by a decision have a right to participate in making the decision. If this is so, then many nations should, in fact, have seats in the U. S. Congress, whose decisions have greater impact on their lives than the decisions of their own politicians.

"As the world goes global, and the new system for wealth creation spreads, demands for cross-national political participation – and even cross-national voting – will bubble up from the vast populations who now feel themselves excluded from the decisions that shape their lives.

"But whatever form the global organizations of tomorrow assume, they will have to pay more attention, both positive and negative, to the Global Gladiators.

"To what extent should groups like religions and global corporations, as well as transnational trade unions, political parties, environmental movements, human rights organizations, and other such entities from the civil society be represented in the institutions now being planned for the world of tomorrow...?" (Alvin Toffler, *Power Shift*, pp. 457-458.)

A Shift of Power from Nation-States to Global Corporations

"Only countries willing to opt out of the new system of wealth creation forever can avoid plugging into the new global economy. Those who do connect with the world will necessarily be drawn into an interdependent global system populated not by nations alone, but by newly powerful Global Gladiators [Multinational Corporations] as well.

"We are witnessing a significant shift of power from individual or groups of nation-states to the Global Gladiators. This amounts to nothing less than the next global revolution in political forms.... To assume that such changes will happen without civil war and other conflicts, or that they can be contained within the obsolete frame of a nation-based world order, is both shortsighted and unimaginative. The sole certainty is that tomorrow will surprise us all.

"What is brilliantly clear, then, is that as the new systems of wealth creation moves across the planet it upsets all our ideas about economic development in the so-called South, explodes socialism in the 'East,' throws allies into killer competition, and calls into being a new, dramatically different global order – diverse, and risk-filled, at once hopeful and terrifying.

"New knowledge has overturned the world we knew and shaken the pillars of power that held it in place. Surveying the wreckage, ready once more to create a

new civilization, we stand, all together now at Ground Zero." (Alvin Toffler, *Power Shift*, pp. 459-460.)

A New Order is Being Born

"... The old geopolitical order is passing from the scene and a new order is being born....

"In the next century, Japan and Europe may supplant the United States as the chief superpowers wrangling for global economic supremacy. Only a radical transformation of American society can forestall this development and its political consequences. From their privileged technological perches, they will preside over a world that has embraced a common ideology of consumerism but is bitterly divided between rich and poor, threatened by a warming and polluted atmosphere, girdled by a dense network of airport metropolises for travel, and wired for instant worldwide communication. Money, information, goods, and people will move around the world at dizzying speeds....

"Since about the thirteenth century, when what could be called a capitalist market order emerged, there have been a series of successive economic structures, or forms, around which society has tended to organize. Each has been based on a specific technology – usually a technology of communication, energy, or transportation. This technology, in turn, is the economic engine propelling supply and demand. Broadly speaking, there have been eight such forms since the 1300s.

"Because today we are entering into a new market form – the ninth – we need to understand what defines such a form.

"At the center of each form is a dominant city where the essential financial, technical, cultural, and ideological (but not necessarily political) power is concentrated. An elite typically controls the market – the prices and the products; the elite accumulates the profits, controls the salaries and the workers, finances artists and explorers. The elite defines the ideology that supports its power. Religious revolutions are often determining factors. The currency of the center dominates international exchanges. Artists come from everywhere to build palaces and tombs, to paint portraits and landscapes.

"Around this center is a milieu, or hinterland, comprising many countries or developed regions that buy the products of the center. Here you find ancient or future centers, the regions in decline or on the rise.

"Farther away is the periphery, still partially ruled by the order of force, which contains the exploited regions that sell their primary resources and their labor to the center and to the hinterland without ever having access to the wealth of the center....

"From the thirteenth century to the twentieth century, eight successive forms emerged, characterized by:

"Eight major technological innovations, the principal ones being the printing press, accounting methods, stern steering mechanisms, the flyboat, the caravel, the steam engine, the internal combustion motor, the electric motor....

"The essential question that must be answered is, Who decides which region or city will become a center?

"A city becomes a center when a constellation of industrial and political elites organize themselves around a cultural project and harness their resources to develop new technologies and faster means of communication. Because of their innovative temperament and technological inventiveness, they are better suited than any other group in the world at a certain historical moment to satisfy a perceived universal need with a product....

"The model of how world centers develop and decline helps us to understand the period of transition we are now entering. It offers particular insight into the efforts of the United States to stem its removal as the country that contains the center of the eighth market form and prevent the rise of its challengers in Europe and Japan who seek to establish themselves as the location of the new center of a triumphant ninth market form. . .

"Traditional notions of national sovereignty are increasingly irrelevant. The fax machine and the videocassette make it possible to pierce the veil of state censorship. Nevertheless, even if the world seems daily to be growing closer, more homogeneous in its cultural values and material aspirations, even if large corporations are establishing themselves in all countries, power remains in the hands of an elite. An elite, moreover, that resides in those few places where power and wealth accumulate, where the critical questions facing the planet are decided.

"The eighth market form, whose center is New York is rent by a severe crisis. It faces fierce competition. Other regions of the world desire to become the center of a new market form. It is, of course, too early to predict with certainty where the future center of the world-economy will be. But we can see already a new world struggling to be born, heralding a new age of development....

". . . For the past half century, the world order has been organized around what might be described as a pyramid and two pillars. The pyramid is the shape taken by the eighth market form of the order of money. At its summit is the United States, with all other nations arranged in descending and hierarchical fashion around the American peak. The dollar ruled international currency, American popular culture reigned supreme. This basic fact has been the starting point for all thought and theory about the modern political economy.

"The two pillars, vestiges of the order of force, have been the two principal nuclear powers – the United States and the Soviet Union – who imposed their views on their respective alliances and were arbiters of regional conflicts. This basic fact has been the starting point for all thought and theory about contemporary military strategy.

"Today, this structure is dissolving before our eyes: the pyramid is changing its summit; one of the pillars is crumbling. America's position as the peak is under severe strain; in Eastern Europe, the order of force is giving way to the order of money. These developments are profoundly changing the nature of global economic struggle and military conflict. Soon one will no longer be able to speak strictly of North-South, or East-West. The old Cold War categories no longer pertain.

"It would be foolhardy to believe that either the utter demise of the United States or the complete dissolution of the Soviet Union are irreversibly established. It is only certain that the new center, in the sense given to this world in the preceding chapter, will consolidate somewhere in the two dominant spheres – Europe or the Pacific rim – and that Eastern Europe will rejoin the market economy. For the rest, everything depends on the way the changes are managed....

". . . The United States may host the center once again, but this would require a Herculean effort of national will in order to effectively harness the country's assets. That effort, in the degree that is required, will be difficult. If America's economic decline hardens into reality, Europe will suffer. But, if Western Europe is able to link Eastern Europe with its development, an integrated Europe has a chance to assume the role of the center of the world economy. It will then be able to develop as the most populated, the richest, and the most creative center in the world.

"If not, the new center will likely be Japan, for the island nation combines the necessary conditions for attracting global monetary, industrial, and even cultural power....

"These two emerging contenders for the role of center of the ninth market form have embarked on a vigorous competition. The stakes are high, for they are nothing less than the economic and political mastery of the world. Neither has yet triumphed over the other. Inside each of these competing spheres, one can see a considerable growth in trade and merchandise, in people, in information; this interior growth is even more rapid than that of external trade. Each sphere forms a homogenous, closed group. In each, the principal economic power – Japan on one side, the European Community on the other – is moving ahead of the principal military power: the United States on one side, the Soviet Union on the other. A process of increased integration and intensified rivalry is shaping this evolution....

"A communications revolution has already taken place in the transfer of information: the telephone the fax, cables, and satellites, all allow the transmission

– at any moment, to any location in the world, at virtually the speed of light – of drawings, designs, and images vital for industrial production and for individual use. It is no accident that the Japanese are leaders in this area....

"Tokyo is already a major center of global finance: it is where much of the world's profits and financial instruments are concentrated....

". . . National borders are increasingly irrelevant. And yet globalism is by no means triumphant. Tribalism of all kinds flourish. Irredentism abounds. Cries for 'self-determination' mount in a world in which the very idea of sovereignty is made meaningless by the seemingly intractable planetary problems that now confront humanity....

". . . The coming world order will be fraught with danger: the ninth market form, no matter where its center is located, will replace living acts with dead artifacts; it will treat nature as merchandise and turn man himself into a mass-produced commodity....

"We will need to muster a new political vision and found new institutions that can compensate for the inherent limitations of the nation-state, and the constraining logic of the market. A vision of global stewardship will require, above all, political leaders who recognize the need for limits and have the courage to abandon traditional notions of national sovereignty. Such a course will doubtless face enormous obstacles....

"Never before have people held as much power to shape their future as they do today....

"... [T]he world will change more in the next ten years than in any other period of history....

". . . This much is clear: between now and the year 2000, the order of money will become universal. From Santiago to Beijing, from Johannesburg to Moscow, all economic systems will worship at the altar of the market. People everywhere will sacrifice for the gods of profit. Two economic spheres – competing, unstable, but increasingly homogeneous – will struggle for supremacy, one organized around the Pacific, the other around Europe. They will compete for minds, methods, and markets. In each of them, military prowess will give way to economic might. Democracy will generally hold sway....

". . . There are many obstacles to be overcome before the tendency toward economic union [EC] finds its political expression. But it will one day happen, if only because without progress in this direction all other gains will have been placed in jeopardy. For example, if the creation of a monetary union does not rapidly lead to the creation of a central bank, and to a common currency, the free circulation of men, of capital, and of goods will have been made untenable....

"The challenges pushing us most urgently are the related issues of demographic explosion, poverty and drugs, the threat to the environment, genetic manipulation, and arms proliferation. We are far from fully understanding the implications of these problems. Solving them will require leaders who are prepared to accept an unpopular abandonment of sovereignty....

". . . The institutions of the United Nations were not designed for this mission. They have neither the means nor the mandate. They must move to a higher level of international organization by becoming institutions with a truly supernational authority, a genuine planetary political power that can impose standards in the areas in which the survival of the human species is at stake.

"Few countries will easily accept such a transfer of power. I do not underestimate the difficulty of gaining the democratic adherence of such a scheme in a world of 7 or 8 billion people (with 5 billion below the level of survival). In its embryonic form, a regular summit meeting of heads of state representing the nations of the different continents may foreshadow such institutions and clarify some of the needed standards. If not, they will be imposed by committees of self-appointed experts or by obscure cabals.

"International authority and institutions seem indispensable in at least five crucial areas: malnutrition, toxic gases, genetic engineering, armaments, and drugs. Saving children from sickness and ignorance requires the establishment of international finance organizations that devise new forms of donations and aid. Saving the environment requires a world agency to assess damage already done, such as to the ozone layer, and to establish standards of maximum allowable pollution, to measure deviations from such standards, and to aid poor countries in gaining access to technologies that will curtail and eventually eliminate pollutants of all kinds. Protecting the human species requires the establishment of universal standards that will allow us to control medically aided procreation, prenatal diagnostics, and genetic imprinting...." (Jacques Attali, *Millennium – Winners and Losers in the Coming World Order*, New York: Times Books, 1991, pp.3-5, 24, 25, 27, 29, 31, 35-39, 48-49, 51, 117-121, 123-126.)

U.S. Dominates International Financial Institutions

"Until only a few years ago, the United States essentially ran the IMF, the World Bank, the GATT, the Coordinating Committee on Multilateral Export Controls (CoCom), NATO, and other nominally international agencies of hegemony, usually through foreign national surrogates. This meant that its preferred financial policies, as well as its geopolitical politics, were most likely to carry the day. (Robert Kuttner, *The End of Laissez-Faire – National Purpose and the Global Economy after the Cold War*, New York: Alfred A. Knopf, 1992, p. 15.)

Nations Should Cede Their Sovereignty to International Institutions

"In the late 1940s, the United States was reluctant to cede sovereignty to international institutions because it was so strong; empowering organizations controlled by foreigners seemed an affront. Today, there is resistance to a new round of institution building because America seems too weak. It is easier to cling to the habits of American economic hegemony, and the false ideal of laissez-faire, even as those illusions corrode America's own well-being.

"But to rebuild the world system and to redefine America's national strategy within that system requires the same boldness and imagination as possessed by the statesmen of 1944. First, we need to acknowledge the reality of pluralism. One hopes, contrary to Professor Kindleberger, that the role of hegemon can be played by a concert of great nations, for no single nation currently has the combined political and economic stature to do the job single-handedly. Such a system would require nations to pool sovereignty and financial authority in several functional areas: in an international trade organization with real enforcement powers; in a genuine global public central bank or regional banks with a Keynesian bias toward high growth. (Robert Kuttner, *The End of Laissez-Faire – National Purpose and the Global Economy after the Cold War*, p. 23.)

Development of a European Central Bank

"The more venturesome European federalists have long argued that the EMS needs to evolve into a true European central bank with a single circulating currency. This idea of a common European currency, once proposed by Jean Monnet and seconded repeatedly by Robert Triffin, got an important practical boost at the Strasbourg European summit meeting in December 1989 when Jacques Delors's design for a European central bank and common currency, to be gradually phased in over more than a decade, was accepted. The idea is to create a central bank roughly modeled on the U.S. Federal Reserve, called 'Euro-fed'; then to establish permanent fixed parities, which would operate for a while in parallel with the ECU; and finally to convert all national currencies to the ECU. Several obstacles remain, of course, including Britain's nonmembership in the EMS, as well as Germany's awkward divided loyalties between the imperatives of European union on the one hand and the completion of German economic unification on the other. Yet at Strasbourg, the French insisted that progress on the money question would be the test of Germany's continuing good faith as an active European power, and in the end Germany embraced the French position. The French, in turn, implicitly accepted that the dominance of the Bundesbank pulls the rest of Europe toward a German-style macroeconomics – low inflation, slow but steady growth, and monetary discipline. At the same time, the more that the DM or the successor ECU comes to be used as a global currency, the greater is the risk of imported inflation. (Robert Kuttner, *The End of Laissez-Faire – National Purpose and the Global Economy after the Cold War*, p. 236.)

Development of a World Central Bank

"It is very likely that within a decade or so the preconditions could exist for a global monetary system...based on a few key currencies, in this case the dollar, the yen, and the mark or ECU. Yet evolution in this direction is complicated by several factors. One is the American reluctance to give up the perquisites of dollar domination; the other is the divided responsibilities of the new Germany. Thus far, German policy has given priority first to domestic monetary stability of the enlarged deutsche mark area, second to stability within the EMS, and only third to its still limited role as one of the global money managers. For the next several years, Germany will have its hands full reconciling its absorption of the former German Democratic Republic with its continental role as monetary hegemon for the EC. However, as European integration proceeds, the EC will increasingly become a single unit with economic and monetary strength equal to or greater than the United States.

"The EMS is sometimes held up as a model of an embryonic global central banking system, not unlike Keynes's original conception of a currency union. But if there are political obstacles to the creation of a single central bank and currency within Western Europe, which for forty years has been gradually moving toward political federation and economic union, there are obviously profound obstacles to the creation of a global central bank, the fourth alternative. A worldwide central bank modeled on the Federal Reserve would require nations to give up a significant degree of sovereignty in their monetary policies and hence substantial political sovereignty as well. In practice, a regime of more or less free trade has this effect in any event. If a nation has an irresponsibly inflationary monetary policy, its currency loses value and it suffers a balance-of-payments crisis. From a conservative perspective, this form of discipline has the virtue of seeming "objective" rather than deliberate. It is one thing to yield sovereignty, discreetly, to global market forces. It is quite something else to yield it to an explicit political institution or federation, which might have policies counterbalancing market imperatives. This was, of course, Keynes's insight at Bretton Woods. The world's financial markets would be unlikely to look kindly on a politically accountable genuine world central bank.

"Moreover, a world central bank would require far greater power-sharing between rich and poor nations. Under the present system, the world's smaller and less developed countries are subject to deliberate and explicit constraints under the aegis of the IMF and the World Bank. A generation of IMF "stabilization" programs has imposed austerity remedies on developing nations that wish to be certified as sound candidates for investment. The United States, one of the macroeconomic malefactors, has never been subject to the discipline of an IMF stabilization program. That would be an unthinkable affront, no matter how irresponsible the U.S. deficit. As the Romans said, *quod licet Jovi non licet bovi*: what is permitted the gods is not allowed to cattle. For the most part, it is the

world's smaller and poorer nations that have had to submit to the economic pain and political indignity of carrying out IMF-imposed "stabilization" schemes. When Britain had to succumb to an IMF plan in the mid-1970s, nothing could have been a surer signal that it had fallen from the ranks of the world's financial great powers.

"Any plan for a world central bank would founder on the same rock that wrecked the Keynes-White concept of the original IMF – a refusal by the great powers, particularly the United States, to cede sovereignty. Still, it is imaginable that within a decade or two the financial system will be something of a hybrid – a system based on three key currencies with a strengthened global bank. Politically, it will come clear by the year 2000 that the dollar is no longer hegemonic, especially if Europe continues its progress toward monetary union. Japan is already a significantly greater financial power than we, and Europe will soon pass the United States in gross national product. Japan and Europe are also net creditors, which the United States is not.

"When the United States is no longer dominant financially and the dollar gradually gives ground to the yen and the DM/ECU as a reserve and transaction currency, the U.S. will no longer be able to cling to the idea that it actually exercises hegemony. Monetary sovereignty with two other major powers would already be shared, and there would be no reason to resist sharing it with a global central bank as well. (Robert Kuttner, *The End of Laissez-Faire – National Purpose and the Global Economy after the Cold War*, pp. 237-238.)

The IMF Has Been Captured by International Bankers

"The role of the IMF as agent of austerity, orthodoxy, and private capital is an odd mutation from what was intended by Keynes. Far from being a counterweight to the 'bankers' internationalism' of the 1920s, the IMF has been thoroughly captured by private commercial banks and inflation-wary central banks, and its credit agreements are loaded with various forms of 'conditionality' imposed on struggling economies. There is an extensive and bitter literature from Third World experts on how IMF stabilizations have crushed struggling economies in order to save them. (Robert Kuttner, *The End of Laissez-Faire – National Purpose and the Global Economy after the Cold War*, p. 254.)

Ceding Sovereignty to a Global Central Bank with Power to Create Currency

"As we look forward to the twenty-first century, we must ask: What currency or currencies will function as the world's money, and subject to what blend of austerity and expansion as the strategy of adjustment and stabilization? What philosophy and what institutions will we have for the economic development of poorer nations – and the transition to market economies in the failed communist regimes? Will global banks like the IMF and the World Bank be engines of laissez-faire or sympathetic to mixed economies? How shall we reconcile systemic needs of world economic growth with the parochial interests of great powers and their

multinational firms and banks? As in 1944, the essential choice is whether to leave these questions to the tender mercies of markets and private economic forces or to balance markets with public institutions ultimately accountable to voters....

"A better alternative would be closer to Keynes's vision in 1944: a supranational institution very much like a world central bank with the power to create reserves that would become a substantial portion of the official reserves of most nations. The IMF has been only a most tepid version of this sort of institution. IMF Special Drawing Rights account for only 3 percent of world reserves today, less than in 1970, and the United States has generally resisted expanding them significantly. Keynes's proposed clearing union was user-friendly, allowing nations freely to draw on a line of credit up to a preset limit. The modern IMF is more like a debtors' prison and should be restored to its original vision.

"A true world central bank would require the ceding of a substantial degree of monetary sovereignty, which in turn would mean giving up a good deal of policymaking sovereignty as well. Ironically, of course, the incursion of the global "free market" upon the policymaking capacity of states has precisely this result in any event. As a matter of ideology and nationalism, it is no concession at all for conservatives to let global market forces and private capital gradually assume perquisites that once belonged to sovereign states. It is something else entirely to recognize what is taking place and to make a conscious decision to pool sovereignty the better to counterbalance market forces and private capital.

"A good deal of de facto sovereignty has already been ceded to markets. To the extent that sovereignty has been pooled..., it has been entrusted to perhaps the most conservative and market-oriented of all public institutions – central banks. Central bankers have an almost fanatical devotion to sound money, a fear of inflation, and an insistence that debts be paid. So although a regime of public and supranational institutions is in operation, the triad of central bankers, IMF, and World Bank has been so thoroughly creditor-oriented that it might as well have been the House of Rothschild or the House of Morgan..." (Robert Kuttner, *The End of Laissez-Faire – National Purpose and the Global Economy after the Cold War*, pp. 258-259, 260-261.)

Global Financial Integration and the End of Sovereignty

"The debate over European union reveals many examples of efforts to defend geography – or what in this context is often termed 'sovereignty' – despite the diminished sovereignty of nations in an integrated world economy....

"The erosion of sectorial barriers suggests that the world is moving towards German-style universal banking, but this conclusion is likely to mislead if that is to suggest that the German system will prevail in its entirety. German universality has two distinct characteristics: close ownership links between commerce and banks, and universality in terms of what a bank can do....

"A recent appraisal of the process of economic integration world wide reached the following broad conclusions ...: first, integration in the broader economic area is happening ... second, integration in finance is progressing at a faster pace than in other areas; and third, central to the pace of change is whether governments and people find such changes 'acceptable' – which in the context of this study translates as, are the public and private sectors of our economies ready for the end of geography....? [Sovereignty]

"It would seem too early to talk of a global currency; indeed, to envisage it today would probably bring the end-of-geography story into disrepute....

"There are two hopeful signs. First, the fungible nature of money does allow finance to flow more easily across borders.... Second, the shift from the nation-state to the trade bloc, despite the risks, is being driven in part by end-of-geography forces. This conclusion rests on the assumption that the expansion of organizations from the national to the regional stage is a precursor of the movement from the regional to a more global stage. Europe is integration on a regional basis because the separation into individual nations no longer makes sense. Of course, there is a strong effort to rebuild the national powerhouse at the regional level, which in the extreme could mean Fortress Europe....

"A more sober look at the crystal ball suggests a rather bumpy road toward seamlessness [end of sovereignty]: intense competition among financial firms, with major bankruptcies, forced mergers followed by massive shakeouts, crisis for customers and producers alike, repeated losses from overambitious investment in new technologies, financial crisis leading to the socialization of losses (a la S&Ls) and seemingly intractable problems in reconciling the fundamental differences between contrasting financial systems.

"Emerging from this discouraging scenario may be a reaction against end-of-geography [sovereignty] trends on two counts: policymakers could be increasingly called upon to protect not only the national interest but also that of the consumer Such a protectionist reaction against the end -of-geography suggests a nightmare prospect....

"The end of geography is, in many respects, all about the end or diminution of sovereignty. We are unlikely to witness governments presiding, actively and willingly, over their own demise....

"There is also a key difference between the public policymaker and the market participants in their respective attitudes to the end of geography. The [multinational] firm is far less wedded to the idea of geography. Ownership is more and more international and global, divorced from national definitions. Investors and borrowers think in international and global terms....

"Kenichi Ohmae (1990), in his 'borderless world,' hopes that 'government leaders will recognize that their role is to provide a steady and small hand, not to interfere....' But, as firms, regulators and marketplaces compete on the 1990s, it will be very hard for governments to avoid intervening to protect the consumer and the system. The consumer and the financial firms are likely to be the worst offenders in calling on governments to intervene when it suits, and to keep out at other times. It will be tempting to take a nationalistic, populist line as it tries to determine where its priorities lie, especially when the very power of government, vis-a-vis other governments, is threatened. The siren calls put out by national champions, whether firms or markets should be ignored...." (Richard O'Brien, Chief Economist, American Express Bank, *Global Financial Integration: The End of Geography*, London: Royal Institute of International Affairs, 1992, pp. 2, 5, 26, 83, 86, 90-91, 99, 100.)

The End of National Sovereignty

"The world is now tied together by an electronic network that carries news and data, good and bad, true or false, with the speed of light anywhere on this planet....

"The information technology...is rapidly creating a situation that might be described as the twilight of sovereignty, since the absolute power of the state to act alone both internally against its own citizens and externally against other nation's affairs is rapidly being attenuated....

"The information revolution is profoundly threatening the power structures of the world, and with good reason. The nature and powers of the sovereign state are being altered and even compromised in fundamental ways. The geopolitical map of the world is being redrawn....

"Sovereignty, defined by the Dictionary of International Law as 'the supreme undivided authority possessed by a state to enact and enforce its law with respect to all persons, property, and events within its borders,' is one of the most important ordering ideas of the modern world, a bulwark of modern power structures. Yet it is a relatively recent idea, first given to us in full-bodied form by the great Dutch jurist Hugo Grotius in his seminal work *DeJuro Belli et Pacis* (concerning the Law of War and Peace), in 1625. It is possible to imagine a world in which state sovereignty as we know it did not exist or existed in substantially altered form.

"As the dictionary definition implies, sovereignty has always been, in part, based on the idea of territoriality. The extent of a sovereign's reach has usually been defined by geographic borders....

"The velocity of change in economics, technology, science, and military capabilities is shifting the tectonic plates of national sovereignty and power.

"Our tractional aspect of sovereignty has been the power of nation-states to issue currency and mandate its value.... As the information revolution has rendered borders porous to huge volumes of high-spied information, it has deprived them of that power....

"Our tractional aspect of sovereignty has been the power of nation-states to issue currency and mandate its value.... As the information revolution has rendered borders porous to huge volumes of high-spied information it has deprived them of that power....

"The entire globe is now tied together in a single electronic market moving at the speed of light....

"The world can no longer be understood as a collection of national economies. The electronic infrastructure that now ties the world together; as well as great advances in the efficiency of conventional transportation, are creating a single global economy....

"On the global business front, the new word is 'alliances.' Almost everyday one reads about an American company and a Japanese company or a Swedish company and a German company – the list of combinations is endless – forming an alliance to offer a new product in a multinational horizontal integration of manufacturing, marketing, finance, and research. As these alliances grow and strengthen over time, it will become harder and harder for politicians to unscramble the emerging global economy and reassert their declining power to regulate national life....

"The old political boundaries of nation-states are being made obsolete by an alliance of commerce and technology. Political borders, long the cause of wars, are becoming porous....

"Satellites have made borders utterly porous to information....

"The new source of wealth is not material; it is information, knowledge applied to work to create value. The pursuit of wealth is now largely the pursuit of information and the application of intellectual capital to the means of production....

"When the world's most precious resource is immaterial, the economic doctrines, social structures, and political systems that evolved in a world devoted to the service of matter became rapidly ill suited to cope with the new situation....

"The emergence of information as the preeminent form of capital reverses this drift toward centralizing power. The nation-state will not disappear; indeed, we will see many new nations formed. Nor will sovereignty vanish either as an idea or as an institution. But the power of the state will diminish, particularly its sovereign power....

"A truly global economy...will require concessions of national power and compromises of national sovereignty that seemed impossible a few years ago and which even now we can but partly imagine. Such an economy cannot be readily contained or controlled by mercantilist or protectionist strategies. The attempts of sovereign states to cut off an control little bits of the world market for their own advantage will be more obviously futile than ever in the past....

"...The world communications infrastructure...has made a reality of Marshall McLuhan's global village by drawing nearly all the world into a single global conversation....

"This market, of billions of plugged in 'culture traders,' is now the most powerful social and political force in the world....

"The global network is the essential infrastructure of that economy, and it promises to make its users into a single worldwide community sharing many tastes and opinions, styles of dress, forms of government, and modes of thought. These people, on the whole, will be internationalists in their outlook and will approve and encourage the worldwide erosion of traditional sovereignty. They will feel more affinity to their fellow global conversationalists than to those of their countrymen....

"In the world we are building today it is almost impossible to assert sovereignty over information because information and the pathways over which it travels, including the heavens themselves, are shared in common....

"The control of information is the bedrock of all totalitarian regimes....

"A traditional aspect of sovereignty has been the power to issue currency and to control its value....

"Technology has made us a 'global' community in the literal sense of the word. Whether we are ready or not, mankind now has a completely integrated, international financial and information marketplace capable of moving money and ideas to any place on this planet in minutes....

"The power of sovereign states to control commerce between its citizens and the citizens of other nations has been a jealously guarded right as long as nation-states have existed....

"The most remarkable example of economic integration, on a regional basis, is the rapid progress made by the EEC toward turning Europe into a single market....

"Clearly, a common currency will be the final step in a completely integrated market, and the EEC has moved toward this eventuality, but this surrender of

sovereignty touches the very heart of the nation-state. To lose control of the right to issue currency is an attack upon one of sovereignty's most valued rights....

"The single market comes at a real cost in traditional power and sovereign prerogatives: Brussels, where the European Commission and the European Parliament are located, now entertains more lobbyists than any city in the world other than Washington [D.C.], testimony to how much power has shifted toward this transovereign body....

"All of this has profound effects upon the ancient concept of sovereignty. The sanctity of national borders is an artifact of another age....

"Borders are no longer boundaries, technology has made them porous...." (Walter B. Wriston, Former Chairman, Citicorp, *The Twilight of Sovereignty*, New York, Charles Scribner's Sons, 1992, pp. xi, xii, 2,7, 8-9, 11-12, 19, 34-35, 37,44-45, 46-47, 52, 56, 61, 77, 87-88, 89-90.)

Technology Is Concentrating Wealth and Power

"While relatively cheap technology has made information accessible, the cost of obtaining that information is usually rather steep. As a result, though information is produced plentifully, its effect has so far been to concentrate wealth and power even more." (Joel Kurtzman, *The Death of Money*, New York, Little, Brown & Co., 1993, p. 48.)

The U.S. Assumed the Role of the World's Financial Manager and Global Policeman at a Cost of \$7 Trillion Dollars

"Before Mr. Nixon worked his magic [closing the gold window on August 15, 1971], the world economy was governed by what were called the Bretton Woods Agreements, named after the town of Bretton Woods, New Hampshire, where the agreements were negotiated and signed on July 22, 1944. The main feature of the Bretton Woods system was that all of the world's major trading currencies were rigidly linked to the dollar in a system of fixed-exchange rates. The dollar, at the center of the system, had its value anchored firmly to gold. The Treasury Department was obligated by law to redeem foreign held dollars for gold at the official rate of \$35 an ounce. The gold window was where those dollars were redeemed.

"Because the dollar was convertible to gold and all other currencies were convertible to dollars at fixed rates, the world was effectively on the gold standard, even though no one publicly said so. Countries could expand their money supplies only if they could maintain the value of their currencies against the gold-based dollar. Effectively, that meant the world's money supply expanded at about the same rate of growth. Dollars, francs, pounds, and fire were produced, roughly, as they were needed for the orderly expansion of growth and trade. The real economy

and the money economy expanded and contracted together. They were balanced on a fulcrum of gold....

"But there was a problem with the Bretton Woods postwar system that ultimately led to its ruin and to Nixon's abandonment of its rules. The problem was this: The Bretton Woods system demanded too much from its leader, the United States. It demanded not only that the United States assume the role of the world's financial manager but also that it be the world's policeman. The role of global policeman was simply too much for one nation to bear, even one as wealthy, productive, and powerful as post-World War II America. It was also expensive beyond belief.

"American taxpayers might send their sons to war, but they resented sending their money to Washington to pay for those wars. As a consequence, American politicians maintained the world order not through taxation but by borrowing or simply printing money....

"What were the costs of being the world's policeman? Almost \$7 trillion during the Bretton Woods period, according to Melman. Much of that \$7 trillion was paid for simply by running the printing presses. (Two trillion dollars of this debt remains outstanding.) What is this immense expenditure equal to in human terms? From the end of World War II until Nixon's resignation in 1973, the 'military consumed sufficient resources to more than rebuild everything in the United States that is man-made,' said Melman. 'That means that the entire industrial infrastructure of the United States could have been rebuilt from the ground up. All the factories, roads, airports, ports, bridges, everything existing today could have been made anew. Imagine the effect this would have had on our nation's competitiveness.'" (Joel Kurtzman, *The Death of Money*, pp. 52-53, 54-55, 58-59.)

The Trend Toward the Global Economy

"The changes we are witnessing today did not simply arrive fully formed. They are part of a wrenching, longer-term shift away from the nation-state and toward the world-as-a-whole as the fundamental unit of economic activity. This trend, which is fraught with contradictions, filled with competing interests, and plagued by setbacks, is nevertheless moving ahead. And short of nuclear war, nuclear accident, plague, or a massive chemical spill, it will continue to move ahead at an increasingly rapid pace." (Joel Kurtzman, *The Death of Money*, pp. 206.)

The Concept of National Sovereignty Must Change

"For the average man or woman the emergence of such a tightly linked global economy has been invisible. These changes move like the hands of a clock, too slow to see if looked at directly but unrelenting in their pace when viewed intermittently over time. But they also move at the speed of light – the speed of the electron – too fast to see even if viewed straight-on.

"As a consequence the world we now inhabit is markedly different from the world of a decade or two ago. The jobs we hold, the way we work, the companies that employ us, and the sectors in which our country excels have changed. In the span of a decade or two a host of old and comfortable patterns have been completely dislodged. As the functional economic unit becomes the world instead of the nation-state, the structure of nations and the notion of sovereignty must change. 'My notion is, said Jib Fowles, 'that the world is beginning to resemble one gigantic hive.' (Joel Kurtzman, *The Death of Money*, p 214-215.)

Rebellion Over Loss of National Sovereignty

"...Countries connected to the global electronic economy, like the millions of computers connected to a network, are becoming part of the vast and highly integrated global workshop and economy. But as they do, their citizens rebel against the inevitable loss of identity and national sovereignty. Men and women around the world chafe at becoming just another interchangeable part of the new world economy – an accounting 'input,' a unit of labor. As a result, a new 'tribalism' has emerged. From the ex-Soviet Union to Bosnia and Canada, people are demanding the right to express their ethnic identities.

"No one really likes to be a cog in the international economic and business machine. People do not want to be factored into the global equation as a depository of raw materials (the Middle East, Mexico, and Canada), a market or a pool of industrial and production talent (Europe, Japan, and the United States), a place to locate a research lab (Switzerland and Israel), or a future market (the ex-Soviet Union and the Third World). Communities around the world that are linked electronically to this newly integrated world system are increasingly uncomfortable with their loss of control over their own destinies as they integrate into the global workshop." (Joel Kurtzman, *The Death of Money*, pp. 215-216.)

The Demise of the Nation-State and National Sovereignty

"Marshall McLuhan, the late Canadian social scientist, was one of the first to observe how these two competing economic influences – globalization and the uneasiness that comes from the loss of local and national control – would manifest themselves. Along with the globalization of the economy, McLuhan said, comes a countervailing trend toward parochialism, localism, nationalism, chauvinism, ethnocentrism, fundamentalism, and racism.

"McLuhan said that globalism, telecommunications, air travel, the modern media, and computers were changing the way we analyze problems, organize companies, structure countries, value one another, and even use our five senses. Indeed, McLuhan's Canada is a good example of the dichotomies that are developing between the global economy and the local community. For example, the Canadian government had relatively little trouble signing a free-trade agreement with the United States that would deprive Canada of many of its most

cherished national rights when it comes to trade and the economy. The Canadian federal government, the provincial governments, and its labor unions and political parties supported Canada's further integration into the American economy and the world economy. Free access to American capital, markets, and technology were powerful inducements to Canada's business community even though it meant that their home government could no longer protect them. For these companies the risks were clearly worth it.

"But when it came to the purely local and largely symbolic issue of the Meech Lake Accords, which would give French-speaking Quebec more autonomy and the French language more clout while keeping Canada a single country, the country's leaders balked. Outside of Quebec, Canada's English language chauvinism and anti-French feelings have become even more intense as Canada joins the global economy. Provincialism and ethnocentrism are on the rise in Canada as globalism looms overhead.

"This 'up-and-down trend,' as the *Economist* newspaper once put it, is happening worldwide. In countries everywhere the two trends compete: integration into the global grid, on the one hand; greater local identification, on the other. Could it be, asks the *Economist*, that it is time to say 'goodbye to the nation-state'?

"McLuhan predicted that there would be an increase in ethnic identification accompanying globalization. As a consequence, ethnic and linguistic rivalries within Canada may eventually force the country to dissolve as a nation-state, just as it becomes even more integrated into the global grid. As a fragmented entity with a diminished economy, Canada's global clout and bargaining power would only be lessened. The ability of its separate ethnic communities to survive independently would be in doubt. Canada would thereby join the international economy not as the nation it once was, occupying a huge portion of the world's geography, but as a cluster of companies, communities, talents, and resources linked electronically and structurally to other such entities around the world and with its laws harmonized with those of the United States through the free-trade agreement.

"Such a state, however, is abstract, vague, and ethereal. A cluster of productive interests is not much for its citizens to identify with. It is hard to sing a national hymn or sacrifice one's life to the multinational economic interests that support you. It is hard to be loyal to the economic band that supports you when it is controlled by people at various points around the world.

"In a world where the functional unit is the globe, people tend to identify more deeply with their own races, religions, cultures, neighborhoods, villages, towns, and cities than with the planetary economy as a whole. If for some reason they fail to identify with their own localities and ethnic identities, then they are lost to the

loneliness of alienation, a term Karl Marx coined in his critique of capitalism over a century ago.

"This, then, is an emerging pattern. On the big issue of joining the new world system, no country remains opposed for very long. Britain, France, and Italy gave up a great deal of their economic and political sovereignty to join the European Community, which is dominated by their ancient enemy, a unified Germany. Canada gladly gave up its sovereign rights and joined the United States in a free-trade agreement. Mexico, which has made anti-Americanism into a quasi-state religion, allowed its president, Carlos Salinas de Gortari, to come to Washington with a plan to link the two economies legally, with very little protest from his constituents at home. Every nation in the Western community of nations, seeing the big picture, went along with barely a whisper of discontent and official discord. But on the local issues of race, ethnicity, and local control over local institutions, they stand firm.

"The big trade treaties and agreements, and the ones that will be arrived at in the future that will include the newly liberated countries of Eastern Europe and the Soviet Union, represent nothing less than the demise of the old nation-state system and the rise of an entirely new form of shared sovereignty. It is a new world that is organized along networked lines.

"A high price is to be paid for the demise of the nation-state. 'What we are seeing now,' said Benjamin Weiner, a former foreign service officer who is president of Probe International, a firm that advises businesses and governments on political risks around the world, 'is the growth of ethnic rivalries. Ethnic rivalries are replacing politically motivated terrorism as the biggest threat to business. We are seeing it in every region of the world' including the Soviet Union, Africa, Canada, Yugoslavia, and, Weiner added, the United States. (Joel Kurtzman, *The Death of Money*, pp. 216-218.)

The End of the Nation-State

"The electronic economy will only intensify this trend toward localism, particularism, provincialism, nationalism, and racism among people whose lives and identities are disrupted by the end of the nation-state. In a worst-case scenario, right-wing Nazi-like movements will develop throughout the world as countries lose power and control and as the average man and woman feels more threatened by a global economy that is increasingly abstract and remote.

"In the worst-case scenario, religious intolerance will also increase, and fundamentalism – in all its guises and in all its different religious forms – will increase as the average man and woman grope for something big and powerful to cling to. Fundamentalism will increase as people's lives are made to seem insignificant by the creation of a single, massive, global economy whose

enterprises are loyal to no one, bigger than everyone, and under no one nation's control.

"Even in the best-case scenario, the forces of nationalism will grow as Americans want to be more American, Germans more German, and the French more French. Within each of these countries, each region will also assert itself – Southern culture, Western culture, Northern and Eastern culture-as the notion of the nation-state gives way." (Joel Kurtzman, *The Death of Money*, pp. 224-225.)

Former Soviet Union and China Will Join the International System

"Marshall McLuhan saw the deep tension between decentralization and globalization as the essential – but largely invisible – dichotomy of our electronic age. These two forces, precipitated by the rise of satellites, global electronics, and the ease of jet travel, would alter all our institutions, change our society, and create a new economy, he said.

"The first victim of these changes would be the old forms of corporate hierarchy and rigidly centralized government. The old notion of an infallible chief executive at the top of an obedient chain of command, protected by (and from) his troops, could not survive the information age. That old structure would be unable to compete in an electronic world where information is disseminated at the speed of light and where notions of up, down, near, and far have no meaning.

"McLuhan also predicted that sharply hierarchical organizations would be replaced by flatter structures where telecommunications technology linked all parts of the company into a more organically functioning whole. Like others over the years, he predicted that each operating unit would have to have more autonomy and flexibility in order to compete and survive in the new global environment.

"In the new electronically linked world, McLuhan predicted management would change from a hierarchy to a 'widearchy,' with lateral links, like alliances, and who sits on whose board of directors often would be more important than ownership links. Indeed, Japan's companies, through their Keiretsu system, are networked together in tightly linked business groups, often with minimal cross-ownership but maximum cross-control. A number of American companies, such as IBM, Ford, and Boeing, are said to be developing their own Keiretsus.

"The second victim of the dichotomy between the forces of economic globalization and decentralization, McLuhan shrewdly predicted, would be communism. Almost three decades ago McLuhan wrote that communism was on the verge of extinction. The Soviet model, he said, with its highly centralized command economy, guarded information, and hierarchies taller than the Kremlin's onion domes, was out of phase with the new global electronic reality.

"In 1968, he wrote, 'Communism is something that lies more than a century behind us, and we are deep into the new age of tribal involvement.' By tribal, McLuhan meant ethnic. Even in the 1960s McLuhan was able to divine that Marxism could not survive. But it took until 1991, when the Soviet Union met its demise – to be replaced by a commonwealth of ethnic republics – for McLuhan to be proved correct.

"These captive republics became free of Moscow not just because they stood up to the power of the Kremlin but also because the Kremlin – like all highly centralized governments – was an outmoded institution. As the Russian republic rises from its ruins, it will strive to join the megabyte economy, employ its workers in the global workshop, and conduct its affairs openly in the global economy, no differently from any other country. The Russians know that if they choose to remain isolated from the rest of the world, they will fall further behind. No country and no people cut off from the world's fertile flow of information can maintain economic power for very long. In the electronic world, Moscow is no nearer to Kiev than it is to Los Angeles or Lima, Peru.

"And China is no different. The era when a centralized bureaucracy could control a population and an economy as vast and complicated as China's has passed. Two hundred and fifty million households with access to vital information in underground newspapers are taken directly from the airwaves, through international radio broadcasts, off satellites, from voice and videotape cassettes smuggled into the country – and all spread rapidly over telephone lines and through face-to-face gossip of friends – cannot be controlled by a few hundred people in the top echelons of the Communist party.

"For China to enter the modern age and grow, it has no choice but to decentralize its control over its population and its economy, and join the international system. (Joel Kurtzman, *The Death of Money*, pp. 224-225.)

The Need for Corporate Socialism and Management of the Economy

"The market must be managed and regulated.... It must be planned....

"The countries that have done the best over the last decade or two are those with the most egalitarian distribution of wealth and with governments that regulate the market and plan. By American standards, Japan's income and wealth distribution are so equal, they are downright communist....

"...We need policymakers who realize that while America has been caught in stasis, Europe and Japan have grown and even surpassed it.

"The market has many, but not all, of the answers. It is time for our policymakers to temper their faith in the market with an assessment of what we have received in return. They must realize that today's short-term mentality is a

response to volatility. Our policymakers must reexamine the successes of the European nations and Japan and recognize that, in the world's fastest-growing and most successful countries, the invisible hand of the market has always had a measure of help from the very visible hands of government. We Americans deserve no less." (Joel Kurtzman, *The Death of Money*, pp. 230, 231, 240-241.)

Margaret Thatcher Loses Her Position as Prime Minister Over the Issue of European Integration

"In the spring of 1991 British prime minister Margaret Thatcher lost her job. She had not lost an election. It was not obvious that she would. She lost her job because she insisted on playing the old twentieth-century economic game. She simply would not recognize that the world had changed and that she would have to change with it. She would not play the twenty-first century's economic game. Having lost touch with reality, she had to be pushed aside by those who were previously her allies.

"Her downfall arose over the issue of European integration. Her stated purpose was to preserve the powers of the Bank of England to control money supplies and set British interest rates. She saw losing these powers as 'the greatest abdication of national and parliamentary sovereignty in our history.' She did not understand that these economic powers were no longer within her national political power. In the new world economy what Mrs. Thatcher wanted to do could not be done – even though it had always been done in the past.

"As of January 1, 1993, any European bank will be able to place an office in any other European city without government permission. When this happens, everyone will borrow in the country where interest rates were lowest and lend in the country where interest rates were highest – making interest rates the same everywhere in Europe. Mrs. Thatcher's only real choice was to join the European Monetary System (EMS) and have the power to appoint some of the members of a new European central bank, or refuse to do so and watch the German Bundesbank, in the absence of any British votes, gradually become the effective central bank for Europe. To retain any economic power over interest rates for the United Kingdom, she had to participate.

"If England did not stay in the Community and did not join the EMS, the financial capital of Europe would move from London to Frankfurt. Finance, Britain's most important industry, would almost certainly be lost. Even with England's full participation in the European Community (EC), with Germany as Europe's leading economic power, it is going to be difficult to keep Europe's financial capital in London. The City of London simply cannot afford the handicap of being outside the European Monetary Union. As a result, a conservative financial community had to dump a conservative prime minister.

"In the end Mrs. Thatcher lost her job because she could not come to grips with the new economic realities. She didn't like European integration, but she could neither leave the European Community (Britain could not prosper without being a member) nor stop its further integration (if necessary, the other members would integrate without Britain)...." (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, New York: Warner Books, Inc., 1993, pp. 27-28.)

A World Economic War is Raging

"Looking backward, future historians will see the twentieth century as a century of niche competition and the twenty-first century as a century of head-to-head competition. In 1950 the United States had a per capita GNP four times that of West Germany and fifteen times that of Japan. What were high-wage products from the Japanese perspective were low-wage products in West Germany. What were high-wage products in West Germany were low-wage products in America. As a result, imports from West Germany or Japan were not seen as threatening the good jobs that Americans wanted. Conversely, America's exports did not threaten good jobs in West Germany or Japan. The United States exported agricultural products that they could not grow, raw materials that they did not have, and high-tech products, such as civilian jet airlines, that they could not build.

"The 1990s start from a very different place. In broad terms there are now three relatively equal contenders – Japan; the European Community, centered around its most powerful country, Germany; and the United States. Measured in terms of external purchasing power (how much can be bought if one's income is spent abroad), the per capita GNPs of Japan and Germany are slightly larger than that of the United States. The exact amount depends upon the precise value of the dollar, mark, and yen when the measurements are made. Measured in terms of internal purchasing power (how much can be bought if one's income is spent at home), America's per capita GNP is higher than that of West Germany or Japan. The precise amount depends upon whether the measurements include social services (the Germans get many more than Americans) and leisure (in Germany scheduled hours of annual work are about 10 percent less than that in America, Germans are absent from work ten days more per year, and many fewer German women are in the paid labor force), or only private goods and services.

"Consumer standards of living are one aspect of success, but production abilities are another. Depending upon the industry under consideration, leadership can now be found in Germany, Japan, and the United States. The United States no longer leads in everything. In some areas, such as automobiles, it is a follower, and in others, such as consumer electronics, it is not even a player.

"Where American firms used to dwarf their competitors, they now find themselves increasingly on the small side. In 1970, 64 of the world's 100 largest

industrial corporations were found in the United States, 26 were found in Europe, and only 8 in Japan. By 1988 only 42 of the 100 largest were located in the United States, 33 were located in Europe, and 15 were located in Japan. In the chemical industry the three biggest firms are all found in Germany. Each is at least one third bigger than Du Pont – America's largest chemical company. Outside manufacturing, the same trends exist. In 1970, 19 of the world's 50 largest banks were North American, 16 were European, and 11 were Japanese. By 1988 only 5 were North American, 17 were European, and 24 were Japanese. In 1990 there were no American banks in the top 20. In the service sector 9 of the 10 largest firms are now Japanese.

"But starting from approximately the same level of economic development, each country or region now wants exactly the same industries to insure that its citizens have the highest standards of living in the twenty-first century. Ask Japan, Germany, and the United States to name those industries that they think are necessary to give their citizens a world-class standard of living in the first half of the twenty-first century, and they will return remarkably similar lists – microelectronics, biotechnology, the new materials-science industries, telecommunications, civilian aviation, robotics plus machine tools, and computers plus software.

"What was an era of niche competition in the last half of the twentieth century will become an era of head-to-head competition in the first half of the twenty-first century. Niche competition is win-win. Everyone has a place where they can excel; no one is going to be driven out of business. Head-to-head competition is win-lose. Not everyone will get those seven key industries. Some will win; some will lose.

"The shift to head-to-head competition can be seen in the language of current economic discourse. In the Japanese, but not the American, version of the book *The Japan That Can Say No*, Mr. Ishihara states that the superpower military warfare of the twentieth century will be replaced by economic warfare in the twenty-first century, and that Japan will be the winner of the twenty-first century's economic wars. In the American version he talks about 'the Pacific age.' Nomura Securities sees a world where 'competition in the marketplace could well become extremely intense.'

"Similar views exist in Germany. On German television in February 1990, Chancellor Helmut Kohl of West Germany issued his counter declaration of economic war: 'The 1990s will be the decade of the Europeans and not that of the Japanese.' Implicitly, Chancellor Kohl sees an America already out of the game. The same point has been bluntly put by the prime minister of France, Edith Cresson: 'There is a world economic war on.' The rotating head of the EEC and foreign minister of Italy, Gianni De Michelis, thinks that 'all this points to Europe recovering its role as the core of the world economy. The next ten years will make

evident Japan's big short comings.' (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, pp. 28-31.)

Secret Meeting Among Largest Business Groups in the World

"In March 1990 the two biggest business groups in the world (the Mitsubishi group from Japan and the Daimler Benz-Deutsche Bank group from Germany) held a secret meeting in Singapore to talk about a global alliance. Among other things, both were interested in expanding their market share in civilian aircraft production. From an American perspective everything about that Singapore meeting was criminally illegal. It violated both antitrust and banking laws. In the United States banks cannot own industrial firms and businesses cannot sit down behind closed doors to plan joint strategies. Those doing so get thrown into jail for extended periods of time. Yet in today's world Americans cannot force the rest of the world to play the economic game as Americans think it should be played. The game will be played under international, not American rules." (Lester Thurrow, *Head to Head: The Coming Economic Battle among Japan, Europe and America*, p. 35.)

The Role of Corporate Socialism in Japan and Europe

"Both Europe and Japan believe that government has a role to play in economic growth. Airbus Industries, a civilian aircraft manufacturer owned by the British, French, German, and Spanish governments, is an expression of a pan-European strategy. It was designed to break the American monopoly and get Europe back into civilian aircraft manufacturing. Today it is a success, as it has captured 20 percent of the aircraft market and announced plans to double production and capture one third of the worldwide market by the mid-1990s.

"But that success came at a high price. An earlier effort, the Concorde, was a technical success but an expensive economic failure. Airbus Industries itself required twenty-six billion dollars in government investments and a captive market in the form of government-owned airlines to become successful. Only twenty-eight planes were built in 1986, but two hundred planes will be built in 1993. McDonnell Douglas's market share has been reduced from 30 to 15 percent. In 1990 Boeing's market share of new orders dropped to 45 percent – the first time in decades it had been below 50 percent. If 747's are not included (Airbus Industries has no plane in this market niche), Airbus Industries actually outsold Boeing. In this industry a greater European share can only mean a smaller market share for Boeing and the demise of McDonnell Douglas.

"There are now a number of similar pan-European strategic efforts (Jessi, Eureka, Esprit, Vision 1250) under way. Each is designed to help European firms compete in some major industry. European governments spend from 1.75 percent (Great Britain) to 5.5 percent (Italy) of their GNP in aiding their industries. If the United States were to spend what Germany spends (2.5 percent of GNP), it would

be spending more than \$140 billion to help its industries in 1991. In the economy that grew the fastest in Europe in the 1980s, that of Spain, government-owned firms produce at least half of the GDP. In France and Italy the state sector accounts for one-third of GNP.

"Germany, the dominant European economic power, sees itself as having a 'social-market' economy and not just a 'market' economy. Codetermination is required to broaden the ranks of corporate stakeholders beyond that of the traditional capitalistic owners to include workers. German governments (state and federal) own more shares in more industries (airlines, autos, steel, chemicals, electric power, transportation – some outright, some partially) than any noncommunist country on the face of the globe. Public investments such as Airbus Industries are not controversial political issues. Privatization is not sweeping across Germany as it did across Great Britain.

"Government is believed to have an important role in insuring that everyone has the skills necessary to participate in the market. Germany's socially financed apprenticeship system is the envy of the world. Social-welfare policies are seen as a necessary part of a market economy. Unfettered capitalism is believed to generate levels of income inequality that are unacceptable. (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, pp. 35-36.)

Fiscal and Monetary Cooperation Among the Trilateral Nations

"To work, a multipolar, integrated, open world economy requires fiscal and monetary coordination among the major countries – Germany, Japan, and the United States. A common locomotive is needed, and it can only exist if the major countries stimulate or restrict their economies in unison. (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, p. 60.)

The Formation of the House of Europe Is Unstoppable

"The federation of Europe will take a long time. It has already taken almost forty years just to get to the point where border controls can be abolished. Another century may well be necessary to complete economic and political integration. Progress will be erratic – two steps forward, one step back, one step to the left, one step to the right.

"It is easy to make a long list of difficult issues that will have to be resolved. The list can easily be used to argue that real European integration will never occur. But the formation of the House of Europe is now unstoppable. First, the opportunities to create an integrated House of Europe are just too good to pass up. An opportunity as good as this one hasn't existed since the fall of the Roman Empire. Second, the need to compete against the Americans and the Japanese in a global economy almost demands that the House of Europe be built. It isn't, the

individual countries of Europe will find themselves economically marginalized between two much bigger, more aggressive economies. Third, enough integration has now occurred to make it very difficult for anyone to withdraw. Fourth, an internal dynamic has been set up whereby each step forward essentially forces the participants to take further steps forward.

"The ever-tighter degree of economic integration that is required by steps taken in the past is neatly illustrated in a sequence that began with the decision to build a European Exchange Rate System (ERS) to prevent the destabilizing effects of large currency fluctuations – a step taken to insure that business firms could make large investments without the risk that sudden large currency swings would make them worthless. But once the ERS was in place, it was obvious that if it were to work, monetary policies would have to be harmonized. If one country were to print money much faster than the rest of Europe, the value of its currency could not be stabilized. As a result, the existence of the ERS essentially forced the Europeans to think about a European Monetary System (EMS), the details of which are now under active development.

"But once monetary policies are linked, it becomes necessary to start talking about a European central bank if one does not want the German Bundesbank to become the de facto central bank for Europe. Since each country will want to have some influence on monetary policies, and since this influence is only to be had if there is a European central bank, it is only a question of time until a European central bank comes into existence. Vague discussions are now under way.

"But if common monetary policies are adopted, then limits must be placed on government fiscal deficits if the deficits of individual countries are not to absorb the capital funds that other member states want to put into private investment in plant and equipment. Monetary coordination forces fiscal coordination. Similarly once markets are opened to flows of goods across national boundaries in 1993, business firms from different European countries will require a level playing field where each faces approximately the same taxes and social charges. If taxes were not equalized, production would simply move to the country where taxes were lowest, and the lowest-spending country would essentially force everyone else to adjust to their expenditure patterns. To prevent this from happening, the harmonization of taxes and social charges is now being negotiated in Brussels.

"To equalize taxes, countries must agree upon common spending patterns. With similar taxes and similar spending patterns, national governments lose many of their traditional economic powers. In this circumstance, giving more political power to a European parliament doesn't seem like such a radical change.

"Political integration will lag economic integration, but economic integration inevitably forces political integration. Quick, collective foreign-policy decisions will be the most difficult of all – witness Europe's problems in coming to grips

with the Persian Gulf War or the civil war in Yugoslavia. But the House of Europe will be built.

"Adding Middle and Eastern Europe to the House of Europe is also going to be a slow process, although several countries have already signaled their desires to join. The short run economic prospects for rapid growth in the ex-communist countries were grossly exaggerated when communism first started to disappear. The transition from central planning to the market is going to be much slower and much more painful than was originally imagined. The human and physical infrastructure of capitalism will have to be built – both will take a long time.

"To start a capitalistic economy, there must be some initial distribution of resources – property rights. All of those things now technically owned by the state have to be given or sold to someone. Who is to get them? What is the fair way to distribute existing economic resources? Neither the theory nor history of Western capitalism provides any answers. There is no right initial distribution of property in a market economy. Market economies can adjust to any initial distribution of property rights – no matter how equal or unequal. Historically, Western capitalism sometimes began by taking the distribution of property rights that came out of feudalism (Britain), and sometimes began by having a revolution to alter the feudal distribution of property rights (France). Lacking theoretical or historical guidelines for handing out property, Middle and Eastern Europe will spend a lot of time figuring out how to do it. Yet markets cannot start until it is clear who owns what. Who has the right to sell what? Who can collect rent from whom?

"Some countries will solve their problems faster than other countries, but the transition will occur. The transition will occur because everyone in Middle and Eastern Europe understands that communism is dead and that they cannot go back to the old system. They have no alternative but to try something different. They may fail in their efforts and end up joining the Third World, but they have to change." (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, pp. 69-72.)

Writing the Trading Rules for the Twenty-First Century

"The world has outgrown the GATT-Bretton Woods trading system and must build a new system based on the realities of a tripolar economic world. Irresistible forces cannot be resisted. If the pressures cannot be relieved in logical ways (a new Bretton Woods conference), they will be relieved in other ways. Since a new Bretton Woods conference cannot be held without a dominant power to force agreements, the European negotiations at Brussels will become the de facto new Bretton Woods conference. As the European Community harmonizes its internal rules and regulations, decides the conditions of access for outsiders, and offers associate memberships to other European nations such as Switzerland or

Czechoslovakia, it will effectively be writing the rules of international trade for the next century. Whatever rules it adopts, others will learn to play by those rules.

"It is an old axiom of history that the rules of trade are written by those who control access to the world's largest market. Everyone else needs access to that market and has no choice but to play by the rules of the game. It was always thus. Britain wrote the rules of world trade in the nineteenth century. The United States did it in the twentieth century. As the world's largest market, the House of Europe will be writing the rules of world trade in the twenty-first century, and the rest of the world will simply have to learn to play their economic game. (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, p. 75.)

Germany Is Not a Bastion of Free Trade

"...Germany is simply not the bastion of free trade that it is often made out to be in the United States. In a *New York Times* article entitled 'Greetings from Fortress Germany,' it is described as follows: 'Although less pervasive than in Japan, protectionism in Germany is often just as deep-rooted and effective. The telecommunication, banking, insurance, electrical utility, and chemical industries, for example, operate as virtual cartels. It is almost impossible for a foreign company to enter those markets without a German partner. Other barriers include restrictive laws, massive Government subsidies, and the rigid protocols of a clannish, old-boy network that dominates the economy....' (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, p. 79-80.)

Japan Has a Desire to Conquer the World

"In my trips to Europe I hear over and over again from private businessmen and public officials the phrase 'We are not going to let the Japanese do in Europe what they have already done in the United States.' What many have been saying privately for a long time, the prime minister of France, Edith Cresson, now says publicly. 'Japan is an adversary that doesn't play by the rules and has an absolute desire to conquer the world. You have to be naive or blind not to recognize that.' 'The Japanese have a strategy of world conquest. They have finished their job in the United States. Now they are about to devour Europe.' (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, p. 81.)

The Development of Managed Trade on a Regional Basis

"In the long run, regionalism may well be a positive development for the world. Free trade within regions and managed trade between regions may well be the long-run route to free world trade. Jumping in one big leap from national economies to a world economy is simply too big a leap to make.; It is necessary to

take smaller intermediate steps first, and quasi trading blocks combined with managed trade may be just such a necessary intermediate step....

During the transition from the GATT-Bretton Woods system to a system of quasi trading blocks with managed trade, there is apt to be a great deal of uncertainty. While it will be clear that the old GATT-Bretton Woods system no longer exists, the exact parameters of a new system combining quasi trading blocks with managed trade will be murky. (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, pp. 82 & 85.)

Japan Secretly Aspires to be the World's Leading Economic Power

"...The Japanese secret is to be found in the fact that they have tapped a universal human desire to build, to belong to an empire, to conquer neighboring empires, and to become the world's leading economic power. Their goal is market-share maximization (strategic conquest) and value-added maximization (a measure that includes profits and wages), not simple profit maximization...." (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, p. 118.)

Corporations Are Developing World Empires

"Empires don't exist because there are great individuals who force their leadership upon resistant followers. Empires exist because individuals want to be part of a group, want to have the security that can only be had if one is part of a group, want to be held in esteem by those above and below them in the group's pecking order, and want a place to build and lead – even if they are not the supreme builder or leader that history will remember....

"In the modern world, corporations offer the best opportunities for empire building....

"To have power over others requires an institution where there are strong voluntary incentives to participate and where exit is not easy. One cannot really lead – exercise control over others, organize activities where some real degree of personal self-sacrifice is both demanded and given – unless there are real rewards and punishments. The modern industrial leader is not a general who can shoot deserters, but he is a leader who can hand out real punishments and rewards. Individuals can be demoted or fired, banished from the group, deprived of security, belongingness, and the esteem of others. Individuals can be promoted. Economic soldiers can be made into officers; majors can be made into generals. Together, individuals can build something bigger than they could ever dream of building by themselves. Men and women can conquer markets much as they used to conquer neighboring clans. (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, 120 & 121.)

The Trilateral Nations Will Set Policies for the World

"Together, America, Japan, and Germany are large enough to be the locomotive pulling the rest of the world into prosperity. If they act together, the rest of the world has little choice but to adopt similar policies...." (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, p. 239.)

Lender of Last Resort

"Nations have learned through brutal experience that they need managers for their financial systems. Usually, the necessary institutions were created after disasters such as the stock-market crash of 1929. With the development of a world financial system, the world needs a financial manager just as much.

"Developed countries need lenders of last resort when financial panics, such as the crash of October 1987, strike. In that particular case close coordination between the world's major central banks essentially created a temporary world central bank until the crisis was over. But circumstances may well arise when ad hoc coordination does not work.

"Developing countries need a real world central bank to clean up the mess in their financial systems, much as the American banking authorities are now cleaning up the mess in America's savings and loan industry. In both cases there is plenty of blame to be assessed as to who created the mess, but the real problem is not in assessing blame or in punishing the wicked but in restoring the financial system to health so that real growth can resume. If the Second World and Third World are to start growing (and it is in everyone's long-run self-interest that they do so as soon as possible), some system has to be devised for handling the outstanding international debts that they have incurred in the past but cannot be repaid in the future. As long as those debts exist, growth cannot resume.

"Only a world lender of last resort can deal with the existing debt problems, since only it can assume the losses that will have to be assumed. To force the private banks that originally made the loans to assume the losses would simply be to create a commercial banking crisis that would rival the existing savings and loan crisis. In the end the taxpayer would have to pick up these costs, and they undoubtedly would be larger than any costs associated with a world central bank.

"Second and Third World debt problems have been given to the World Bank and the International Monetary Fund to solve, but these institutions can only continue to put patches on a system that already has too many patches. Neither institutions was designed to deal with debt problems; neither has the necessary instruments at its disposal. They can stave off collapse, but they cannot return Second and Third World financial systems to health." (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, New York: Bantam Books, Inc, 1993, pp. 239-240.)

Japanese Financial Success Is Due to Exports

"Japanese success has been based upon an export-led economy. Exports were the fastest growing part of the economy...." (Lester Thurow, *Head to Head: The Coming Economic Battle Among Japan, Europe, and America*, p. 249.)

A Global Environmental Protection Agency with Coercive Powers

"Let's not deceive ourselves. It is necessary that the community of nations exert pressure, even using coercion, against countries that have installations that threaten the environment. International instruments must be transformed into instruments of coercion, of sanctions, of boycott, even – perhaps in 15 years' time of outright confiscation of any dangerous installation. What we seek, to be frank, is the legitimacy of controlling the application of the international decisions...."

"We need a real world authority, to which should be delegated the follow up of the international decisions, like the treaties signed [at Rio, June 1992].... This authority must have the capacity to have its decisions obeyed. Therefore, we need means of control and sanctions. I well know the nervousness of some countries when they consider their sovereignty to be threatened. But we are not dealing with national problems. These problems are international. Pollution knows no borders and the sea level cannot change in one place without changing in another.... Obviously, this supranational authority must be a world authority." (Michael Rocard, Former Prime Minister of France. Quoted in Dixy Lee Ray, *Environmental Overkill*, Washington, D.C., Regency Gateway, 1993, pp. 10-11.)

Global Corporations Dominate the World Economy

"The TNCs [Trans-national Companies] have gained an increasing share of world trade. According to Dr. Kevin Watkins of Oxfam:

"Traditionally international trade is seen as an activity carried out between nations. In reality, trade flows are dominated by powerful corporations located overwhelmingly in Western Europe, North America and Japan. In 1985, the combined sales of the world's largest TNCs exceeded \$3 trillion, equivalent to one third of the world's Gross Domestic Product.'

"The number of branches, subsidiaries, and affiliates of TNCs from the industrialized countries is estimated to be around 100,000. Smaller TNCs do exist but the larger ones dominate. At least 65 million people are directly employed by TNCs, 43 million in the home countries and 22 million in host countries, representing about 3 per cent of the total estimated workforce throughout the world of over 2000 million. According to the World Bank TNCs control 70 per cent of world trade. In 1990, the world's largest 350 TNCs accounted for almost 40 per cent of world merchandise trade which then totalled US \$3485 billion. The top 500

TNCs control two thirds of world trade. In addition over 40 per cent of international trade is carried out *within* TNCs.

"The amounts of money involved are staggering. More than 35,000 TNCs now account for \$1.7 trillion in foreign direct investment and global sales totalling \$4.4 trillion. The 15 largest global corporations today, including names like General Motors, Exxon, IBM, and Royal Dutch Shell, have a gross income larger than the GDP of over 120 countries, including almost all Third World countries except for the very largest. In 1970, over half the 7,000 TNCs traced by the UN were based in the USA or UK. In 1990, just under half the 35,000 TNCs it found were from four countries: USA, Japan, Germany and Switzerland, with the UK now seventh most popular TNC base. Excepting South Korea, all the top 500 industrial companies listed in the US business magazine *Fortune's* Fortune 500 are headquartered in the North with the USA home to 167, Japan to 111, the UK to 43, Germany to 32, and France to 29. The combined wealth of the top 500 manufacturing and top 500 banking and insurance companies amounts to US \$10 trillion, twice the USA's GDP.

"Within trade sectors, a similar picture of global concentration emerges and this has devastating effects. According to UN figures, almost all primary commodities are each now marketed by fewer than six multi-commodity traders. For example, Cargill – a family-owned Canadian corporation – has a greater sales turnover in coffee alone than the GDP of any of the African countries in which it purchases coffee beans. Cargill also accounts for over 60 per cent of world trade in cereals. According to Christian Aid, the low prices of world primary commodities, produced by Third World countries overwhelmingly, is in part due to the existence of so many commodity producers but so few commodity buyers, i.e. companies. And it is right. The top five companies have 77 per cent of world cereal trade; the biggest three companies in bananas have 80 per cent of world banana trade; the biggest three cocoa companies have 83 per cent of world cocoa trade; the biggest three companies have 85 per cent of tea trade; and the biggest four companies have 87 per cent of world trade in tobacco.

"Consumers may be bedazzled for choice when they go food shopping, but behind the many products and brands are often relatively few owner companies with enormous power. For instance, one US company, Sara Lee, owns coffee brands in Europe which have 74 per cent of the Netherlands market, 27 per cent of Denmark's, 21 per cent of Spain's and 15 per cent of France's. A large study in the 1980s for the UN found very high levels of TNC control in the world's food markets. And of 189 TNCs which had turnovers of above \$300 million in 1976, all but one were based in the developed world – the exception, Bunge and Born was one of the world's giant grain traders. One hundred of these TNCs had revenues of over \$1 billion and five above \$10 billion, even then. This food power was being used to diversify into other sectors – shipping, tobacco, finance, pharmaceuticals. Only a sixth were not diversifying.

"High levels of concentration are not just the preserve of primary commodities. By 1989, the world's top 20 agro-chemical companies accounted for 94 per cent of world trade – nine of these were companies from Europe, six from the USA and five from Japan. The top 14 car companies produced four out of five of the world's cars; of these, three based in the USA produce 33 per cent; six based in Japan produce 25 per cent; and Europe's companies produce 21.5 per cent. The same concentration and disparity between the industrialized world and the developing world is happening in one of the world's fastest growing sectors – telecommunications. Western Europe (the EC and the European Free Trade Area (EFTA) combined) is the largest world market, at 47 per cent of the overall world market. North America has 32 per cent, Asia 11.5 per cent and South America only 2 per cent. Ten TNCs control 66 per cent of the world semi-conductor industry and nine telecommunications TNCs control 89 per cent of that market. In computing, IBM owns more than 60 per cent of the world main frame computer market. TNC capital is the source of these big corporations' power.

"We could go on, but the big question is whether this level of concentration matters. We think it does for three reasons. Firstly, it hands over power to unelected and unaccountable people. The top 87 finance companies in the world for instance are valued at US \$1,300 billion, a concentration of power which gives a relatively small number of boards of directors extraordinary control over a high proportion of the world's liquid capital upon which investment (which can either improve or threaten people's standards of living) depends. Secondly, concentration means that power gets more distant from the ordinary consumer. When consumers shop, they face many products, but few owners, and decisions about their local market may be being taken on the other side of the world. Thirdly, concentration affects standards of production which affect the quality of life...." (Tim Lang and Colin Hines, *The New Protectionism: Protecting the Future against Free Trade*, New York, The New Press, 1993, pp. 34-36.)

A Web of International Institutions is Making Up a Global Confederal Government

". . . Although a single and increasingly interdependent global political process is emerging, America's difficulty in exercising effective global authority within it – because of inner weaknesses derived more from cultural than from economic causes – could produce a situation of intensifying global instability....

"To be sure, the only long-term alternative to global anarchy is some form of a global confederal structure. The term 'global confederation' may be a better description of what might gradually emerge than 'world government,' if the novel global political process assumes increasingly cooperative forms....

"However, the global political process – assuming that the forces of chaos do not come to dominate the world scene – is generating progressively deepening

cooperation on a global scale. That cooperation has to assume, and is assuming, organizational forms, expressed through the growth in number and in power of international bodies, both of a functional type (such as the various multilateral organizations) and of a common cooperative and increasingly also decision-making political organ, namely the Security Council of the UN. The result is a web of institutions that cumulatively express the reality of international interdependence. That web, furthermore, is not a static but a dynamic condition: it involves a progressive expansion in the scope of the authority wielded by the various bodies, prompting the step-by-step emergence of what is in effect a rudimentary confederal governmental structure of worldwide scope.... (Zbigniew Brzezinski *Out of Control: Global Turmoil on the Eve of the Twenty-First Century*, New York: Charles Scribner's Sons, 1993, pp. xiii, 150-151.)

The Geopolitical Map of the World

"American power by itself will be insufficient to impose the American concept of 'a new world order.' Just as important, the inclination toward cultural hedonism may make it more difficult for America to develop a shared language with those major portions of mankind that will feel they are excluded from meaningful participation in world affairs. As a consequence, they are likely to be on the lookout for some mobilizing message and some relevant example around which to rally in a comprehensive challenge to the global status quo.

"In any case, it is almost a certainty that the geopolitical map of the world will become increasingly complex. Instead of a new world order, the states that possess power and wealth will group together, so that they can better compete against their rivals and so that they can better protect their assets. In specific terms, this foreshadows the emergence of several principal clusters, with America spilling over into some of them but probably with a declining capacity to decisively determine the internal policies of clusters other than its own. These clusters will be in effect both competitive regional economic blocs as well as political alliances, with the political alliances (especially with America, undertaken for security purposes) in some cases mitigating the economic rivalries.

"The probable global power clusters, which will collude, cooperate, and compete with one another within the more interdependent but still unstable global political process, are likely to include:

"1. North America, dominated by the United States, organized on the basis of the North American Free Trade Area, creating thereby the world's single most powerful economic bloc, and probably also leading in time to the gradual integration of Canada with the United States (perhaps becoming at some point a more formal North American confederation. Its zone of dependence will be the rest of the Western Hemisphere, with Cuba overthrowing its communist system at the latest following Fidel Castro's death.

"2. Europe, probably integrated economically, but with its political unity lagging considerably behind economic integration, and thus still faced with the problem of a powerful Germany, and with Europe's eastern boundaries in a state of flux, given the continued uncertainties of the post communist transition. Its zone of dependence will be both Eastern Europe as well as much of Africa.

"3. East Asia, dominated economically by Japan, but lacking a commensurate political and security framework, and thus potentially vulnerable to regional tensions, especially as China begins to flex its economic as we the world's deprives. Its zone of dependence is likely to be the far eastern portions of the former Soviet Union, as well as Southeast Asia and also Australia and New Zealand...." (Zbigniew Brzezinski, *Out of Control*, pp. 206-207.)

Institutionalizing a Global Community Among the Trilateral Nations

"In our age the profoundest problems that humanity faces have become too great for the nation-state...to handle...[T]he world today needs more than the nation-state to organize global peace, to promote global welfare, to diffuse globally the fruits of science and technology, and to cope with global environmental problems. All of these things can be done more effectively and rationally if nation-states are encouraged to cooperate in the setting of a larger community that reflects what unites them and submerges what has traditionally divided them.

"Accordingly, to institutionalize the progressive emergence of such a common global community new forms of enhanced cooperation will have to evolve along two major axes: the trilateral relationship among the world's richest and democratic states of Europe, America, and East Asia (notably Japan); and through the United Nations as the wider and more representative framework of global politics. This will require a redefinition not only of America's world role but also the adoption by Europe as well as Japan of a broader outlook; and it will require the deliberate enhancement of the UN's political role, even at some cost to the unilateral power of some presently dominant states.

"The gradual redistribution of responsibilities within the trilateral relationship is needed in order to stimulate a wider appreciation within the more advanced and prosperous portions of the world of a common and shared responsibility both for peace and for peaceful change. . . (Zbigniew Brzezinski, *Out of Control*, pp. 221-222.)

The Development of Giant Monopolies Through International Corporate Alliances

"The way the world economy works has changed dramatically during the past forty-five years. In general, firms have adapted faster than governments. Over time the gap between existing regulations and reality has grown so large that it

interferes with effective management of global commerce, and discourages economic growth.

"Government officials and business leaders are looking for answers to three questions. First, does the spread of activist government policies on international competition necessarily imply an end to an open and integrated world economy? Our answer is no: countries can open markets to foreign competition and embrace industrial policies simultaneously. We define *open industrial policy* as one that gives foreign firms the freedom to contest local markets, not one that removes all trade barriers. Some economists worry that new nontariff barriers and restrictions on foreign investment will undermine the integration of the world economy created by the post-1945 regime for free trade. We believe that they are confusing closure with interventionist responses to new economic challenges. Governments are beginning to regulate open, competitive markets in new ways. New global policy responses are needed, but the open world economy is not on the verge of collapse.

"Since World War II the distinctive corporate management style, economic organization, and political relations of U.S. industry with Washington have been the standard for the world market. Global rules evolved in response to the agenda of competitive issues raised by firms rooted in U.S.-style approaches (which were themselves a variant of a century of British tradition). The second question is related to the structure and behavior of firms: can the implicit model of the relationship between firms and governments on which world trade rules has rested since 1945 be sustained? In short, what will be the fate of the U.S. model of industrial organization that has dominated global commerce in one form or another since the mid-nineteenth century? Can the U.S. model be revived, or must it be replaced? Our answer is that the old model of industrial organization is obsolete and needs to be replaced by a new one.

"The redistribution of economic power from the United States to Japan and Europe means that new styles of industrial organization will share the strategic center. We contend that the old model for organizing international commerce is as out of date as American hegemony. The United States is still the greatest military power on the earth, the U.S. economy still eclipses Japanese and resurgent European economic might and could rebound in the 1990s, but the United States no longer can manage the world economy alone, and neither Japan nor Europe is able to or seeks to assume the mantle of hegemonic leadership. Therefore, countries and companies need to find new ways to manage global economic relations.

"New national rules for managing world commerce already have emerged. As new forms of government strategy for advancing economic growth (such as industrial targeting by Japan) have advanced to the forefront, corporations react and adapt, usually more rapidly than governments. The emergence of transnational corporations (TNCs) and later of international corporate alliances (ICAs) were

logical reactions by private firms to changing circumstances. ICAs were part of the problem for policymakers but part of the solution for private firms.

"The U.S. model is being supplanted. For the international economic order to thrive, it must adapt and solve the problems posed by the globalization of the private sector. The process of developing and implementing a new model is already underway. It is significant that as governments and corporations struggle to make this transition, the nature of international economic relations is being transformed: free trade and investment were at the heart of the old model; market access, fair competition, and the internationalization of domestic regulations will be at the core of the emerging model of international commerce.

"As firms change, they are making national economies more interdependent. Even if governments introduce new forms of oversight to manage competition, greater interdependence is likely. Governments may protect national firms, but the production and technology of many firms already are so global that world economic integration will proceed on a competitive basis. The third question follows from the other two: in the future will it be possible for governments to sustain the traditional tools for managing world commerce? In other words, will policy makers continue to rely mainly on multilateral trade agreements, emphasize trade as the leading edge of global commerce, and assume that domestic and international economic policies are separate and independent from each other? Again, our answer is no. New ordering principles are needed that redefine the boundaries separating global and regional, trade and investment, domestic and international, and goods and services.

"The story of international relations until the 1960s was about the cumulative extension of the power of sovereign territorial states over political and economic affairs. One of the most dramatic changes of the past three decades is the growth of political and economic activity outside the traditional jurisdiction and organizing principles of states. The European Community is the most obvious example. An EC corporation may someday have an EC charter and have rights and duties defined by a blend of EC and national laws. The European Community is unlikely to replace the individual European states as the ultimate source of political authority, but U.S. officials recognize that a complaint against Airbus is already a complaint against the European Community as well as several member governments. Alliances are corporate responses to fundamental economic trends, to market imperfections created by government rules, and to global corporate missions that cannot easily be organized by traditional national rules and economic infrastructures.

"Alliances between firms from different countries are not a new phenomenon. For decades, transnational corporations have operated joint ventures with local firms in host countries. Most commonly, joint ventures linked a large TNC from an industrial country with a small firm based in a developing country. Most of these

joint ventures operated exclusively in the developing country. Usually they were formed to satisfy local rules concerning ownership and production, because the laws of many countries require that their citizens control a minimum percentage of any major business. Similarly, many countries insist that a portion of inputs into the production process be sourced locally. To meet such requirements, transnational corporations often entered into joint ventures with local firms. Typically, the foreign TNC retained majority ownership and management control over the local operation. To earn their minority shares, local investors generally provided the required local content.

"Partnership arrangements also linked firms from industrial countries. For example, NEC, one of Japan's most visible high-technology firms, was set up in 1899 as Japan's first joint venture with a U.S. company – Western Electric. ITT acquired Western Electric's interest in 1925, and NEC eventually 'freed itself from this affiliation and began to grow as an independent company' in 1965. ITT remained NEC's largest stockholder until the early 1970s. In many of these ventures the local partner supplied low-priority products or inputs that the TNC used throughout its global operations. Original-equipment manufacturing deals usually involved products that were considered to be outside the core business of the company that purchased them. Thus if Olivetti relied on Japanese suppliers for facsimile machines offered in its own consumer product line the Olivetti almost certainly did not intend to built its strategic advantage in the electronic marketplace on this technology.

"By the early 1980s a new type of joint venture emerged that focused more on strategic processes, products, and markets. Giant firms like AT& T, Philips, General Motors, and Toyota entered into international corporate alliances that joined leading strategic competitors from different countries.

"We define *international corporate alliances* (ICAs) as ongoing relationships between companies from two or more countries that involve significant markets, products, R&D, and other important process technologies that shape the strategy of global market leaders. An international corporate alliance between General Motors and Toyota occurs if one or more vehicles important to the plans of both firms in key markets are jointly produced on an ongoing basis; the project by itself is so significant to both firms that we consider it an ICA. If Toyota enters a coproduction arrangement with a subsidiary of Tata Industries in India, however, this is not classified as an ICA; it is a traditional joint venture even though Tata is an important Indian industrial group. Finally, Ford and Mazda may have minority ownership positions in Kia Motors of Korea, which provides them with low-end vehicles for sale internationally. Kia is more than a provider of local content, the product is strategic for Ford, and although Kia is not now a strategic competitor to Ford, it could become one. The Ford alliance therefore is part of a pattern of relationships that is transforming Ford (and General Motors). No two or three alliances may equal the importance of Ford in the market, but Ford itself may rely

on a dozen alliances to keep it competitive. Thus Kia is part of the ICAs of Ford because the company's central strategy relies directly on a group of ICAs for key products and processes." (Peter F. Cowhey and Jonathan D. Aronson, *Managing the World Economy: The Consequences of Corporate Alliances*, New York: Council On Foreign Relations, 1993, pp. 3-7.)

The Endangered American Dream

Americans like to think of themselves as a generous, warmhearted but also very practical people, quite naturally resistant to ideological fascinations. Before its downfall, Marxism-Leninism won the intense loyalty of millions all over the world, from poets and philosophers to seemingly tough-minded trade unionists. But in America only a handful of eccentrics ever fell into the trap.

Yet there is one ideology that grips the American mind – the ideology of free trade. Elite Americans are no longer seriously churchgoing but their unquestioning faith in the ideology of free trade is intact. Just as Marxism-Leninism offered the promise of prosperity for all, in exchange for giving all power to an all-wise party leadership, free-trade ideology too offers a large and attractive promise and demands something in exchange: the greatest possible prosperity for each and all in the entire world economy, if only no effort is made to protect anyone with tariffs or any other artificial barriers to free trade. And just as Marxism-Leninism was based on the theory that if capitalists were eliminated their wealth would remain and grow even more rapidly, free-trade ideology is based on the theory of "comparative advantage": if England is more efficient than Portugal in producing textiles, and Portugal is more efficient than England in producing wine, both countries are better off if England produces all the textiles they both need, and Portugal produces all the wine, each then importing its unmet need from the other.

That is the theory taught in every economics class and printed in every textbook. It is logical to a fault. Why should the Portuguese strain to produce, say, three yards of woolen cloth when, with the same effort, they could take advantage of their favorable climate to produce, say, four barrels of good port wine, then ship just one to pay for the import of, say, five yards of better British cloth? As a snapshot the theory is beyond dispute. Yet it is fatally defective, because it ignores economic and technological development; in fact it ignores the future altogether.

For one thing, as prosperity grows and people are no longer content with one work outfit and one Sunday outfit, the demand for textiles increases by 200%, 300%, 500% over the years. By contrast, the individual demand for wine grows little if at all, leaving the Portuguese economy stagnant except for sheer population growth, while the English economy grows rapidly in this textiles-and-wine world. For another, the theory of free trade ignores the very different technological potential of each industry: over the years, textile producers can mechanize and

eventually computerize their production, while wine is still pressed by the bare feet of peasants.

Most important by far is what happens to each society over time under the rules of free trade: the British textile industry and its skilled workers, foremen, designers, engineers, color chemists, and managers will need, and support, a whole variety of educational, technical, and scientific institutions and projects that can germinate future industrial progress. By contrast, Portuguese peasants, vintners, and landlords will need and support none of the above in their simpler economic lives. Moreover, Britain's textile industry demands a textile-machinery industry as well; which, in turn, gives birth to other industries, while Portugal's wine industry will still support only coopers and their barrel making.

The Portuguese in this classic example would therefore be well advised to ignore the theory and impose a stiff textile tariff to keep out British imports, thus allowing a textile industry of their own to grow and survive. Even if the British do not retaliate with a wine tariff of their own, as they may well do, the Portuguese standard of living will immediately drop. Instead of a desirable mix of good native wine and good imported cloth, the Portuguese will have to get by with small quantities of inferior cloth, inefficiently produced against the grain of Portugal's comparative advantage. But in a textile-and-wine world that is the only way for the Portuguese economy and society to develop at all. As it does, moreover, the technologies and institutions they acquire will open new avenues of industrial growth, including some in which Portugal might be less inefficient, or even quite efficient.

Japan was in Portugal's position twice within a century. First when the country was initially opened to foreign trade after the intrusion of Commodore Perry's American fleet and the 1868 revolution. And then again in 1945, when Japan's economy was in ruins, and even its surviving industry was badly outdated after many years of war production (Japan's war had started in 1936, long before Pearl Harbor). The United States was then of course the world's most efficient producer of virtually every industrial product; in some cases – including the first civilian electronics – it was the only producer.

Japan should therefore have been content to produce raw silk, paper lanterns, and the cute mechanical toys in which it still had a comparative advantage, while importing almost all other industrial goods. For very little could be produced efficiently given the state of Japanese industry. But instead of being paralyzed by theory, the Japanese simply ignored it, preferring the development of their economy to efficiency and an immediately better standard of living. High tariffs, tight quotas, and outright import prohibitions kept out US and other foreign goods to assure well-protected markets for Japan's feeble industries, which were also helped directly with low-interest investment loans, tax exemptions, and plain subsidies.

The Japanese people thus paid twice for industrial development, first by having to buy inferior homemade products at high prices instead of better/cheaper imports; and then because it was their taxes that paid for all the bounty given to industry. As consumers, and taxpayers, the Japanese were ill-treated. But as producers, their lives prospered and grew, with ever-wider opportunities both in rebuilt industries and in brand-new industries, as well as in the service superstructure that goes with them: banking, insurance, financial services, advertising, and more. They had to wait until the 1980s for any rapid rise in their standard of living, but the dignity of employment was assured to virtually all almost from the start, along with the increasing satisfactions of personal and national achievement.

To be sure, even free-trade theory recognizes an exception: it allows that "infant" industries (or war-ravaged industries) can be usefully protected for a short while, until they can stand on their own feet. But the politicians, academic economists, government officials, and journalists who "believe" in free trade are not really guided by the theory. They are, after all, believers in an ideology, not thinkers. Thus they fail to recognize the real significance of the tidal waves of rapid technological development that can now totally outdate products in a few years (remember "eight-track tapes"?) and entire industries in a few more (e.g., batch-production steel). That significance is simply this: nowadays a perfectly grown-up industry can become a helpless infant at any time. Aside from the world leader of the moment in any particular industry or product line, all other countries might be left only with infants in need of protection.

If help is refused ... technologically overtaken industries must die, as the US consumer electronics industry has died, instead of recovering to compete again – as they might, if their markets were protected for a while. Hence the theory is itself invalid for all practical purposes, because the one allowed exception for "infant" industries happens to apply precisely to the fastest growing, most creative, and most promising industries. In other words, the exception is now more important than the rule.

There are other things, too, that the politicians, academic economists, government officials, and journalists who believe in free trade fail to recognize. One is that today's economic world is far removed from Main Street, USA, with its strictly private business, all equally subject to the rule of balance sheets, profit and loss accounts, and possible bankruptcy. National bureaucracies and governments not only regulate and tax but also manage state-owned companies or entire industries in some countries, and actively help private business in many more countries. They keep out foreign competition by means fair or foul, they provide market information (and sometimes the fruits of industrial espionage), they give research and development grants, they issue loan guarantees for corporations in trouble, they award extra-profitable contracts to strengthen favored "chosen instruments," they co-invest in plant and machinery, or simply hand out money. Only in freewheeling Hong Kong and Macao is the idealized state of "free

enterprise" closely approached. Elsewhere, including the United States (remember the Lockheed bailout – one of many – and the Chrysler loan guarantee?), it is rather "state-assisted enterprise" that should be celebrated by euphoric after-dinner speakers.

Of course these things are known to all. But free-trade ideology, like all ideologies, has a curious effect: it has a way of creating confusion in the mind of believers between what ought to be and what is. They know that the world is far different from Main Street, USA, yet they do not truly accept that reality in their minds. When it comes to the specific cases, they invariably oppose protectionism of any sort for any reason at any time – as if by keeping faith with the ideology its assumptions would miraculously become true. Even when the strongest case is proven, they take refuge in the claim that trade barriers would inevitably end up protecting only sloth and inefficiency. Yet there is no reason why purely domestic competition should not suffice to keep businesses on their toes in any large economy, with different competitors in each industry. There was certainly no sign of lethargy or corporate self-indulgence in Japan, through decades of protectionism.

There is one final parallel with Marxism-Leninism: the true believers in free trade are ready to sacrifice hugely for the sake of the splendid promise of their ideal – jobs, businesses, entire industries abandoned to foreign competition. Sometimes there is no alternative, as with industries based on cheap labor (e.g., hand-printed cotton goods). But as often, temporary protection is just what the (Japanese) doctor would have ordered, to allow overtaken industries to recover and flourish again. Instead, they are irrevocably abandoned, sacrificed on the altar of theoretical beliefs. Ideologues can be expected to do that of course – but in this case they account for a large proportion of all American politicians, academic experts, government officials, journalists, and opinion leaders.

Realities of the Global Market: Airbus Industrie

As it happens, the world's airliner industry provides the most extreme example of the divergence between the truths-in-theory of the ideology, and sordid reality. To begin with, the only significant foreign competitor for the two remaining American producers of jet airlines, Boeing and McDonnell-Douglas (MacDac), is the European consortium Airbus Industrie. Ostensibly a commercial company like any other, Airbus is in fact heavily subsidized and financially guaranteed by the governments of France, Germany, Britain, and Spain. Each has its own favored aerospace company – its "chosen instrument" – and they form the Airbus consortium among them: France's Aerospatiale and Deutsche Aerospace have a 37.9% share each, British Aerospace has 20%, and Spain's CASA has 4.2%. These companies are neither small nor weak. In combination, including their military divisions, they employed some 550,200 people in 1990, as opposed to 161,700 for Boeing and 121,190 for McDonnell-Douglas, and in that year their total sales

amounted to \$84.8 billion, almost twice as much as McDonnell – Douglas and Boeing combined. But what makes Airbus Industrie so formidable is the government support it receives.

It now costs billions of dollars to design and engineer in detail a new airliner – money that Boeing and MacDac must borrow up front, and pay interest on every day during the several years that pass from the start of design to the first sale of a completed aircraft. That, obviously, is a very heavy burden, especially with the high long-term US interest rates caused by the American refusal to save, and the heavy government borrowing needed to cover huge federal deficits. But Airbus Industrie is virtually exempt from such financial agonies: its first airliner, the A300, was launched in May 1969 with \$800 million in government subsidies; the A310 that followed was developed from July 1978 with a \$1 billion subsidy; next the A320 was started in March 1984 with \$2.5 billion; finally the A330 and A340 were launched in June 1987 with \$4.5 billion in government subsidies.

Admittedly these are not outright grants but rather loans from each government to its own "chosen instrument" aerospace company – except that no bank in the world has ever dealt so kindly with a borrower: first, the interest rate is, in effect, zero; second, Airbus Industrie need repay its loans only if it happens to have money to spare. So far, however, the consortium has continued to lose money, even though by 1990 it had delivered more than 700 aircraft to 102 different airlines all over the world. No normal commercial enterprise, not even the very largest of international corporations most heavily shielded by banking support and interlocked shareholdings, could have survived the cumulative losses of Airbus Industrie over the years. There is certainly no prospect that the four sponsoring governments will be repaid: their total subsidies were last calculated at \$26 billion. But profit and loss accounts are for "little people," in the memorable phrase, a category that includes McDonnell-Douglas and even Boeing in this case.

When some European economic experts complained about the huge cost of Airbus to the French, German, British, and Spanish taxpayers, their impertinence was firmly dismissed by Erich Riedl, Germany's aerospace coordinator: "We don't care about criticism from small-minded pencil-pushers."

... In the twenty years from 1971 to 1991, Airbus Industrie increased its share of worldwide airliner market from near zero to 26%. In the process, the American airline industry lost that much in production and sales, mostly overseas sales of course. The lost 26% of airliner sales could have reduced the US trade imbalance (only the chemical industry exports more) and increased the profits of Boeing, McDonnell-Douglas, and all their subcontractors. Those profits, in turn, could have provided more capital for research, development, plant, and equipment. Moreover, Airbus Industrie is still expanding. Its managing director, Jean Pierson, has published the consortium's ambitious goal: "If we make no mistakes, we should achieve a 40% share of the market in the next fifteen years."

If that comes to pass, McDonnell-Douglas is unlikely to survive in the airline business, and Boeing, too, would be much weakened. In any case, tens of thousands of well-paid American industrial workers, scientists, technicians, designers, engineers, managers, and salespeople would lose their jobs in the industry. Further jobs would be lost in great numbers in the many different industries that supply materials, components, and machinery. All the lost jobs would mean as many lives disrupted and most probably diminished; and nationally, there would be a further slide toward a prevalence of low-paid, low-skill service jobs in US economy – not "flipping hamburgers" perhaps, but certainly some ax-airliner builders would end up cleaning and maintaining Airbuses....

Airbus Industrie is by no means a unique case. On the contrary, virtually every promising industrial sector has its own version of Airbus Industrie in one country or in several, whether for computers and data processing software, biotechnology, advanced materials (superconductive, amorphous, or ceramic), satellite launchers, telecommunications, and more. If there is no subsidy for a chosen corporation or consortium as in the Airbus case, then there is a state-funded "national technology program" that serves the same purpose for an entire industry.

Geo-Economics

The broader meaning of this new phenomenon is plain enough. Unlike the handouts given to failing industries, or the payments that powerful farm lobbies can extract from American, European, and Japanese taxpayers, the support of technologically advanced companies or entire industries is an instrument of state power. Thus it is not more and not less than the continuation of the ancient rivalry of the nations by new industrial means. Just as in the past when young men were put in uniform to be marched off in pursuit of schemes of territorial conquest, today taxpayers are persuaded to subsidize schemes of industrial conquest. Instead of fighting each other, France, Germany, and Britain now collaborate to fund Airbus Industrie's offensive against Boeing and McDonnell-Douglas. Instead of measuring progress by how far the fighting front has advanced on the map, it is worldwide market shares for the targeted products that are the goal. (Edward N. Luttwak, *The Endangered American Dream: How to Stop the United States from Becoming a Third-World Country and How to Win the Geo-Economic Struggle for Industrial Supremacy*. New York: Simon & Schuster, 1993, pp. 22-28, 32-33, 34.)

Creation of a New Global Secular Civilization

"The West believes that its destiny is to guide or coerce diverse human cultures into a single global civilization. It cannot tolerate the coexistence in the world of different cultures. The principal reason for this is that the West really is convinced that it has discovered the only model of society which benefits humanity, and

therefore that it has a moral duty to ensure that the whole world adopts that model....

"This acute form of cultural imperialism is reinforced by international business, which considers that it would benefit from the destruction of social diversity and its replacement by a global monoculture hungry for western-type products." (Sir James Goldsmith, *The Trap*, New York: Carroll and Graf Publications, 1994 edition, p. 61.)

Treaty of Maastricht Seeks to Create a Supranational, Centralized, Bureaucratic State

"Maastricht seeks to create a supranational, centralized, bureaucratic state – a homogenized union. It would destroy the pillars on which Europe was built – its nations. It would convert Europe into one multicultural space, in which national identities would be fused and sovereignty abandoned. It would coerce ancient European nations to merge into the ultimate artificial state. As George Orwell remarked, it is characteristic of intellectuals to pass over in incomprehension to the dominant political passion of the age. Today, that passion is the search for national identity. And this is the moment when European ruling elites are seeking to destroy the identity of every European nation....

"The European Union was built in secret: not through carelessness or casualness, but in a deliberately planned and skillfully executed manner. Claude Cheysson, the former French Minister of Foreign Affairs and a member of the European Commission from 1985 to 1989, described the mechanism in an interview in *Le Figaro* on May 1994. He explained proudly that the European Union could only have been constructed in the absence of democracy, and he went on to suggest that the present problems were the result of having mistakenly allowed a public debate on the merits of the Treaty of Maastricht.

"The British newspaper the *Guardian* lodged a case before the European Court of Justice in Luxembourg complaining of the secrecy in which European decisions are taken. Lawyers for the European Council of Ministers responded by stating to the judges that 'there is no principle of community law which gives citizens the right to EU documents'. They went on to make the astounding claim that although heads of government had repeatedly called for more openness in EU affairs, their declarations 'were of an eminently political nature and not binding on the community institutions'. So they asked the judges to ignore the repeated declarations at EU summit meetings in the past two years in favor of greater openness. Statements by the twelve heads of government were no more than 'policy orientations' and had no binding effect.

"This belief that the nomenclature knows best and that the public is no more than a hindrance explains why there now exists a profound and dangerous divorce between European societies and their governing elites....

"Quietly and progressively, power was transferred to the seventeen unelected technocrats who were the members of the European Commission. Originally, power had been entrusted to the Council of Ministers, which consists of the elected national heads of state or their representatives. As they were more interested in national policies than in the creation of Europe, bit by bit the technocrats of the Commission were allowed to take over executive power. They have been granted the monopoly right to propose new initiatives for the development of the European Union. Their ambition is not modest. Jacques Delors, the outgoing president of the Commission, declared that in future 80 percent of all laws governing economic, social and fiscal affairs of each European nation would originate in Brussels and therefore form proposals initiated by the Commission.

"As was certain to be the case, this rush towards a technocratic hypercentralization has created a Europe which is hopelessly weak externally and unable to influence the course of world events. Internally, the power of the technocracy is employed to destroy sovereignty, freedom and self-reliance." (Sir James Goldsmith, *The Trap*, pp.68-70.)

Global Information Warfare in the New World Order

"... [T]he United States is at war, a war that few of us have bothered to notice. The twentieth century information skirmishes, which are the prelude to global Information Warfare, have begun....

"The Cold War is over and has been replaced by economic warfare, a competition between what is shaping up to be three major trading blocks: North America, Europe, and the Asian Pacific Rim. . .

"Information Warfare is an integral component of the new economic and political world order. Economic battles are being fought and will continue to be fought, ultimately affecting every American citizen and company as well as the national security of the United States. As terrorism now invades our shores, we can expect attacks upon not only airliners and water supplies, but upon the money supply, a sure way to strike terror into millions of people with a single keystroke....
"

"Imagine a world where information is the medium of exchange and cash is used only for pedestrian trade. A world where information, not English, German, Japanese, or Russian, is the common language. A world where the power of knowledge and information usurp the strength of military might. A world totally dependent upon new high-tech tools that make information available instantaneously to anyone, anywhere, at any time. A world where he who controls the information controls the people. A world where electronic privacy no longer exists.

"Now imagine a conflict between adversaries in which information is the prize, the spoils of war. A conflict with a winner and a loser. A conflict which turns computers into highly effective offensive weapons. A conflict which defines computers and communications systems as primary targets forced to defend themselves against deadly, invisible bullets and bombs....

"Information Warfare is about money., It's about the acquisition of wealth, and the denial of wealth to competitors. It breeds Information Warriors who battle across the Global Network in a game of cyberrisk.

"Information Warfare is about power. He who controls the information controls the money.

"Information Warfare is about fear. He who controls the information can instill fear in those who want to keep their secrets a secret. It's the fear that the Bank of New York felt when it found itself \$23 billion short of cash in only one day.

"Information Warfare is about arrogance, the arrogance that comes from the belief that one is committing the perfect crime.

"Information Warfare is about politics. When the German government sponsors intelligence agency hacking against U. S. computers, the concept of *ally* needs to be redefined.... "

"Information Warfare is about the control of information. As a society we maintain less and less control as Cyberspace expands and electronic anarchy reigns....

"Much of the New World Order is defined by the efforts by the Second and Third World countries to graduate to First World status. In the most broad terms, that means money, and of course, the money is controlled by a select few. .

"As the world evolves into the New World Order, we must expect entirely new challenges....

"Since 1986 the original twelve members of the European Economic Community (EEC) have been designing a New Europe, one in which trade barriers are removed between all countries, one in which an eventual monetary union will tie independent currencies together, thus lessening the disparity of its members. Western Europe's \$8 trillion GNP and its 340 million people, combined with those from Middle and Eastern Europe, create a single market in excess of 850 million people and an estimated \$12-14 trillion. On the economic front, America will be dwarfed.

"The New Europe is a formidable force that will have profound effects on the U.S. economy, for the rules that the Europeans and the Japanese play by aren't the same ones we use. . .

"Information is what makes both the Old and the New World Order go around. .

"The world's gross national product is about \$27 trillion with the New World Order's bipolar economic superpowers controlling the vast amount of the planet's wealth. The United States generates about twenty-three percent, and Europe about forty percent, depending upon whom you include. A disproportionately low twenty-five percent of the population controls nearly ninety percent of the world's goods, services, and money....

"The \$27 trillion planetary output, though, is dwarfed by a parallel economic system that is only two decades old. Behind the \$27 trillion 'real' economy of goods and services is a hidden, mysterious 'financial' economy that rewards speculation, legalized international hedging and fudging for hundredths of a percentage point gain or loss. The financial economy is between twenty and fifty times as large as the real economy: one quadrillion dollars.

"The hidden financial world of options, futures, and global hedges is a legal and erudite form of gambling. The world's financial economy, in excess of \$1 quadrillion (\$ 1,000 trillion), dwarfs the power of any single country or sphere of influence, and, with the proper incentives, could bankrupt any nation on Earth. Speculation breeds volatility. For every real dollar, speculators manipulate the markets with twenty to fifty financial dollars....

". . . The New York brokerage and trading houses alone pass \$1.9 trillion over their computer networks every single day. That's almost \$800 trillion per year, which doesn't include Tokyo, London, Frankfurt, Hong Kong, or other international trading centers. One New York brokerage house, Solomon Brothers, trades \$2 trillion every year. The Federal Reserve System transfers \$1 trillion every day over the Fed Wire. The world's other networks move another \$2 trillion -plus every day.

"Incredibly vast sums of money, most of it real only in Cyberspace, offer the owners control and power over the destiny of companies, countries, and people.... (Winn Schwartau, *Information Warfare*, New York: Thunder's Mouth Press, 1994, pp. 11, 12, 13, 14, 15, 16, 36, 38-39, 44, 61-64.)

A New Civilization is Emerging

"A new civilization is emerging in our lives, and blind men everywhere are trying to suppress it. This new civilization brings with it new family styles;

changed ways of working, loving, and living; a new economy; new political conflicts; and beyond all this an altered consciousness as well.

"Humanity faces a quantum leap forward. It faces the deepest social upheaval and creative restructuring of all time. Without clearly recognizing it, we are engaged in building a remarkable new civilization from the ground up. This is the meaning of the Third Wave. (Alvin & Heidi Toffler, *Creating a New Civilization: The Politics of the Third Wave*, Washington, D.C.: Progress & Freedom Foundation, 1994, p. 1.)

Free Trade is the Economic Theology of the American Elite and Multinational Corporations

Ever since the Second World War, economists and the American government have trumpeted the benefits of free trade. Various administrations, Democratic as well as Republican, have championed laissez-faire in foreign commerce. Slowly but steadily, most trade barriers have been eliminated, and today American's dependence on international commerce, particularly its addition to imports, is the highest ever in its history.

By now the idea of free trade has acquired a myth of its own. To be for laissez-faire is to be for progress, prosperity, and peace; to be against it is to invite the wrath of economists, Wall Street, political pundits, and much of the press. Baby boomers of the 1950s grew up with the gospel of free trade; in fact, the idea is now embraced as economic theology around the world....

Economists generally sing the melodies of laissez-faire but slight its costs in terms of layoffs, lost wages, and environmental destruction. In the pages that follow I will show you that every country except America has benefits from the policy of free trade. Laissez-faire has wrecked U. S. industry and shattered the American dream....

The experience of most countries show that prosperity lies in the expansion of manufacturing rather than agriculture and services. This is because manufacturing has much higher worker productivity than other sectors, so that its salaries tend to be 150 to 200 percent of those in other areas. When freer trade promotes manufacturing, it raises overall productivity as well as the general standard of living; but when it fosters services at the expense of manufacturing, productivity growth as well as real earnings decline.

Manufacturing, not trade, is the main source of prosperity. And history, recent and past, confirms this resoundingly. It is no secret that ever since the 1970s, services have far outpaced manufacturing in the United States. As a result, the entire economic landscape has been transformed. Trade liberalization turns out to be the main cause of this transformation, which is unprecedented in the American chronicle.

Today only 17 percent of the labor force is employed in the industrial sector, the rest being in services and agriculture. Therefore, it is not surprising that inflation-adjusted wages have declined by 19 percent since 1972, while the volume of trade has doubled and tariffs have plummeted to 5 percent. In retailing, real after-tax earnings now match those of the Great Depression.

Since the 1970s, cheap imports produced by foreign workers, sometimes laboring on pennies per day, have destroyed and even exterminated industry after industry in the United States, while the administrators, both Democrats and Republicans, have stood idly by. It's an open secret that local firms producing steel, cameras, TVs, VCRs, textiles, and shoes, among many others, have fallen prey to imports from Japan, Taiwan, Korea, Singapore, China, and Hong Kong. And despite the anguish of the American poor and unemployed, the flood of imports continues at an alarming pace.

If this trend persists, then by the end of this decade, the American auto industry would be all but extinct; and computers, machine tools, and pharmaceuticals could suffer the same fate. The reason is that when foreign labor is so cheap, no matter how superior American technology is, U. S. industries just can't compete with foreign products. Free trade has done to the United States what Hitler and Imperial Japan could not do during the war.

Despite such clear-cut evidence, why is free trade so popular and protectionism in disrepute? The United States is now in the midst of the longest recession since the war. Yet protectionist forces, which normally thrive in bad times, have found little political or academic support. In spite of so much industrial devastation, why have protectionists so little to show in terms of legislation that would impede the torrent of imports? It's because protectionists have not offered a coherent case. They have ... failed to document the destructive impact of surging imports on the U.S. economy, while free traders have had a great propaganda lobby supported by the multinational firms and American elites

The benefits of protectionism today are not limited to the living standard. Few people realize that international trade is the worst polluter among all economic activities; in fact, trade uses more than twice the amount of energy utilized by equivalent local production. Foreign trade ravages the environment far more than manufacturing, agriculture, and services. . . .

America today stands at a crossroads. The passionate debate stirred up by NAFTA suggests that the proposed accord could make or break the system. With our myriad socioeconomic ills, I feel strongly that the free trade agreement could be the straw that breaks America's back. . . .

The facts are clear, the evidence overwhelming: the great American dream of increased prosperity for each generation lies shattered. In fact, there is even talk of the country sinking into a Third World-type hole, and a vicious circle of poverty.

With the media, politicians, and pundits all in confusion, there is a frantic search for diagnosis and cure. The irony of it all is that as the debate on NAFTA grows, few realize that the real cause of America's unprecedented economic debacle is the policy of free trade. We are about to sink deeper into what is already the quicksand of American industry and earnings. . . .

In the aftermath of the Second World War various U. S. administrations went after trade liberalization with gusto. In 1947, after many rounds of talks, the United States helped forge a global agreement called GATT, or the General Agreement on Tariffs and Trade, whose purpose was to reduce or eliminate barriers that countries have erected against the free international flow of goods and services.

A tariff is a tax imposed on foreign products at the port of entry. The tax raises the prices of foreign goods, discouraging their consumption and import. As a result of GATT large cuts in U. S. tariffs were made in 1947 and 1948, and the average duty fell from 27 percent to 15 percent. New cuts were made following another global agreement called the Kennedy Round, in which tariffs on manufactures were lowered by one third. Another cut occurred after the so-called Tokyo Round of trade negotiations, completed in 1979. Today the average American tariff rate stands at 5 percent.

Such a low tariff rate is unprecedented in U. S. history. Over the past two centuries, tariffs were rarely below 30 percent....

From all this we conclude that in 1973, for the first time ever in the three-century history, the United States became a free trade economy, and has remained so ever since. Thus 1973 was also a watershed year as far as America's foreign commerce is concerned. It is a mere coincidence that oil prices also soared at the time, masking the true significance of that year. Energy prices had surged many times before, but never before had America been a laissez-faire economy. Until 1973 either tariffs were exorbitant or trade was too small to be relevant to the U. S. economy.

Thus, what makes 1973 so unique in the American chronicle is the fundamental shift from a closed stance to an open, free trade state, which forever altered the nature of the economy. Such a shift is monumental, comparable to an earthquake of 8.0 on the Richter scale. It cannot but cause loud reverberations, with echoes in every nook and cranny of society.

What caused this monumental transformation? In the aftermath of the Second World War, the United States emerged as the predominant economy in the world. While England, France Italy, Germany, and Japan lay in a shambles, American manufacturing was at its zenith. Confident that the United States could outcompete all others, the federal government vigorously pursued laissez-faire around the globe. It also offered the Marshall Plan to rebuild Western Europe and assisted

Japan through liberal exports of technology. By every possible measure, America's economic might was unchallenged for two decades after 1945.

However, by the late 1960s, it was evident that the United States had been overly successful in its zeal to rebuild the economies of its trading partners. Both Europe and Japan had emerged to challenge America's dominance in manufacturing. The once formidable U. S. industrial pillars were beginning to crumble. The foreign onslaught was first felt in low-tech industries such as footwear and textiles; then came the turn of radios, televisions, automobiles, motorcycles, refrigerators, air conditioners, generators, turbines, cameras, and numerous other manufactured products in which the Americans had held a near monopoly for two decades.

In the early 1960s, America's retreat was slow, barely perceptible. American workers and businessmen remained smug, complacent, and blind to the emerging challenge that would nearly rout them in the next decade. While the Europeans and Japanese were studying, saving, and investing their way out of the ruins, Americans were becoming lethargic, litigious, and extravagant.... The world conserved and harnessed its energy, while America wasted it with abandon.

Europe and Japan, through grit and perseverance, increasingly exported manufactures to the United States. Sony, Honda, Mercedes-Benz, and Chanel became household names, perhaps more so than RCA, Zenith, General Motors – the American industrial giants that now seem as endangered as pandas. Apparently, the import surge in 1973 was so great that it catapulted the United States into an open economy. As tariffs had already tumbled, the country thus became an open economy with free trade. Since 1973, America's trade dependence, particularly its import addiction, has continued to rise with no end in sight. At present, the average tariff rate is 5 percent, not too far below the 7 percent rate of 1973, and the trade ratio, at 25 percent, is at its all-time high....

Why did the U.S. industrial base erode? The deindustrialization hypothesis blames it mainly on the multinational firms that relocated their facilities to the low-wage countries of Asia. This is a fact. Yet the multinational firms would not have rushed abroad, if they weren't free to import their goods back into the United States. It's the steady drop in American tariffs that encouraged them to invest heavily in Asia. In addition, U. S. corporations encountered faced intense international competition, forcing their emigration to low-wage countries.

If the United States had maintained its historical policy of being a nearly closed economy, there would have been no erosion of U. S. industry. America's laissez-faire policy enabled U. S. multinationals to relocate their factories abroad, produce their goods in low-wage nations, and then freely import those goods back into the United States. In August 1992, Smith-Corona announced the relocation of its typewriter-manufacturing plant to Tijuana, Mexico, and the lay-off of 875 U. S.

workers in the process. Suppose the company were required to pay a hefty duty on typewriter imports; would it move its factory to Mexico? Of course not. The real cause of such plant relocation and the resulting decline in real wages is free trade, nothing else.

As a process explaining the steady erosion of the industrial base, the deindustrialization hypothesis is immaculate. I would, however, restate the thesis in this way. After the United States became a free trade economy in 1973, the rate of manufacturing profit fell to a new low because the industrial relative price began to fall at a higher rate. U. S. corporations responded by accelerating their emigration abroad and by cutting labor demand at the plants remaining at home. This in turn caused a massive loss of high-paying jobs, as many as 38 million by one estimate. Most of the fired workers found employment in low-paying service industries, while a few entered the newly expanding high-tech services, where wages were soaring. To this add the restructuring of industry and the resulting job losses caused by the merger mania of the 1980s, and you have a complete explanation of the systematic decline in the American living standard.

The government neglect of merger mania reveals the total bankruptcy of official economic policy. Trade liberalization is supposed to generate competition between home and foreign producers; but mergers restrict domestic competition as one giant firm gobbles up others. In its wisdom, the government in the 1980s decided that foreign competition was preferable to domestic competition, that foreign predators were more trustworthy than local rivals.

What a bizarre idea! It should be the other way around. Competition is vital for efficiency. It is the cradle of giant productivity gains – but not when it comes from abroad. Given the choice, domestic competition is far better than foreign competition. Government policy was thus, at best, contradictory; at worst, self-destructive.... (Ravi Batra, *The Myth of Free Trade*, New York, N.Y.: Simon & Schuster, 1994, pp. 1, 3-5, 6, 35-36, 41-43, 77-78.)

Nation-States and Political Sovereignty Are No Longer Relevant in the Emerging World Order

"...The forces now at work have raised troubling questions about the relevance – and effectiveness – of nation states as meaningful aggregates in terms of which to think about, much less manage, economic activity. Once-powerful examples of such nation states have come apart at the seams. (At a conference of leading CEOs held in Stuttgart back in 1990, I predicted that the 'global logic' unleashed by these forces would lead to the collapse of the Soviet Union. At the time, no one else in the room believed me.) And many of the core values supporting a world order based on discrete, independent nation states – liberal democracy as practiced in the West, for instance, and even the very notion of political sovereignty itself – have shown themselves in serious need of redefinition or, perhaps, replacement. Indeed,

as the 21st century approaches and as what I call the four 'I's'-industry, investment, individuals, and information – flow relatively unimpeded across national borders, the building-block concepts appropriate to a 19th-century, closed-country model of the world no longer hold....

"...Are these nation states – notwithstanding the obvious and important role they play in world affairs – really the primary actors in today's global economy? Do they provide the best window on that economy? Do they provide the best port of access to it? In a world where economic borders are progressively disappearing, are their arbitrary, historically accidental boundaries genuinely meaningful in economic terms? And if now, what kinds of boundaries do make sense? In other words, exactly what, at bottom, are the natural business units – the sufficient, correctly-sized and scaled aggregations of people and activities – through which to tap into that economy?

"One way to answer these questions is to observe the flows of what I call the 4 'I's' that define it. First, the capital markets in most developed countries are flush with excess cash for investment. Japan, for example, has the equivalent of US \$10 trillion stored away. Even where a country itself hovers close to bankruptcy, there is often a huge accumulation of money in pension funds and life insurance programs. The problem is that suitable – and suitably large – investment opportunities are not often available in the same geographies where this money sits. As a result, the capital markets have developed a wide variety of mechanisms to transfer it across national borders. Today, nearly 10 percent of U. S. pension funds is invested in Asia. Ten years ago, that degree of participation in Asian markets would have been unthinkable.

"Thus, investment – the first 'I' – is no longer geographically constrained. Now, wherever you sit in the world, if the opportunity is attractive, the money will come in. And it will be, for the most part, 'private' money. Again, ten years ago, the flow of cross-border funds was primarily from government to government or from multilateral lending agency to government. There was a capital city and an army of public bureaucrats on at least one end of the transaction. That is no longer the case. Because most of the money now moving across borders is private, governments do not have to be involved at either end. All that matters is the quality of the investment opportunity. The money will go where the good opportunities are.

"...The strategies of modern multinational corporations are no longer shaped and conditioned by reasons of state but, rather, by the desire – and the need – to serve attractive markets wherever they exist and to tap attractive pools of resources wherever they sit.

"...If the unfettered movement of these I's makes the middleman role of nation states obsolete, the qualifications needed to sit at the global table and pull global solutions begin to correspond not to the artificial political borders of countries, but

to the more focused geographical units – Hong Kong, for example, and the adjacent stretch of southern China, or the Kansai region around Osaka, or Catalonia – where real work gets done and real markets flourish. I call these units 'region states.' They may lie entirely within or across the borders of a nation state. This does not matter. It is the irrelevant result of historical accident. What defines them is not the location of their political borders but the fact that they are the right size and scale to be the true, natural business units in today's global economy. Theirs are the borders – and the connections – that matter in a borderless world.

"...I will show why traditional nation states have become unnatural, even impossible, business units in a global economy. I will also show why region states are, in fact, so effective as ports of entry to it...

"...Public debate may still be hostage to the outdated vocabulary of political borders, but the daily realities facing most people in the developed and developing worlds – both as citizens and as consumers – speak a vastly different idiom. Theirs is the language of an increasingly borderless economy, a true global marketplace. But the references we have – the maps and guides – to this new terrain are still largely drawn in political terms. Moreover, as the primary features on this landscape—the traditional nation states – begin to come apart at the seams, the overwhelming temptation is to redraw obsolete, U.N.-style maps to reflect the shifting borders of those states. The temptation is understandable, but the result is pure illusion. No more than the work of early cartographers do these new efforts show the boundaries and linkages that matter in the world now emerging....

"...The glue holding together older constellations of nation-based political interests has visibly begun to wear thin. In economics as in politics, the older patterns of nation-to-nation linkage have begun to lose their dominance. What is emerging in their place, however, is not a set of new channels based on culture instead of nations. Nor is it a simple realignment of previous flows of nation-based trade or investment.

"In my view, what is really at stake is not really which party or policy agenda dominates the apparatus of a nation state's central government. Nor is it the number of new, independent units into which that old center, which has held through the upheavals of industrialization and the agonies of two world wars, is likely to decompose. Nor is it the cultural fault lines along which it is likely to fragment.

"Instead, what we are witnessing is the cumulative effect of fundamental changes in the currents of economic activity around the globe. So powerful have these currents that they have carved out entirely new channels for themselves – channels that owe nothing to the lines of demarcation on traditional political maps. Put simply, in terms of real flows of economic activity, nation states have already lost their role as meaningful units of participation in the global economy of today's borderless world....

"The uncomfortable truth is that, in terms of the global economy, nation states have become little more than bit actors. They may originally have been, in their mercantilist phase, independent, powerfully efficient engines of wealth creation. More recently, however, as the downward-ratcheting logic of electoral politics has placed a death grip on their economies, they have become – first and foremost – remarkably inefficient engines of wealth distribution. Elected political leaders gain and keep power by giving voters what they want, and what they want rarely entails a substantial decrease in the benefits, services, or subsidies handed out by the state....

"Second, and more to the point, the nation state is increasingly a nostalgic fiction. It makes even less sense today, for example, than it did a few years ago to speak of Italy or Russia or China as a single economic unit. Each is a motley combination of territories with vastly different needs and vastly different abilities to contribute....

"...In the borderless economy of an interdependent world, there need not be any such thing as local sovereignty over local difficulties.... " (Kenichi Ohmae, *The End of the Nation State: The Rise of Regional Economies*, New York, Simon and Schuster, 1995, pp. viii, 2-3, 5, 8, 11, 12.)

Internationalists Feel That the United Nation's Charter Is the World's Most Important Political Document

"The Charter of the United Nations was written while the world was still engulfed in war. Their [authors of U.N. Charter] vision produced the world's most important political document.

"The need to work together...guided the visionary men and women who drew up the Charter of the United Nations. What is new today is that the interdependence of nations is wider and deeper.

What is also new is the role of people and the shift of focus from states to people. An aspect of this change is the growth of international civil society.

"These changes call for reforms in the modes of international co-operation – the institutions and processes of global governance.

"The international system that the UN Charter put in place needs to be renewed. The flaws and inadequacies of existing institutions have to be overcome. There is a need to weave a tighter fabric of international norms, expanding the rule of law world-wide and enabling citizens to exert their democratic influence on global processes.

"We also believe the world's arrangements for the conduct of its affairs must be underpinned by certain common values. Ultimately, no organization will work and

no law upheld unless they rest on a foundation made strong by shared values. These values must be informed by a sense of common responsibility for both present and future generations.

"It was Willy Brandt who brought the two of us together as co-chairmen of the Commission on Global Governance....

"The members of the Commission have all served in their personal capacities, and they are from many backgrounds and orientations. Yet, over the last two years together, we have been united by one single desire: to develop a common vision of the way forward for the world in making the transition from the cold war and in managing humanity's journey into the twenty-first century. We believe this report offers such a vision....

"The development of global governance is part of the evolution of human efforts to organize life on the planet, and that process will always be going on. Our work is no more than a transit stop on that journey. We do not presume to offer a blueprint for all time. But we are convinced that it is time for the world to move on from the designs evolved over the centuries and given new form in the establishment of the United Nations nearly fifty years ago. We are in a time that demands freshness and innovation in global governance....

"...This is a time for the international community to be bold, to explore new ideas, to develop new visions, and to demonstrate commitment to values in devising new governance arrangements.

"In the final chapter of this report, we draw attention to what has been a preeminent strand in the thinking of the commission: the world's need for enlightened leadership that can inspire people to acknowledge their responsibilities to each other, and to future generations. It has to be leadership that upholds the values we need to live together as neighbors, and to preserve the neighborhood for those who follow us.

"Many pressures bear on political leaders, as they seek both to be effective and to retain support at the national level. Notwithstanding the drawbacks of nationalism, however, the history of even this century encourages us to believe that from the very best of national leaders can come the very best of internationalism. Today, a sense of internationalism has become a necessary ingredient of sound national policies....

"Removed from the sway of empires and a world of victors and vanquished, released from the constraints of the cold war that so cramped the potential of an evolving global system throughout the post-war era, seized of the risk of unsustainable human impacts on nature, mindful of the global implications of human deprivation – the world has no real option but to rise to the challenge of change, in an enlightened and constructive fashion. We call our global neighbors,

in all their diversity, to act together to ensure this – and to act now." (Ingvar Carlsson, Stockholm, Shrdath Ramphal, London, *Our Global Neighborhood*, New York: Oxford University Press, 1995, pp. xiii-xx.)

The Quest for Short Term Financial Gain by an Elite Few

"Governments seem wholly incapable of responding, and public frustration is turning to rage. It is more than a failure of government bureaucracies, however. It is a crisis of governance born of a convergence of ideological, political, and technological forces behind a process of economic globalization that is shifting power away from governments responsible for the public good and toward a handful of corporations and financial institutions driven by a single imperative – the quest for short-term financial gain. This has concentrated massive economic and political power in the hands of an elite few whose absolute share of the products of a declining pool of natural wealth continues to increase at a substantial rate – thus reassuring them that the system is working perfectly well.

"Those who bear the costs of the system's dysfunctions have been stripped of decision-making power and are held in a state of confusion regarding the cause of their distress by corporate-dominated media that incessantly bombard them with interpretations of the resulting crisis based on the perceptions of the power holders. An active propaganda machinery controlled by the world's largest corporations constantly reassures us that consumerism is the path to happiness, governmental restraint of market excess is the cause of our distress, and economic globalization is both a historical inevitability and a boon to the human species. In fact, these are all myths propagated to justify profligate greed and mask the extent to which the global transformation of human institutions is a consequence of the sophisticated, well-funded, and intentional interventions of a small elite whose money enables them to live in a world of illusion apart from the rest of humanity.

"These forces have transformed once beneficial corporations and financial institutions into instruments of a market tyranny that is extending its reach across the planet like a cancer, colonizing ever more of the planet's living spaces, destroying livelihoods, displacing people, rendering democratic institutions impotent, and feeding on life in an insatiable quest for money. As our economic system has detached from place and gained greater dominance over our democratic institutions, even the world's most powerful corporations have become captives of the forces of a globalized financial system that has delinked the creation of money from the creation of real wealth and rewards extractive over productive investment. The big winners are the corporate raiders who strip sound companies of their assets for short-term gain and the speculators who capitalize on market volatility to extract a private tax from those who are engaged in productive work and investment.

"Faced with pressures to produce greater short-term returns, the world's largest corporations are downsizing to shed people and functions. They are not, however, becoming less powerful. While tightening their control over markets and technology through mergers, acquisitions, and strategic alliances, they are forcing both subcontractors and local communities into a standards-lowering competition with one another to obtain the market access and jobs that global corporations control. The related market forces are deepening our dependence on socially and environmentally destructive technologies that sacrifice our physical, social, environmental, and mental health to corporate profits.

"The problem is not business or the market per se but a badly corrupted global economic system that is gyrating far beyond human control. The dynamics of this system have become so powerful and perverse that it is becoming increasingly difficult for corporate managers to manage in the public interest, no matter how strong their moral values and commitment.

"Driven by the imperative to replicate money, the system treats people as a source of inefficiency and is rapidly shedding them at all system levels...." (David C. Korten, *When Corporations Rule the World*, West Hartford, Conn., Kumarian Press & San Francisco, Berrett-Koehler Publishers, 1995, pp. 12-13.)

The Institutions of Global Governance

"The last half of the twentieth century...saw the creation of the first consequential institutions of global governance: the United Nations, the International Monetary Fund, the World Bank, and the General Agreement on Tariffs and Trade (GATT)...." (David C. Korten, *When Corporations Rule the World*, pp. 17-18.)

Global Economic Integration Being Implemented by GATT

"On the evening of December 1, 1994, a lame-duck session of the U.S. Senate approved GATT by a margin of seventy-six to twenty-four. A broad coalition of Republican and Democratic senators supported the measure in the face of widespread and growing opposition among those Americans familiar with the agreement and the threat it posed to jobs, the environment, and democracy. The strong and unequivocal backing of the agreement by President Bill Clinton and Vice President Albert Gore Jr. further deepened the chasm between them and their core labor and environmental constituencies.

"C-Span, a cable television news channel, held a telephone call-in session following the vote. Doug Harbrecht, the trade editor of *Business Week*, was the guest resource person. As caller after caller phoned in to express outrage at the politicians who voted for the agreement in support of big-money interests and total disregard of the popular will, Harbrecht commented that the pro-GATT position represented impeccable economics but bad politics. As did many of his colleagues,

Harbrecht failed to discriminate between good economics and politically correct free-market ideology. The global economic integration being implemented through GATT is advancing conditions that are at odds with the most basic principles of market economics and is putting in place an economic system that is designed to self-destruct – at an enormous cost to human societies. This can scarcely be considered the practice of good economics." (David C. Korten, *When Corporations Rule the World*, p. 80.)

The Effort to Dismantle National Economies

"The opportunists and demagogues of corporate libertarianism have linked corporate money and power with populist interests to advance an agenda that results in placing corporate interests above human interests. This contradiction remains unexposed as long as the corporate libertarians are allowed to define the issues as a struggle between tax-and-spend big-government liberals and family-values conservatives fighting for individual freedom and responsibility. In this guise, they have enjoyed great success in attacking social programs for the poor, providing tax breaks for the rich, and giving greater freedom to corporations. The consequence is to shift still more power and wealth to the big and central – the corporate world of the cloud mincers – at the expense of the small and local. Ironically, the cause that many conservative voters believe themselves to be serving is that of reclaiming power for the small and local.

"The terms of the political debate must be redefined to focus clearly on the real issue: the contest for power between the big and central and the small and local – between corporations and ordinary people. The time is ripe for a realignment of political alliances, which is likely to come into full flower only when the true populists realize that their enemy is not only big central government but also the giant corporations that owe no allegiance to place, people, or human interest.

"Economic globalization is the foundation on which the empires of the new corporate colonialism are being built. The corporate libertarians tell us that the process of economic globalization is advancing in response to immutable historical forces and that we have no choice but to adapt and learn to compete with our neighbors. It is a disingenuous claim that belies the well-organized, generously funded, and purposeful efforts by the cloud mincers to dismantle national economies and build the institutions of a global market...." (David C. Korten, *When Corporations Rule the World*, pp. 116-117.)

Managing Economic Interdependence

"In the last fifty years, the structure of global economic governance has been extended, repaired, and adapted in the face of enormous technological, economic, and political change....

"While the world has become much more highly integrated economically, the mechanisms for managing the system in a stable, sustainable way have lagged behind. Today's much higher level of economic integration and resulting interdependence are in part due to improved communications....

"The last two years have seen a veritable explosion of portfolio investment by institutional investors – insurance companies, pension funds, unit trusts – in 'emerging markets' as stock markets become truly global in reach. People can trade in the world's leading currencies twenty-four hours a day and use a growing variety of financial instruments. In the field of finance, national frontiers have little meaning; 'the end of geography' is approaching.

"That all this global economic integration has come to pass is in part a tribute to the relative order and stability of post-war economic governance, as well as to new technologies. Enormous opportunities are being created for societies and individuals to advance. But there are also imbalances and risks.

"As economies become more interdependent, it is not only the opportunity for wealth creation that is multiplied, but also the opportunity for destabilizing shocks to be transmitted from one country to another. International co-operation has forestalled or mitigated some shocks (such as action taken after the 1987 stock market crash), but others (the debt crisis of the 1980s, for instance) have been allowed to gather momentum and inflict economic damage and social pain. No satisfactory mechanism exists to anticipate or respond promptly to future global shocks. The International Monetary Fund (IMF), which should be playing a major role in countering destabilizing shocks, is constrained by limited resources." (*Our Global Neighborhood*, Report of the Commission on Global Governance, New York: Oxford University Press, 1995, pp. 135-137.)

A System of Global Governance It is Being Put in Place

"...The Bank for International Settlements (BIS)...provides an underpinning of cooperative supervision. In these quiet, unspectacular ways, a system of global governance is being put in place, albeit on a piecemeal basis." (*Our Global Neighborhood*, Report of the Commission on Global Governance, p. 152.)

G-7 Leaders Control the World Economy

"The Group of Seven [Elite in Canada, United States, England, Germany, France, Italy and Japan] is the nearest the world comes to having an apex body concerned with the global economy." (*Our Global Neighborhood*, p. 154.)

The Evolution of the World Trade Organization

"The World Trade Organization has had a long gestation. An International Trade Organization was first proposed in the US House of Representatives by

Cordell Hull during World War I. The idea was advanced at the World Economic Conference in 1927 and at the Seventh International Conference of American States in Montevideo in 1933.

"In the 1941 Atlantic Charter, President Roosevelt and Prime Minister Churchill proposed a new initiative that would further the access of 'all states, great or small, victor or vanquished,...to the trade and raw materials of the world which are needed for their prosperity'. The first meeting of ECOSOC in 1946 called for a conference on Trade and Employment, and the preparatory committee for that recognized the suggested charter for an International Trade Organization.

"The Havana Conference concluded in 1948 with an agreement between fifty-three countries. The Havana Charter subsumed the General Agreement on Tariffs and Trade signed in October 1947 (which extensively cut trade barriers and discrimination but also dealt with employment development, restrictive barriers, and commodity agreements), and established an International Trade Organization. But the Charter lapsed when the United States failed to ratify it.

"At the conclusion of the Uruguay Round of GATT in 1993, and then finally in Marrakesh in April 1994, the community of nations agreed to establish a World Trade Organization, entering into force on 1 January 1995, to implement the Uruguay Round, provide a forum for negotiations, administer the new mechanisms for dispute settlement and trade policy review, and coordinate with the IMF and the World Bank for greater coherence in global economic policy-making. (*Our Global Neighborhood*, p. 168.)

IMF and IBRD Oversee Worldwide Economic Cooperation

"Fifty years ago, the establishment of the Bretton Woods System created rules for exchange rates and payments, along with two new institutions – the IMF and the World Bank – to oversee economic co-operation." (*Our Global Neighborhood*, p. 179.)

BIS Supervises Global Banking

"Global banking supervision is currently the responsibility of central bankers meeting under the auspices of the Bank for International Settlements in Basle. Their efforts to strengthen the liquidity of banks around the world through capital adequacy ratios have had a far-reaching effect on banking behavior. (*Our Global Neighborhood*, p. 183.)

The IMF Should Manage the Economies of the Nation-States

"...The Fund should play a more active and high-profile role in the surveillance of policy in major economies, including regular, detailed peer reviews of macro-economic policies by members of the international community, both industrial and

developing, although surveillance is already a part of the Fund's mandate, the asymmetrical treatment of borrowing countries is a deep-rooted problem. It can be addressed in part by giving the IMF more effective say in the management of major economies, which would occur if there were at global the same kind of commitment to policy convergence as exists within the EU." (*Our Global Neighborhood*, p. 186.)

A New World It is Taking Shape

"The Commission's terms of reference, adopted at its third meeting in February 1993, are as follows:

"The Commission on Global Governance has been established at a time of profound, rapid and pervasive change in the international system – a time of uncertainty, challenge and opportunity.

"Freed from East-West tensions, the world's nations have more favorable conditions for working together to build a better world for all. The need for cooperation among them has also increased. They have become more interdependent in many respects. New problems have appeared that call for collective action. Global society faces the forces of both integration and division.

"These trends pose fresh challenges to the existing structures of international cooperation. It is therefore necessary to reassess their capacity and the values and concepts that underlie them. It is time to review the arrangements for the governance of our global society.

"Five decades after World War II and in the aftermath of the Cold War, a new world is taking shape. It could give new meaning to the common rights and responsibilities of nations, peoples and individuals. It could bring greater peace, freedom and prosperity. The Commission has been established to contribute to the emergence of such a global order....

"Despite greatly expanded international cooperation, global and regional institutions have not been able to keep pace with the challenges of increasing interdependence. At all levels, there is a gap between the demands of individuals, peoples and nations and the capacity of the system to meet their needs. In a world turning into a global village, the rights and responsibilities of its different actors must be redefined – and respected – as we move towards a new global democracy.

"The Commission's basic aim is to contribute to the improvement of global governance. It will analyze the main forces of global change, examine the major issues facing the world community, assess the adequacy of global institutional arrangements and suggest how they should be reformed or strengthened.

"The Commission will be able to draw on the work of the previous independent commissions chaired by Willy Brandt, Olof Palme, Sadruddin Aga Khan and Hassan bin Talal, Gro Harlem Brundtland, and Julius Nyerere. These contributed to a better understanding of policies and measures necessary to address key issues in important fields: North-South relations, security and disarmament, humanitarian questions, environment and development, and the progress of the developing countries.

"The Commission does not have to go over the same ground, but will examine their proposals for continuing relevance and consider how their acceptability may be enhanced. It will explore what factors may have caused past efforts to improve global governance to fail – and what conditions helped them succeed. The Commission will suggest how global, regional and national institutions should be developed to better support cooperation in today's world.

"The principal challenge will be mobilize political will for multilateral action. Attitudes must be fostered that enable enduring collaborative solutions to global problems to be put into effect. The political and economic arguments for action in the common good need to be well marshalled. It will be the Commission's task to articulate a vision of global cooperation that may inspire nations – leaders and people – to intensify their collective endeavors....

"...The Commission will need to examine what the world community may set down as the limits of permissible behavior in a range of areas, and consider mechanisms – in the context of a future regime of international law – to encourage and, if necessary, enforce compliance with these norms.

"The values upheld by the international community must be reinforced by the regulatory framework of the global rule of law. As sovereign states remain the primary units of the international system, the changing nature of state sovereignty and the relationship between national autonomy and international responsibility will be germane to the work of the Commission.

"Together with the worldwide movement towards participatory democracy, there has been greater attention to the rights of individuals and minorities, and to the role of civil society and its voluntary organizations in advancing the people's interest....

"The economic turbulence of recent times calls for renewed efforts to improve coordination in policy in the interests of achieving more stable conditions for investment and growth worldwide. There is also a need for nations to ensure that progress towards multilateral free trade is maintained. These issues will receive the Commission's attention....

"Another important concern will be the environment, with its close links to development and population growth. Both affluence and poverty contribute to

environmental stress, and so does population pressure which often accompanies poverty. Grave environmental problems beyond national remedy, such as greenhouse warming, ozone depletion and, in some cases, natural disasters, have linked the fate of nations more closely together. They call for cooperative strategies based on the principle of equitably shared responsibility. Such strategies must be responsive to a common danger and be guided by concern for the interests of future generations, in order to promote sustainable development on a global basis.

"The Commission will consider how the limited progress made at the Earth Summit of June 1992 can be consolidated and extended, and how recognition of the interdependence of the human family, signalled by ecological dangers, can be widened so as to evoke greater international support for sustainable development.

"An extensive system of international cooperation has been built up over the past fifty years. With the United Nations at its center, the system has an array of important organizations.

"However, these institutions of global governance – mainly created for a much less complex world with far fewer nations – fall short of today's demands. In many cases, current arrangements inhibit the development of an improved system of global security and the advancement of the human condition. A key objective of the Commission will be to propose how an adequate international institutional framework can be achieved." (Our Global Neighborhood, pp. 366-370.)

The Emerging Global Order is Being Spearheaded By a Few Hundred Corporate Giants

"The emerging global order is spearheaded by a few hundred corporate giants, many of them bigger than most sovereign nations. Ford's economy is larger than Saudi Arabia's and Norway's. Philip Morris's annual sales exceed New Zealand's gross domestic product. The multinational corporation of twenty years ago carried on separate operations in many different countries and tailored its operations to local conditions. In the 1990s large business enterprises, even some smaller ones, have the technological means and strategic vision to burst old limits – of time, space, national boundaries, language, custom, and ideology. By acquiring earth-spanning technologies, by developing products that can be produced anywhere and sold everywhere, by spreading channels of communication that can penetrate any village or neighborhood, these institutions we normally think of as economic rather than political, private rather than public, are becoming the world empires of the twenty-first century. The architects and managers of these space-age business enterprises understand that the balance of power in world politics has shifted in recent years from territorially bound governments to companies that can roam the world. As the hopes and pretensions of government shrink almost everywhere, these imperial corporations are occupying public space and exerting a more

profound influence over the lives of every larger numbers of people...." (Richard J. Barnet & John Cavanagh, *Global Dreams: Imperial Corporations and the New World Order*, New York: Touchstone, 1995, p. 14.)

The Four Intersecting Webs of the New World Economy

"A relatively few companies with worldwide connections dominate the four intersecting webs of global commercial activity on which the new world economy largely rests: the Global Cultural Bazaar; the Global Shopping Mall; the Global Workplace; and the Global Financial Network.

"These worldwide webs of economic activity have already achieved a degree of global integration never before achieved by any world empire or nation-state. The driving force behind each of them can be traced to the same few hundred corporate giants with headquarters in the United States, Japan, Germany, France, Switzerland, the Netherlands, and the United Kingdom. The combined assets of the top 300 firms now make up roughly a quarter of the productive assets of the world.

"The Global Cultural Bazaar is the newest of global webs, and the most nearly universal in its reach. Films, television, radio, music, magazines, T-shirts, games, toys, and theme parks are the media for disseminating global images and spreading global dreams....

"Even in culturally conservative societies in what we still call the Third World the dinner hour is falling victim to television.... As in the United States, Europe, and Japan, centuries-old ways of life are disappearing under the spell of advanced communication technology...

"The Global Shopping Mall is a planetary supermarket with a dazzling spread of things to eat, drink, wear and enjoy.... Dreams of affluent living are communicated to the farthest reaches of the globe, but only a minority of the people in the world can afford to shop at the Mall. Of the 5.4 billion people on earth, almost 3.6 billion have neither cash nor credit to buy much of anything. A majority of people on the planet are at most window-shoppers....

"The Global Workplace is a network of factories, workshops, law offices, hospitals, restaurants, and all sorts of other places where goods are produced, information is processed, and services of every description are rendered....

"The Global Financial Network is a constantly changing maze of currency transactions, global securities, MasterCard, euroyen, swaps, ruffs, and an ever more innovative array of speculative devices for repacking and reselling money. This network is much closer to a chain of gambling casinos than to the dull gray banks of yesteryear. Twenty-four hours a day, trillions of dollars flow through the world's major foreign-exchange markets as bits of data traveling at split-second speed. No more than 10 percent of this staggering sum has anything to do with

trade in goods and services. International traffic in money has become and end in itself, a highly profitable game..." (Richard J. Barnet & John Cavanagh, *Global Dreams*, pp. 15-17.)

Global Corporations Are Undermining the National Sovereignty of the Nation-State

"The most disturbing aspect of this [international] system is that the formidable power and mobility of global corporations are undermining the effectiveness of national governments to carry out essential policies on behalf of their people. Leaders of nation-states are losing much of the control over their own territory they once had. More and more, they must conform to the demands of the outside world because the outsiders are already inside the gates. Business enterprises that routinely operate across borders are linking far-flung pieces of territory into a new world economy that bypasses all sorts of established political arrangements and conventions..."

"An extraordinary global machine has been developed to make, sell, and service commodities and to render all manner of services.... The modern nation-state... looks more and more like an institution of a bygone age. In much of Asia, Africa, and Latin America, the state is collapsing under the weight of debt, bloated bureaucracy, and corruption.... [T]he economic health of the United States has become increasingly at the mercy of decisions of foreign corporations, banks, governments, and investors.... [T]he nation-state everywhere faces a crisis of redefinition...." (Richard J. Barnet & John Cavanagh, *Global Dreams*, pp. 19-20.)

World Trade and Investment in the Advanced Countries

"Almost four-fifths of the measured economic activity on earth is still generated by two dozen richer countries: the United States, Canada, Japan, Australia, New Zealand, South Africa, and the Nations of Western Europe. All but a handful of the world's top 200 corporations are based here. Most of the world trade and investment takes place within this collection of nations." (Richard J. Barnet & John Cavanagh, *Global Dreams*, p. 282.)

The Eurodollar Was Invented to Accommodate Communist China

"The concept of Eurodollars – U. S. currency held by banks abroad – was an invention to accommodate the government of communist China. Since the dollar was and remains the world's reserve currency and the primary exchange medium in foreign trade, the Chinese could not do without dollars. Fearing that the Truman administration would seize their assets in the United States, the new Chinese government consolidated its dollar accounts in one U. S. bank and then ordered the funds transferred to a Soviet-owned bank in Paris. Until the 1960s, as Paul Einzig, author of an early study of the Euromarket, has written, 'The Eurodollar market was for years hidden....' Concerned that they would be criticized for being bankers

to the communists or, worse, that loose talk would draw competitors into a profitable business they wanted to keep for themselves, bankers refused to talk about the booming secret money market." (Richard J. Barnet & John Cavanagh, *Global Dreams*, p. 365.)

Citicorp Helps Super-Rich to Remove Over \$100 Billion from Third World Nations

"Thanks to the huge rise in oil prices beginning in 1973, the oil-producing nations, most of them in the Middle East, were sitting on hundreds of billions of dollars, much of which they deposited in U.S. banks. The largest of these deposits were at Citi. [Walter] Wriston [Chairman & CEO] believed that recycling the 'petrodollars' as loans to other governments was surefire way to make big profits. Other governments around the world were forced to borrow large sums to import the expensive oil, or even to stay afloat as prices of everything rose everywhere. As the Citicorp CEO kept repeating until the day he left office, the chances of the bank's losing the money were small. 'Countries don't go broke.'

"All during the 1970s Citi was earning record profits on its loans to foreign governments, quasi-governmental enterprises in Latin America and Asia, and private entrepreneurs. The bank lent several hundred million dollars to the Chilean dictatorship of Augusto Pinochet, and by 1987 Citibank's exposure in Chile was about \$500 million. As with many other loans, a portion of this sum was guaranteed by the U.S. government's Export-Import Bank, in effect by U.S. taxpayers, but most of the debt was not guaranteed other than by the financially shaky sovereign states themselves....

"Now in the mid-1980s history seemed to be repeating itself. During the Wriston era Citicorp had been earning almost half of its profits from its Third World operations. Even more than in the 1920s Citi was the undisputed leader of the herd of banks that had descended on poor countries around the world. But trouble began in the late 1970s. High interest rates, falling prices of minerals and other natural products on which underdeveloped countries depended for export earnings, and a worldwide economic slowdown brought a number of countries to the point where their indebtedness approached or even exceeded their entire gross domestic products, and they were out of foreign exchange. They were, Walter Wriston to the contrary notwithstanding, 'broke,' at least that is what they said and that is how they looked. To the delight of the large cast of characters in the financial world who had felt the sting of a Wriston barb over the years, the philosopher-banker had been exposed, his bank considerably more so.

"To make matters worse for the debtor countries, between 1979 and 1982 well over \$100 billion in capital fled the Third World, and this flight continued throughout the decade. But in the short run this was hardly bad news for Citi. Because it had become a financial supermarket, the bank was able to help people

with money protect themselves from the improvidence of their governments. Even as Citi's loan pushers continued to visit government offices of insolvent countries, Citi's private bankers were arranging for the transfer of billions in personal and corporate funds from the same financial disaster areas to the safety of a Citi account in the United States or elsewhere. While Brazilian, Mexican, and Argentine business and professional people stockpiled dollars in suitcases under the bed to hedge against their own falling currency, Citi, according to the former bank economist James S. Henry, was intent on helping the superrich preserve their assets by getting them out of the country.

"The bank assembled a list of 'global elite' made up of 'the 5000 or so people around the world who are supposed to have individual net worths greater than \$100 million.' American Express was courting the same select group of Paraguayans, Bolivians, and Argentineans by offering its Black Card, 'the ultra VIP credit card that has a credit line of \$500,000 and offers services such as private planes, bodyguards, and access to Fifth Avenue stores in the wee hours of the morning for "solo shopping."' But Citi was the most aggressive facilitator of the exodus of capital from shaky Latin American economies thanks to its worldwide private banking network. 'The problem is not that Latin Americans don't have assets,' a member of the Federal Reserve Board remarked in the mid-1980s. 'They do. The problem is, they're all in Miami.' Henry calculates that in 1984 Mexican funds in U.S. banks exceeded the amount Mexico owed U.S. banks by somewhere between \$40 to \$60 billion.

"As the tumultuous 1970s ended, over forty developing countries including all the major Latin American borrowers, were in arrears on debt-service payments to private banks. Finally, in the summer of 1982, Mexican officials traveled to Washington to announce that they were insolvent, and dozens of other governments declared themselves broke. The lending bonanza was renamed the Third World debt crisis. By 1985 Citibank had \$15 billion in Third World loans on its books, more than \$10 billion of which was owed by five financially strapped Latin American countries with neither the wherewithal to pay it back nor the intention of doing so.... (Richard J. Barnet & John Cavanagh, *Global Dreams*, pp. 368-371.)

Third World Nations Are Yoked with Crushing Debt

"Nevertheless, by the end of the 1980s the Third world debt crisis appeared to be over, at least as far as the banks were concerned. Banks quietly began to swap the debt of various countries at discount rates, and a new profitable global market was created. On a given day in the late 1980s a bank could buy \$100 million in Mexican loans for \$50 million in cash and then trade the Mexican paper for \$60 million in Argentine paper, and so on. Citi and its competitors found that they could swap debt instruments of doubtful value for promising equity investments in Brazil, Chile, Argentina, and other places. Citi became the largest debt-equity

investor, swapping loans for stock in Chilean paper companies, Mexican industrial conglomerates, and Brazilian electronics companies.

"In defusing the debt crisis in this way the foreign banks were able to build up global networks of productive assets. As the ideology of free trade spread across Latin America, spurred by the end of the Cold War, industries that had been off-limits to foreign corporations, such as communications and financial services, could now be bought at bargain prices in exchange for wiping away debts. By 1989 Federal Deposit Insurance Corporation chairman William Seidman was able to report to Congress that the nine banks with the greatest exposure in Third World debt could 'write off 100 percent of their outstanding loans' to the largest debtor countries and 'remain solvent.' However, all the major debtor nations still faced dire economic problems. By the end of the 1980s underdeveloped countries were paying about \$50 billion a year more in debt service to global banks and governments than they were receiving in new loans, a reverse Marshall Plan of sorts.

"The Third World debt crisis was often described in the press as a morality play, a story of greed, corruption, naivete, and unbankerlike behavior. But the drama had a surprise ending. The rashness of the banks and their success in yoking the Third World to a loan of crushing debt did not produce the collapse of the global financial system some pundits had predicted. Walter Wriston, it turned out, was right. The countries all had resources of one sort or another to keep going, the most important of which was the determination of governments in the developed world and of global banks to keep insolvent countries in business. All this helped the debt crisis to disappear from the front pages while the crushing consequences continued to be felt by millions of people squeezed by the austerity programs imposed upon the debtor nations. The main reason people stopped talking about the crisis in the rich countries was that the banks had sold enough of their dubious loans or converted enough of them into long-term bonds or equity investments to appear solvent once again...." (Richard J. Barnett & John Cavanaugh, *Global Dreams*, pp. 372-373.)

U.S. Government Saves Citibank to Prevent a Run on the Bank

"In 1982 Congress had passed a major piece of legislation for the further deregulation of banks and thrifts known as the Garn-St. Germain Act. One of its provisions eliminated banking regulations that had restricted their investment in commercial real estate. Spurred by bullish 1980s talk about how the information revolution would fill towering office buildings all over the country with an ever-expanding supply of lawyers, accountants, brokers, and deal-makers and by generous tax-abatement packages offered by local governments, banks across the country invested more than \$350 billion in real estate. Of all the office space in the United States, 32 percent was built in the 1980s, and much of it still lies empty.

"It was official lore at Citi headquarters that, just as countries never go broke, real-estate values never go down. By 1991 Citi had the largest real-estate portfolio of any U.S. bank, \$13.3 billion, and almost a third of this figure was made up of loans that would almost certainly never be paid back. The failures were there for all to see. In 1987 developers broke ground and erected a gleaming green-glass 42-story tower at 1540 Broadway financed by Citi. The real-estate market in New York City promptly collapsed after the stock-market crash in October of that year and the building remained vacant for years. (This is the building Bertelsmann bought at a great bargain for its U.S. headquarters.) Citi was also overextended in the residential real-estate market. In the boom years the bank had run ads promising to approve loans in fifteen minutes. By September 1990 its defaults on mortgage payments were five times as high as the nationwide delinquency rate, as reported by the Mortgage Bankers Association.

"[John] Reed [Chairman & CEO], who prided himself on his knowledge of sophisticated information technology, and made matters worse by making a serious strategic miscalculation. He purchased Quotron, an electronic stock-quotation-information system; like his predecessor, he believed that in the age of global banking selling rapid information about money is the key to making money. But Quotron's customers were brokers and managers of other financial institutions. Citi was a competitor they saw no reason to patronize, and Quotron lost 40 percent of its customers; the net loss for Citi was another \$1 billion.

"Another profitable idea that has since been successfully developed by others turned sour for Citi. The bank was a pioneer in gathering consumer data by wiring cash registers to a national data base. The Reward America program recorded every purchase made at grocery-store checkout counters for a group of selected products. Consumers were rewarded with rebates, but their names were sold to direct-marketing organizations. Citicorp made the tactical error of demanding that grocers pay for the data generated at their own cash registers, and they were infuriated by Citicorp's arrogance and foggy notions about how grocery stores actually work. By the end of the 1980s the project was as good as dead; another 174 pink slips were put into mailboxes. Meanwhile other entrepreneurs, appreciative they said for the opportunity to learn from Citi's mistakes, were doing well in the consumer-data-gathering business.

"At the end of the decade John Reed seemed more like Job than Michelangelo. Day after day there was a stream of bad news from many fronts. Nine of the ten largest banks in Texas had gone under because of the same sort of disastrous commercial-real-estate loans that had so attracted the chairman of Citicorp. John Dingell, a powerful Michigan congressman on the House Banking Committee, declared the bank to be 'technically insolvent,' and the next day there was a run on the bank's Hong Kong branch. Citicorp stock dived. J.P. Morgan ran pointed ads aimed at the \$5-million-and-up market about 'the security of your assets,' and in addition to luring some of Citi's private investors, Morgan and other competitors

also cut into Citi's share of the 'swaps' market. Corporations wondered whether it was any longer prudent to count on a long-term relationship with the nation's largest bank. Even the good news was embarrassing. A 36-year-old Saudi Arabian prince by the name of Alwaleed bin Talal bin Abdulaziz al Saud became Citi's largest stockholder with a welcome infusion of nearly \$800 million and a warning that he would keep his eye on management, which he said, had 'to be more in touch with reality....' Eyebrows were raised. It was one thing for Moses Taylor or James Stillman to own America's premier bank, but a Saudi prince? Critics broke into print with elaborate (and exaggerated) calculations on how Citi had been taken.

"In November 1990 John Reed was summoned to a secret meeting by the president of the New York Federal Reserve Bank and the director of the Fed's division of bank supervision in Washington and informed that he would now have a partner in all important decisions affecting the future of the bank: the federal government. Then for two and a half years the Federal Reserve, the American version of a central bank, and the Office of the Comptroller of the Currency literally moved in. Reed was required to attend monthly meetings with the regulators at which mounting pressure was exerted on him to cut costs, slash dividends, fire staff, and unload investments to build up cash reserves. Ironically, Citi's international business, which had been its salvation at so many points in its history, was now regarded in one important respect as a vulnerability. A significant share of Citi's funds were in large overseas corporate deposits not protected by federal deposit insurance, and the Fed feared that nervous depositors might withdraw these funds and precipitate a crisis. At one point there were more than 300 bank examiners going over Citibank's books. In August 1992 the regulators turned up the pressure and issued a memorandum of understanding that amounted to a formal reprimand of Citi's management for not moving fast enough.

"Reed was now under fire from three directions. Investors had driven the stock down to \$8.50. The board of directors, it was widely reported, was getting ready to fire him. The regulators were demanding more draconian measures. At a board meeting in Mexico City Reed persuaded the directors to hang in with him. He then cut the dividend almost by half, and over the next year and a half he replaced five of his six top executives and cut 11,000 jobs. By the end of 1992 Citi had recovered enough to convince investors to pay \$30 for the stock. Reed's job (and his \$2.2-million annual compensation package) seemed safe. Ironically, the U.S. bank that had done more than any other to escape federal regulators had been saved by Uncle Sam.

"As Citibank officials bet the future of the bank more and more on the financing of consumption rather than on the financing of production, they are counting on governments everywhere to abandon their old-fashioned Benjamin Franklin outlook on the world and give a green light to heavy consumer debt. The success of the Global Shopping Mall, depends upon the expansion of consumer credit

across the world.... (Richard J. Barnet & John Cavanagh, *Global Dreams*, pp. 380-383.)

The Japanese Invest Billions of Dollars in the U.S. and Throughout the World

"...By 1989 the thirteen largest Japanese banks were capitalized at \$500 billion, more than five times the value of the fifty largest U.S.-based banks. These bulging coffers contributed to the low cost of capital for Japanese corporations. U.S. banks had to pay almost twice as much for the money they lent. In the mid-1980s the Ministry of Finance began urging Japanese financial institutions to put their mammoth accumulations of surplus cash to work outside the country to minimize the domestic inflationary impact of Japan's commercial success. Fortunately for Japan, the world's second-largest economy found itself flush with cash at an historical moment when almost anything anywhere in the world could be bought. Neither pride, or national-security worries nor fame nor long tradition could prevail against the new power of money.

"The results of prodding the Japanese into world financial markets and simultaneously devaluing the dollar were substantial:

- By 1992, eight of the world's top ten banks, ranked by assets, were all Japanese; Citibank was the world's twentieth.

- By 1989 Japanese banks held almost 11 percent of U.S. banking assets, up from 2.3 percent in 1974.

- Between 1981 and 1989 Japanese banks increased their share of the assets of the world's top 100 banks from 25 to 46 percent, while the share of U.S. banks fell from 15 percent to 6 percent.

- By 1989 Japanese banks were providing 20 percent of all credit in California.

- By 1988 Nomura Securities, with twenty times the capital of Merrill Lynch, the largest U.S. brokerage house, bought a 20-percent share of Wasserstein & Perella, the leading merger-and-acquisition broker. Nikko Securities purchased 20 percent of the Blackstone Group. Sumitomo Bank bought a significant interest in Goldman Sachs, Nippon Life a substantial share of Shearson Lehman, and Yasuda Mutual Life a major minority position in Paine-Webber. (Richard J. Barnet & John Cavanagh, *Global Dreams*, pp. 405-406.)

Japanese Investors Buy \$90 Billion Worth of U. S. Government Debt

"Every three months the U. S. Treasury holds a global auction of long-term and short-term Treasury bills. Between 1984 and the end of the Reagan Administration, Japanese securities firms were the best customers in the world for the highly prized obligations of the United States, still regarded as the world's most stable society

and the best credit risk on earth. At one auction in 1986 Japanese investors bought 80 percent of the issue. As Daniel Burstein observes, 'If Japanese investors hadn't bought \$90 billion worth of U. S. government debt in 1986, the U.S. budget deficit would have intruded painfully on American life in forms ranging from sharply higher mortgage rates to higher taxes and deeper, more socially divisive cuts in government programs.' (Richard J. Barnet & John Cavanagh, *Global Dreams*, p. 406.)

U.S. Government Owes Private Investors Nearly \$3 Trillion Dollars

"Every day an estimated \$150 billion in U. S. government bonds change hands across a global computerized trading network that virtually never stops. By late 1992, the U. S. government owed \$2.7 trillion in Treasury obligations to private investors – 17 percent of these bondholders were outside the United States – and another \$1 trillion to itself, that is, the bonds were held by federal-government agencies. Since the nongovernmental bondholders are free at any time to sell millions of dollars of long-term U. S. securities literally in seconds, they hold enormous power over the economic decisions of any president." (Richard J. Barnet & John Cavanagh, *Global Dreams*, p. 408.)

The United States Has Lost Its Political Autonomy and Sovereignty

"For the United States, as for every other country, the price of economic integration has been a loss of political autonomy. For years managers of the U. S. economy assumed because America was the flagship of the world economy, indeed the printer and prime manager of the world's reserve currency, the country was relatively free to tune its own economy by raising and lowering taxes and adjusting interest rates. But by 1990 crucial decisions that were traditionally the exclusive province of the president and the Federal Reserve Board were now held hostage to international pressures. (Richard J. Barnet & John Cavanagh, *Global Dreams*, p. 408.)

Bankers Make Imprudent Loans Knowing that U.S. Taxpayers Will Bail Them Out

"Several months before the 1992 election Roger J. Vaughan and Edward W. Hill published a detailed study of the financial health of commercial banks in the United States. They reported that there were 2,000 'troubled banks' in the nation, that 1,200 of them would fail or be forced by regulators into mergers, and that at the heart of the banking crisis were '14 banking holding companies each with more than \$10 billion in assets.' Were their portfolios given 'honest market valuations,' all would show a negative net worth. Although only about 10 percent of commercial banks were in serious difficulty, these included some of the biggest. In 1992 Congress passed a law requiring federal regulators to take over failing banks once their losses reached a certain point. As Bill Clinton took office, he faced the

prospect of having to preside over a rescue mission for the nation's failing commercial banks on a scale approaching that of the savings-and-loan bailout.

"How and why the United States was faced with a string of bank failures beyond anything experienced since the early 1930s is a tangled tale with many subplots. Bankers with tens of billions of other people's money to lend, impelled by the large fees to be made by lending large sums, piled up an unprecedented number of imprudent loans, knowing that the federal government would ultimately pay off their depositors if the loans turned sour.... (Richard J. Barnet & John Cavanagh, *Global Dreams*, p. 409.)

The Money of U.S. Depositors It is Being Placed in Speculative Global Securities

"Banks play two important but distinct economic roles in shaping society. One is to meet the credit needs of large business enterprises. The other is to lend money to the millions of small depositors from whom banks raise capital.... Private local banks financed thousands of small businesses, which employ well over half of the work force in the private sector.

"But in the last twenty years the allure of quick profits in distant markets and the press of global competition have undercut the two functions that the U.S. banking system was created to serve. Debt relief for Donald Trump's casinos is on the scale accorded debtor nations, but the banking system seldom facilitates the financing of long-term investment to expand employment. The money of local depositors is being sucked into speculative global securities and away from local communities badly in need of financing for housing, small business, and local services. Family farms face a severe credit crisis and great numbers of foreclosures and bankruptcies continue across the country. First-time home owners, low-income families unable to afford mortgages at market rates, and small businesses have also been hit hard. Who can get credit and who cannot is a critical determinant of social and political development. What banks do or refuse to do has considerable influence on how a society functions and what a nation looks like. If there is no adequate credit for affordable housing or for small business, the predictable consequences are homelessness, racial tensions, and unemployment. (Richard J. Barnet & John Cavanagh, *Global Dreams*, pp. 414-415.)

Future Scenarios for the World

"History is not over. Nor are we arrived in the wondrous land of techne promised by the futurologists. The collapse of state communism has not delivered people to a safe democratic haven, and the past, fratricide and civil discord perduring, still clouds the horizon just behind us. Those who look back see all of the horrors of the ancient slaughterbench reenacted in disintegral nations like Bosnia, Sri Lanka, Ossetia, and Rwanda and they declare that nothing has changed. Those who look forward prophesize commercial and technological

interdependence – a virtual paradise made possible by spreading markets and global technology – and they proclaim that everything is or soon will be different. The rival observers seem to consult different almanacs drawn from the libraries of contrarian planets....

"The first scenario rooted in race holds out the grim prospect of a retribalization of large swaths of humankind by war and bloodshed: a threatened balkanization of nation-states in which culture is pitted against culture, people against people, tribe against tribe, a Jihad in the name of a hundred narrowly conceived faiths against every kind of interdependence, every kind of artificial social cooperation and mutuality: against technology, against pop culture, and against integrated markets; against modernity itself as well as the future in which modernity issues. The second paints that future in shimmering pastels, a busy portrait of onrushing economic, technological, and ecological forces that demand integration and uniformity and that mesmerize peoples everywhere with fast music, fast computers, and fast food – MTV, Macintosh, and McDonald's – pressing nations into one homogenous global theme park, one McWorld tied together by communications, information, entertainment, and commerce. Caught between Babel and Disneyland, the planet is falling precipitously apart and coming reluctantly together at the very same moment....

"We are compelled to choose between what passes as 'the twilight of sovereignty' and an entropic end of all history; or a return to the past's most fractious and demoralizing discord; to 'the menace of global anarchy,' to Milton's capital of hell, Pandaemonium, to a world totally 'out of control.'

"The apparent truth, which speaks to the paradox at the core of this book, is that the tendencies of both Jihad *and* McWorld are at work, both visible sometimes in the same country at the very same instant....

"I want, however, to do more than dress up the central paradox of human history in modern clothes. It is not Jihad and McWorld but the relationship between them that most interests me. For, squeezed between their opposing forces, the world has been sent spinning out of control. Can it be that what Jihad and McWorld have in common is anarchy: the absence of common will and that conscious and collective human control under the guidance of law we call democracy?....

"What then does it mean in concrete terms to view Jihad and McWorld dialectically when the tendencies of the two sets of forces initially appear so intractably antithetical? After all, Jihad and McWorld operate with equal strength in opposite directions, the one driven by parochial hatreds, the other by universalizing markets, the one re-creating ancient subnational and ethnic borders from within, the other making national borders porous from without. Yet Jihad and McWorld have this in common: they both make war on the sovereign nation-state

and thus undermine the nation-state's democratic institutions. Each eschews civil society and belittles democratic citizenship, neither seeks alternative democratic institutions. Their common thread is indifference to civil liberty....

"In the tumult of the confrontation between global commerce and parochial ethnicity, the virtues of the democratic nation are lost and the instrumentalities by which it permitted peoples to transform themselves into nations and seize sovereign power in the name of liberty and the commonweal are put at risk. Neither Jihad nor McWorld aspires to resecure the civic virtues undermined by its denationalizing practices; neither global markets nor blood communities service public goods or pursue equality and justice. Impartial judiciaries and deliberative assemblies play no role in the roving killer bands that speak on behalf of newly liberated 'peoples,' and such democratic institutions have at best only marginal influence on the roving multinational corporations that speak on behalf of newly liberated markets. Jihad pursues a bloody politics of identity, McWorld a bloodless economics of profit. Belonging by default to McWorld, everyone is a consumer; seeking a repository for identity, everyone belongs to some tribe. But no one is a citizen. Without citizens, how can there be democracy?...

"Ecological interdependence is, however, reactive: a consequence of natural forces we cannot predict or fully control. But McWorld's interdependence and the limits it places on sovereignty is more a matter of positive economic forces that have globalism as their conscious object. It is these economic and commercial forces – the latest round in capitalism's long-standing search for world markets and global consumers – that are the primary subject of this book.

"Every demarcated national economy and every kind of public good is today vulnerable to the inroads of transnational commerce. Markets abhor frontiers as nature abhors a vacuum. Within their expansive and permeable domains, interests are private, trade is free, currencies are convertible, access to banking is open, contracts are enforceable (the state's sole legitimate economic function), and the laws of production and consumption are sovereign, trumping the laws of legislatures and courts. In Europe, Asia, and the Americas such markets have already eroded national sovereignty and given birth to a new class of institutions – international banks, trade associations, transnational lobbies like OPEC, world news services like CNN and the BBC, and multinational corporations – institutions that lack distinctive national identities and neither reflect nor respect nationhood as an organizing or a regulative principle. While mills and factories sit somewhere on sovereign territory under the eye and potential regulation of nation-states, currency markets and the Internet exist everywhere, but nowhere in particular. Without an address or a national affiliation, they are altogether beyond the devices of sovereignty".

"...Capitalists may be democrats but capitalism does not need or entail democracy. And capitalism certainly does not need the nation-state that has been democracy's most promising host.

"...Moralists used to complain that international law was impotent in curbing the injustices of nation-states, but it has shown even less capacity to rein in markets that, after all, do not even have an address to which subpoenas can be sent. As the product of a host of individual choices or singular corporate acts, markets offer no collective responsibility. Yet responsibility is the first obligation of both citizens and civic institutions.

"While they produce neither common interests nor common law, common markets do demand, along with a common currency, a common language; moreover, they produce common behaviors of the kind bred by cosmopolitan city life everywhere. Commercial pilots, computer programmers, film directors, international bankers, media specialists, oil riggers, entertainment celebrities, ecology experts, movie producers, demographers, accountants, professors, lawyers, athletes – these compose a new breed of men and women for whom religion, culture, and ethnic nationality are marginal elements in a working identity....

"McWorld is a product of popular culture driven by expansionist commerce. Its template is American, its form style. Its goods are as much images as matériel, an aesthetic as well as a product line. It is about culture as commodity, apparel as ideology. Its symbols are Harley-Davidson motorcycles and Cadillac motorcars hoisted from the roadways, where they once represented a mode of transportation, to the marquees of globe market cafes like Harley-Davidson's and the Hard Rock where they become icons of lifestyle. You don't drive them, you feel their vibes and rock to the images they conjure up from old movies and new celebrities, whose personal appearances are the key to the wildly popular international cafe chain Planet Hollywood. Music, video, theater, books, and theme parks – the new churches of a commercial civilization in which malls are the public square and suburbs the neighborless neighborhoods – are all constructed as image exports crating a common world taste around common logos, advertising slogans, stars, songs, brand names, jingles, and trademarks.... (Benjamin R. Barber, *Jihad vs. McWorld*, Times Books, Random House: New York, 1995, pp. 3, 4, 5, 6, 7, 8, 13-14, 16-17.)

Corporations Have Replaced the Nation-State in World Affairs

"Gillette's chairman Alfred M. Zeien has said 'I do not find foreign countries foreign.' Welcome to McWorld. There is no activity more intrinsically globalizing than trade, no ideology less interested in nations than capitalism, no challenge to frontiers more audacious than the market. By many measures, corporations are today more central players in global affairs than nations. We call them multinational but they are more accurately understood as transnational or

postnational or even antinational. For they abjure the very idea of nations or any other parochialism that limits them in time or space. Their customers are not citizens of a particular nation or members of a parochial clan: they belong to the universal tribe of consumers defined by needs and wants that are ubiquitous, if not by nature than by the cunning of advertising. A consumer is a consumer is a consumer.

"McDonald's serves 20 million customers around the world every day, drawing more customers daily than there are people in Greece, Ireland, and Switzerland together. General Motors (still the world's largest company despite its uneven recent sales history) employs more people internationally than live in a number of the world's smaller nations. With \$2.4 billion worth of pizzas sold in 1991, the privately owned Domino's earned enough revenues to fund the collective government expenditures of Senegal, Uganda, Bolivia, and Iceland. Toshiba, the General Electric of Japan, boasts in its 1992 annual report that 'as good corporate citizens' they 'do our part to ensure that progress continues within the world community,' but its citizenship – whether Japanese or global – is hemmed in on every side by limits set by the demands of profitability, which in turn is driven by sales in 1992 of \$25 billion, only slightly less than Argentina's recent government budget. Globalism is mandated by profit not citizenship. Fast food goes upscale in the chic new chain Planet Hollywood. And 'On Planet Reebok,' according to the successful ad campaign of an only nominally 'American' athletic shoe company, 'there are no boundaries.' Ralph Lauren's perfume for men, Safari, also boasted of 'Living Without Boundaries' in its launch campaign in 1992....

"...Ramonet argues that in the global economy neither capital nor work nor material is the determining factor, but rather the 'optimal relationship between these three,' which pushes us into the world of information, communication, and administration where traditional nation-states can exert little control and are bound to feel more and more uncomfortable. Robert Kuttner reports that the state-of-the-art handle for the postindustrial company – which clearly is also the post-nation-state company – is 'the virtual corporation' where 'the company is no longer a physical entity with a stable mission or location, but a shifting set of temporary relationships connected by computer network, phone and fax.'

"McWorld is a kind of virtual reality, created by invisible but omnipotent high-tech information networks and fluid transnational economic markets, so the *virtual corporation* is not just a provocative turn of phrase....

"Modern transnational corporations in quest of global markets cannot really comprehend 'foreign policy' because the word *foreign* has no meaning to the ambitious global businessperson. Like Gillette Chairman Zeien, they do not find foreign countries foreign: as far as production and consumption are concerned, there is only one world and it is McWorld. How can the physical distinction between domestic and foreign have resonance in a virtual world defined by

electronic communications and intrinsically unbounded markets? World trade in 1950 stood at \$308 billion. By 1968 it was over a trillion and today it has passed \$3 1/2 trillion; meanwhile, tariffs – as potent a symbol of national boundaries as there is – have declined from 40 percent of average product prices to about 5 percent. If world trade is comprising an ever greater percentage of world GDP, currency exchanges are in turn outstripping trade – some say by as much as three to one.... (Benjamin R. Barber, *Jihad vs. McWorld*, pp. 23-24, 26, 29-30.)

Global Interdependence Reinforces Fragmentation of the World

"With respect to McWorld, the clearest conclusion that can be drawn from this review is that the integrating forces of interdependence associated with globalism actually reinforce the fragmenting tendencies of Jihad they seem to combat. For mineral and energy use patterns seem both to enhance interdependence by reinforcing the imperative for global cooperation *and* to underscore divisiveness, injustice, and weakness, disclosing the susceptibility of the new world economy to the forces of Jihad.... (Benjamin R. Barber, *Jihad vs. McWorld*, p. 43.)

A Small Handful of Powerful Corporations Control the World Economy

"The infotainment telesector is the heart of McWorld and increasingly had the look of a wholly owned subsidiary of a small handful of powerful corporations that, by the month, grow fewer in number and more encompassing in ambition. The concept that drives the new media merger frenzy carries the fashionable name 'synergy,' which describes what is supposed to be the cultural creativity and economic productivity that arise out of conglomerating the disparate industries that once, quite separately, controlled all three segments of the infotainment telesector: the software programming, the conduits and pipes that distribute it, and the hardware on which it is displayed. The production companies turning out product, the phone and cable and satellite companies, and the companies manufacturing or controlling television sets and computers and multiplexes all, in McWorld's ideal economy, belong in the hands of one global company. *Synergy* turns out to be a polite way of saying monopoly. And in the domain of information, *monopoly* is a polite word for uniformity, which is a polite word for virtual censorship – censorship not as a consequence of political choices but as a consequence of inelastic markets, imperfect competition, and economies of scale – the quest for a single product that can be owned by a single proprietor and sold to every living soul on the planet.

"Traditional corporate ambitions that aimed at monopoly within a particular medium have been displaced by the drive for monopoly across media. By the 1990s, according to Bagdikian, seventeen intermedia conglomerates were earning half the total revenues 'from all media' including recordings, cable, and videocassettes. Conglomeration had reduced the number of players from forty-six in 1981 to twenty-three in 1991, of which a handful are genuinely intermedia.

Moreover, Bagdikian was describing the situation just before the Japanese buy-in and the very recent erosion of boundaries between telephone, cable, and broadcast transmission that has accelerated the conglomeration process even more radically.

"Corporations are aiming at control over each step of the image-making process from source to consumer. Where once an author wrote a book and (perhaps via an agent) sold it to a publisher who then printed it, sold serial rights to an independent magazine, and then found still other independent distributors and booksellers to sell it; and where once the author or agent or publisher marketed it to Hollywood, where an independent film studio bought it and turned it into a film, and then found an autonomous distributor to release it and an independent movie-house owner or chain to show it; and where once the film studio sold rights to an independent broadcaster to show the film on television – so that when the full commercial cycle was completed perhaps a few dozen different independent entities participated in a complex, competitive process to bring a creative work to an extended multimedia public by means that allowed both entry and exit for many different creative and financial forces, and maximized choice and opportunity for cultural creators and cultural consumers alike – today the wonders of synergy permit one entity to control the entire process. Not only is the corporate proprietor of a conglomerate likely to own a stable of publishers, one of which will publish a given book, but it can also own the agency that sells the book, the magazine the serializes it, the movie studio that buys and films it, the distributor that purveys it, the cinema chain that screens it, the video export firm that brings it to the global market, and perhaps even the satellite pods or wires through which it is broadcast and the television set and VCR on which it is finally screened somewhere in, say, Indonesia or Nigeria. This is not synergy: this is commercial totalitarianism – a single value (profit) and a single owner (the monopoly holder) submerging all distinctions and rendering all choice tenuous and all diversity sham....

"This takeover mania began in the early 1980s, with quite literally hundreds of media mergers and buyouts, of which I have listed only a representative sample on the accompanying table of media mergers...." (Benjamin R. Barber, *Jihad vs. McWorld*, pp. 137-139, 140.)

Media Mergers Throughout the World

Date/Target/Buyer	Price (in billions)
1966 Paramount (first round) – Gulf & Western (changed name to Paramount in 1989)	\$.125
1982 Columbia – Coca-Cola	\$.750
1985 Fox Broadcasting – Murdoch's News Corp.	

- (20th Century Fox, Fox Television, Fox Broadcasting Co. \$.575
- 1985 MGM/United Artists – Turner Broadcasting
 (keeps MGM's 3,000 film library but sells off the rest for \$.800) \$1.500
- 1986 NBC Network (RCA) – General Electric \$6.500
- 1988 CBS Records – Sony
 (as prelude to bid for Columbia) \$2.000
- 1989 Columbia Pictures – Sony
 (price – in cash – does not include \$1.3 debt assumption and buyout of
 Coke's 49 percent holding) \$3.800
- 1989 Warner Communications (Warner Bros. Pictures) – Time Inc. creates Time
 Warner
 (Paramount tried to interdict this deal via hostile offer by Time,
 Inc.!) \$14.000
- 1990 MCA (first round) – Matsushita (Panasonic: Japanese electronics giant)
 (Universal Pictures and Music), including MCA Records,
 Geffen Records, Motown; publishers group including Putnam,
 Berkley, Jove, Grosset & Dunlap, coward-McCann; theme parks
 including Universal City Studios, Hollywood, Florida \$6.100
- 1992 Videoland (video rental chain) – Philips
 (Dutch electronics giant, chip maker) \$.148
- 1992 MGM (film studio) – Credit Lyonnais
 (French bank takes over from bankrupt Italian buyer; must resell within 5
 years) \$1.300
- 1993 Time Warner – U.S. West (a Baby Bell) buys 1/4 share \$2.500
- 1993 McCaw Cellular Communications – AT&T \$12.600
- 1993 Hauser Communications (cable company) – Southwestern Bell \$.650

1993 Grupo Iusacell (Mexico's second largest cellular company) – Bell Atlantic \$1.040

1993 MCI (long distance company) – British Telecom (buys 1/5 stake) \$4.300

1993 Sprint – France Telecom \$2.100

Deutsche Telekom \$2.100

1993 Wometco & Georgia – U.S. West \$1.200

1993 Castle Rock Films and New Line Cinema – Turner Broadcasting \$.672

1993 Republic Pictures (distribution company) – Blockbuster Video
(video chain and supporter of Viacom bid for Paramount) \$.100

1993 Liberty Media – Tele-Communications, Inc.
as prelude to Bell-Atlantic merger, repurchases Liberty after earlier spin-off \$8.300

1993 T.C.I. (Tele-Communications, Inc., the largest cable company
in the world with 25 percent of U.S.) – Bell Atlantic \$26.000

1994 Nextel – Motorola \$1.760

1994 Times Mirror Cable – Cox Cable \$2.300

1994 Paramount (second round) – Viacom
Redstone's cable empire, after a long bidding war with Barry Diller's
Home Shopping Network (QVC) \$10.000

1994 Blockbuster – Viacom, adding to its Paramount property \$7.600

1995 Houston Industries – Time Warner \$2.300

1995 Cablevision Industries – Time Warner \$2.200

(Benjamin R. Barber, *Jihad vs. McWorld*, pp. 141-143.)

The Integrating Forces of McWorld Have Dismantled Democracies Throughout the World

"And so the original question reappears: in a world where the nation-state and its democratic institutions are being fractured and weakened by the divisive forces of Jihad at the same moment they are being rendered antiquated and superfluous by the integrating forces of McWorld, how is democracy to survive? Where on the vaunted information highway are the roads that will lead to justice or the pipes that will convey the vox populi? Now that they have dismantled the empire of despots and statist political ideologies, including democracy, how can communities defend their common goods in common and thereby free ourselves from the inadvertent public consequences of all the private market choices that masquerade as the whole of freedom? Is deliberative public debate on such questions even possible where McWorld's communication systems secret preferences that, without any discussion at all, modify public attitudes and precipitate private behaviors?...

"The very idea of the public has become so closely associated with nation-states that the idea of a global public potent enough to take on McWorld's global privates seems inconceivable, especially given the further fracturing of local public entities by Jihad's many neotribalisms. In the solipsistic virtual reality of cyberspace, commonality itself seems to be in jeopardy. How can there be common ground when the ground itself vanishes and women and men inhabit abstractions...." (Benjamin R. Barber, *Jihad vs. McWorld*, pp. 137-139, 140, 141-143, 150-151.)

The Emergence of Global Tyranny and Greed

"...The market's invisible hand is attached to a manipulative arm that, unguided by sovereign head, is left to the contingencies of spontaneous greed. Tyranny here is indirect, often even friendly. Alexis de Tocqueville first captured its character 160 years ago when he wrote: 'Fetters and headsmen were the coarse instruments that tyranny formerly employed; but the civilization of our age has perfected despotism itself.... Monarchs had...materialized oppression; the democratic republics of the present day have rendered it as entirely an affair of the mind.... [T]he body is left free, and the soul is enslaved.' The ideology of choice seems to liberate the body (you can choose sixteen brands of toothpaste, eleven models of pickup truck, seven brands of running shoes) but fatally constricts the possibility of real freedom for the soul (you cannot choose *not* to choose, that is, you cannot choose to withdraw from the market or reject the demands of the body.)

"McWorld's markets surrender judgment and abjure common will, leaving public goods to private interests and subordinating communities and their goods to individuals and their interests. The apparent widening of individual consumer choices actually shrinks the field of social choices and forces infrastructural changes no public community ever consciously either selects or rejects. For example, the American's freedom to choose among scores of automobile brands

was secured by sacrificing the liberty to choose between private and public transportation, and mandated a world in which strip malls, suburbs, high gas consumption, and traffic jams (to name just a few) became inevitable and omnipresent without ever having been the willed choice of some democratic decision-making body – or for that matter of individuals who liked driving automobiles and chose to buy one. This politics of commodity offers a superficial expansion of options within a determined frame in return for surrendering the right to determine the frame. It offers the feel of freedom while diminishing the range of options and the power to affect the larger world. Is this really liberty?

"Internationally, much the same thing is occurring. McWorld speaks the language of choice but severs the 'freedom' to buy and sell from the right of women and men to choose in common their common goods or the social character of their shared world. The IMF and the World Bank promote markets but are interested only prudentially if at all in promoting democracy. Indeed, they have shown themselves willing to sacrifice civic equilibrium and social equality for purely economic goals like privatization and free trade. They impose on fragile new would-be democracies economic crash plans that, while they suit the investment strategies of their member nations (and, more important, their member banks), also guarantee popular resentment and generate a nostalgia for the old Communist safety nets. Neo-tribalism and Jihad are often the final beneficiaries. In the near run, agreements like GATT may seem to have a regulative impact since they place power in collectivities of nations – the new World Trade Organization created by GATT, for example – and impose an internationalist majoritarianism on individual nations. Although this compromises the capacity of individual states to regulate their own economies, it supposedly does so in the name of global distributive justice and transnational public goods. In the long run, however, as national sovereignty weakens, the new arrangements actually cede power to markets susceptible to no democratic supervision whatsoever and shrink the global possibilities for public choosing on behalf of fundamental social values.

"Jack Heinkman, president of the Amalgamated Clothing and Textile Workers Union, has complained that the GATT agreement legitimizes the exploitation of up to 200 million children, while the insidious environmental consequences of the surrender of sovereignty have been widely denounced in Europe and in America. Further down the road, however, it is not increasingly less sovereign nations quarreling among themselves but multinational firms and their global markets that will dictate to America and other countries what is and is not possible: whether or not five-year-olds will work thirteen-hour shifts in Pakistan for 20 cents a day, whether or not scrubless on-the-cheap smokestacks in one Asian country will be allowed to undo the good work of conscientiously (and expensively) built facilities in another. Even responsible American firms like Levi Strauss and Company, which has developed voluntary 'Global Scouring Guidelines' for its overseas facilities, are driven by competition and profits to seek cheap labor markets, where

exploitation is endemic and regulation mainly a public relations afterthought...." (Benjamin R. Barber, *Jihad vs. McWorld*, pp. 220-222.)

The Elimination of National Sovereignty

"...Sovereignty is the provenance of citizenship. The sovereignty of democratic states, which gives politics a regulative function with respect to all other domains, is nothing other than the sovereignty of citizens who, in their civic capacity, make advertent common decisions that regulate the inadvertent consequences of their conduct as private individuals and consumers. In a future world where the only available identity is that of blood brother or solitary consumer, and where these two paltry dispositions engage in a battle for the human soul, democracy does not seem well placed to share in the victory, to whomsoever it is delivered. Neither the politics of commodity nor the politics of resentment promise real liberty; the mixture of the two that emerges from the dialectical interplay of Jihad versus McWorld – all it the commodification of resentment – promises only a new if subtle slavery...."

"Thomas Jefferson's warning that merchants have no country has become a literal truth for the multinational corporations of McWorld...." (Benjamin R. Barber, *Jihad vs. McWorld*, pp. 224, 231.)

Integrating the Economies of the World

"Economic interdependence among nations has increased sharply in the past half century. For example, while the value of total production of industrial countries increased at a rate of about 9 percent a year on average between 1964 and 1992, the value of exports of those nations grew at an average rate of 12 percent, and lending and borrowing across national border through banks surged upward even more rapidly at 23 percent a year. This international economic interdependence has contributed to significantly improved standards of living for most countries. Continuing international economic integration holds out the promise of further benefits. Yet the increasing sensibility of national economies to events and policies originating abroad creates dilemmas and pitfalls if national policies and international cooperation are poorly managed...."

"Two underlying sets of causes have led nations to become more closely intertwined. First, technological, social, and cultural changes have sharply reduced the effective economic distances among nations. Second, many of the government policies that traditionally inhibited cross-border transactions have been relaxed or dismantled.

"The same improvements in transportation and communications technology that make it much easier and cheaper for companies in New York to ship goods to California, for residents of Strasborg to visit relatives in Marseilles, and for investors in Hokkaido to buy and sell shares on the Tokyo Stock Exchange

facilitate trade, migration, and capital movements spanning nations and continents. The sharply reduced costs of moving goods, money, people, and information underlie the profound economic truth that technology has made the world markedly smaller.

"New communications technology has been especially significant for financial activity. Computers, switching devices, and telecommunications satellites have slashed the cost of transmitting information internationally, of confirming transactions, and of paying for transactions. In the 1950s, for example, foreign exchange could be bought and sold only during conventional business hours in the initiating party's time zone. Such transactions can now be carried out instantaneously twenty-four hours a day. Large banks pass the management of their world-wide foreign-exchange positions around the globe from one branch to another, staying continuously ahead of the setting sun.

"Such technological innovations have increased the knowledge of potentially profitable international exchanges and of economic opportunities abroad. Those developments, in turn, have changed consumers' and producers' tastes. Foreign goods, foreign vacations, foreign financial investments – virtually anything from other nations – have lost some of their exotic character.

"Although technological change permits increased contact among nations, it would not have produced such dramatic effects if it has been countermanded by government policies. Governments have traditionally taxed goods moving in international trade, directly restricted imports and subsidized exports, and tried to limit international capital movements. Those policies erected 'separation fences' at the borders of nations. From the perspective of private sector agents, separation fences imposed extra costs on cross-border transactions. They reduced trade and, in some cases, eliminated it. During the 1930s governments used such policies with particular zeal, a practice now believed to have deepened and lengthened the Great Depression.

"After World War II, most national governments began – sometimes unilaterally, more often collaboratively – to lower their separation fences, to make them more permeable, or sometimes even to tear down parts of them. The multilateral negotiations under the auspices of the General Agreement on Trade and Tariffs (GATT) – for example, the Kennedy Round in the 1960s, the Tokyo Round in the 1970s, and most recently the protracted negotiations of the Uruguay Round, formally signed only in April 1994 – stand out as the most prominent examples of fence lowering for trade in goods. Though contentious and marked by many compromises, the GATT negotiations are responsible for sharp reductions in at-the-border restrictions on trade in goods and services. After the mid-1980s a large number of developing countries moved unilaterally to reduce border barriers and to pursue outwardly oriented policies.

"The lowering of fences for financial transactions began later and was less dramatic. Nonetheless, by the 1990s government restrictions on capital flows, especially among the industrial countries, were much less important and widespread than at the end of World War II and in the 1950s.

"By shrinking the economic distances among nations, changes in technology would have progressively integrated the world economy even in the absence of reductions in governments' separation fences. Reductions in separation fences would have enhanced interdependence even without the technological innovations. Together, these two sets of evolutionary changes have reinforced each other and strikingly transformed the world economy.

"Simultaneously with the transformation of the global economy, major changes have occurred in the world's political structure. First, the number of governmental decisionmaking units in the world has expanded markedly, and political power has been diffused more broadly among them. Rising nationalism and, in some areas, heightened ethnic tensions have accompanied that increasing political pluralism.

"The history of membership in international organizations documents the sharp growth in the number of independent states. For example, only 44 nations participated in the Bretton Woods conference of July 1944, which gave birth to the International Monetary Fund. But by the end of 1970, the IMF had 118 member nations. The number of members grew to 150 by the mid-1980s and to 178 by December 1993. Much of this growth reflects the collapse of colonial empires. Although many nations today are small and carry little individual weight in the global economy, their combined influence is considerable, and their interests cannot be ignored as easily as they were in the past.

"A second political trend, less visible but equally important, has been the gradual loss of the political and economic hegemony of the United States. Immediately after World War II, the United States by itself accounted for more than one-third of world production. By the early 1990s the U.S. share had fallen to about one-fifth. Concurrently, the political and economic influence of the European colonial powers continued to wane, and the economic significance of nations outside Europe and North America, such as Japan, Korea, Indonesia, China, Brazil, and Mexico, increased. A World in which economic power and influence are widely diffused has displaced a world in which one or a few nations effectively dominated international decisionmaking.

"Turmoil and the prospect of fundamental change in the formerly centrally planned economies compose a third factor causing radical changes in world politics. During the era of central planning, governments in those nations tried to limit external influences on their economies. Now leaders in the formerly planned economies are trying to adopt reforms modeled on Western capitalist principles. To the extent that these efforts succeed, those nations will increase their economic

involvement with the rest of the world. Political and economic alignments among the Western industrialized nations will be forced to adapt.

"Governments and scholars have begun to assess these three trends, but their far-reaching ramifications will not be clear for decades.

"Cross-border economic integration and national political sovereignty have increasingly come into conflict, leading to a growing mismatch between the economic and political structures of the world. The effective domains of economic markets have come to coincide less and less with national governmental jurisdictions.

"When the separation fences at nations' borders were high, governments and citizens could sharply distinguish "international" from "domestic" policies. International policies dealt with at-the-border barriers, such as tariffs and quotas, or responded to events occurring abroad. In contrast, domestic policies were concerned with everything behind the nation's borders, such as competition and antitrust rules, corporate governance, product standards, worker safety, regulation and supervision of financial institutions, environmental protection, tax codes, and the government's budget. Domestic policies were regarded as matters about which nations were sovereign, to be determined by the preferences of the nation's citizens and its political institutions, without regard for effects on other nations.

"As separation fences have been lowered and technological innovations have shrunk economic distances, a multitude of formerly neglected differences among nations' domestic policies have become exposed to international scrutiny. National governments and international negotiations must thus increasingly deal with "deeper" – behind-the-border – integration. For example, if country A permits companies to emit air and water pollutants whereas country B does not, companies that use pollution-generating methods of production will find it cheaper to produce in country A. Companies in country B that compete internationally with companies in country A are likely to complain that foreign competitors enjoy unfair advantages and to press for international pollution standards.

"Deeper integration requires analysis of the economic and the political aspects of virtually all nonborder policies and practices. Such issues have already figured prominently in negotiations over the evolution of the European Community, over the Uruguay Round of GATT negotiations, over the North American Free Trade Agreement (NAFTA), and over the bilateral economic relationships between Japan and the United States. Future debates about behind-the-border policies will occur with increasing frequency and prove at least as complex and contentious as the past negotiations regarding at-the-border restrictions.

"Tensions about deeper integration arise from three broad sources: cross-border spillovers, diminished national autonomy, and challenges to political sovereignty." (Henry J. Arron, Ralph C. Bryant, Susan M. Collins and Robert Z. Lawrence.

Quoted in the Preface to the Studies on Integrating National Economies in Miles Kabler, *International Institutions and the Political Economy of Integration*, Washington, D. C.: The Brookings Institution, 1995, pp. xi, xii-xvi.)

A Road Map for the 21st Century

"It is the thesis of this book that most of the griping social problems we are bombarded with each day in our newspapers, jobs, families, and communities are all diverse manifestations of a single common factor: a shift into an "Age of Everything-Everywhere." The way we live, work and govern ourselves is about to plunge into a fundamental shift, a major break from old trends. We are on the threshold of one of those rare moments in history – that have only happened three times before – when all the cards of power and wealth, of family and self, are being reshuffled and dealt anew...."

"To understand the scope of the coming transition, we can study the previous shifts into new dimensions. Each leap into a new dimension was accompanied by a complete shakeup in political organization. A major shift occurred during the First Dimension from the countless bands of nomadic cave dwellers toward highly organized collective governments in the growing villages and nascent city-states. The Second Dimension saw the rise of regional kingdoms followed by colonial empires spanning the globe. The Third Dimension gave rise to a superpower rivalry and a struggle to control the heavens. We will soon see why the Fourth Dimension, for good or bad, will herald global government.

"The rules governing wealth will also shift.

"Accumulating wealth is much like accumulating political or military power. Any new competitive edge, additional piece of information, or ability to maneuver can spell the difference between success and failure. Each new dimension gives birth to an additional degree of freedom and action, as well as the ability to reach fresh opportunities inaccessible to those who do not enter the realm of the new dimension. The new wealthy citizens of the First dimension were the merchants and traders who capitalized on the new dimension – the vital trade route.

"Similarly, when society progressed to the Second Dimension, those who accumulated unparalleled wealth were those who knew how to set up empires and control the seas (as did the Phoenicians and Greeks, later the Romans and Venetians, then the Spanish and the English).

"The Third Dimension, the era of air transport, gave great new power to multinational corporations to move personnel, parts, and finished goods overnight. It made for easier competition against those who did not make this transition. Manufacturing could be established around the world to take advantage of differences in wages, materials, and skills. It allowed the creation of truly global organs of wealth that often outgrew the host nations in which they operated...."

"As global capital grows, global banks – the pipelines through which capital flows – wield enormous power. Many have become so large as to outstrip the national treasuries of many countries. Each of the top five global banks alone has more assets than the government reserves (including gold) of the United States, Japan, and Germany combined. These financial giants are redefining banking and greatly facilitating our shift into a global free-flow of capital.

"With 2,200 overseas offices in eighty-nine countries, Citicorp is the most far-flung bank in the world. With 20 million customer accounts, it also has the greatest number of clients, scattered throughout Europe, Asia, North America, and the expanding economies of the Second World.

"Only a decade ago, its customers in Hong Kong or Australia could only get local services; going from one branch office to another was almost like changing banks. Then Citi spent a billion dollars on state-of-the-art computer and telecommunications equipment and melded thousands of branch offices in scores of countries into a single bank. Citicorp had gone global.

"Today any terminal in the bank can scour a hundred countries for the best interest and exchange rates and the best combination of currencies, taking local tax codes into account. Corporations can collect bills from customers abroad because the receivable can be sold to Citi, which has the global clout and local muscle to make buyers pay up. Ten years earlier, the technology to operate on such a scale simply did not exist.

"Citi's new global services are for corporations and individual clients as well. Its best customers receive multicurrency accounts enabling them to write or cash checks in any currency. Its 2 million credit cards are valid all over the world, no matter where the holder lives or how he or she is billed. Citi's 2,000 ATM machines worldwide are tied into a single network, allowing a tourist in Buenos Aires to tap into account balances in New York or Paris. Home banking terminals have leveraged Citi's services even further: they bring the services of a megabank into every home or office equipped with a phone line.

"Competitive pressure are forcing banks to follow Citi's lead and integrate branch offices into a single whole. Banks are also exchanging data with one another through credit card or ATM transactions, check clearinghouses, and wire transfers. They will soon share the same global regulations. In the end, while the logos on the bank doors will vary, they will all have effectively merged into a single organism....

"The same sources are also transforming the world's stock exchanges and financial centers. Until recently, the various national stock exchanges had evolved surprisingly little since the first gathering of Dutch merchants in front of the Van der Buerse home in the thirteenth century. Five centuries later, two dozen stockbrokers met under a buttonwood tree in lower Wall Street in much the same

fashion. Over time, the meeting place became the world's largest marketplace for securities, the New York Stock Exchange (NYSE).

"Today, the tree is gone but the trade is conducted in ways similar to the Van der Buerse's, with buyers and sellers running, crowding together, raising hands, frantically yelling to get their order entered in the books. These procedures are followed in Paris, Brussels, Copenhagen, Stockholm, Zurich, Tokyo, and elsewhere.

"Over the next twenty years, a radical transformation will occur in how sellers find buyers in the Placeless Society. As centers are no longer needed, stock markets as we have known them will become extinct. The reasons, of course, are computers, telecommunications, overnight couriers – and the sun. In a global economy, the sun never sets. As investors hold an increasing proportion of their portfolio in foreign companies, they are no longer willing to wait until foreign stock exchanges open in order to buy or sell. Because of different time zones, a seller in Bonn would have to wait until mid-afternoon before the NYSE even opened for business.

"The future belongs to Fourth Dimension clearinghouses like the NASDAQ, which, unlike a physical stock exchange in one location, are networks of brokerages connected electronically. Their operations are simultaneously accessible by anyone in the world. Although the NASDAQ is much younger than the NYSE, it already enjoys the same share volume.

"Yet other avenues of trading are already developing. Nadoff, Instinet, Posit, Transvik, and other systems execute trades on an automated basis. And the big brokerage firms like Merrill Lynch match buyers with sellers in-house, linking up to other networks as needed. These automated systems will necessarily become interlinked and competitive, bringing transaction costs to near zero. Thus the world's stock markets will have merged into a twenty-four-hour auction with automated middlemen. Liquidity, geographic scope, and transaction volumes will never have been greater.

"The automation of global capital flows will make financial "centers" obsolete. Almost everyone in the global web has access to the same information and can effect the same transactions. Hence the concentrated power of London, New York, and Tokyo may be reduced to mere processing nodes in a ubiquitous network.

"London, the world's premier financial center, has more international banks and orchestrates more international financial transactions than any other city. Yet the decentralization caused by digital capital is rapidly eroding its preeminence; power is diffusing to offices and computer terminals everywhere. The world no longer needs a financial "center."

"Nor does the world need banks as we have known them. Banks once supplied the crucial missing link between providers of capital (depositors) and borrowers. In the Age of Everything-Everywhere, a borrower no longer needs the bank to find the cash. With computerization, large corporations go directly to cash-rich insurance companies and pension funds when they need to borrow cash, eliminating the need for middlemen. Large institutional investors set up computerized networks, look for ways to swap shares among themselves, and bypass the stockbrokers altogether."...

"But far more has changed than the nature of capital or the institutions that manage it. At stake is the very role of the nation-state. This is an era in which capital has become so fluid and omnipresent that it can no longer be controlled by individual countries. When capital represented physical things (tractors or inventory), it could be stopped at the border. But when capital is conveyed in electrical impulses, borders become meaningless. For a capitalist in the Age of Everything-Everywhere, nation-states no longer exist.

"John Maynard Keynes argued in 1936 that a government could fine-tune its economy by modulating its levels of taxing and spending. Later the monetarists further argued that governments could control their economies by regulating the interest rate and money supply. For the last thirty years, Keynesianism and monetarism were the two levers used by industrialized economies to control their expansion.

"Fiscal and monetary policies worked somewhat in the 1960s and 1970s when national economies were still closed systems. In the Placeless Society, they no longer work, and both Keynesianism and monetarism are obsolete. The enemy, of course, is digital capital....

"Many investors in the United States have discovered a simple way to invest internationally, in everything – from Mitsubishi and Deutsche Bank to Telefonos de Mexico – through any of 1,400 world-class companies traded on US exchanges as American Depositary Receipts (ADRs). The ADR certificates represent ownership of a pool of shares of foreign-based corporations that are held in bank vaults. The bank, in turn, takes care of dividend distributions, foreign-currency conversions, foreign taxes, and paperwork. The trading of ADRs has now topped \$200 billion a year; with fifteen new companies listed each month, the volume has been doubling every two years for the past decade.

"Global investors may also buy into a mutual fund that offers a cocktail of several stocks lumped together. Operated for a small fee by professional fund managers, mutual funds absorb the still-present idiosyncrasies of global investing. They benefit from the extraordinary investment opportunity available in areas of rapid growth, and, like ADRs, translate remote-country investment opportunities into all the advantages of digital capital transacted in a flash.

"International mutual funds come in several flavors to suit the investor's tastes: there are country funds like the "German fund" or the "Chilean fund"; regional funds, which group related countries together, as in the "European fund," the "Asian fund," or the "Latin America" fund; and "global funds," which target the best of the planet....

"World trade accounts for nearly \$8 trillion in goods and services a year, a number that is still growing fast. In the United States, the proportion of the economy involved in trade has doubled in the past two decades and represents one-sixth of total GNP. A quarter of US agricultural product is sold abroad, and one in six American manufacturing jobs depends on exports.

"While the United States is dependent on foreign trade, it pales by comparison with the rest of the world. The average country is twice as dependent on world trade as is the United States. One-half of the value of the economies of Germany, France, the United Kingdom, and Canada consist of imports and exports. In nineteen countries the level of annual trade is so great that the value of products clearing its ports exceeds its GNP; Singapore, truly a "distributor nation," ships products in and out at such a frenetic pace that they equal nearly five times its national income. Without international trade, national economies simply stop.

"This reality of placeless commerce, our mutual dependence on one another, is the primary force tearing down centuries-old administrative barriers between our countries. The average worldwide tariff has fallen from nearly half the value of an imported product in the early 1950s to less than 5 percent today. Passenger cars, foods, and pharmaceuticals are standardized to enable them to cross borders without administrative hurdles. More and more, commerce is conducted in a borderless world.

"While protectionist politicians flex their muscles from time to time, our world economy has grown so interdependent that it would be impossible to reerect barriers between countries without causing their economies to crash. Nations are no longer insular economic blocks acting on their own, but integral threads in a vast fabric. The world's economy can no more return to isolated nation-states than Europe or Japan can return to medieval feudalism. The forces of placelessness integrating the world economy are just too strong to let us slide backward....

"As world trade has grown, so have its captains: the multinational corporations. They cross national boundaries so freely that the major cities of the world have the same business directory, products, and services: Agfa-Gevaert, Amoco, Barclays Bank, Bayer, Canon, CIBA-Geigy, Citicorp, Citizen Watch, Club Med, Coca-Cola, Conoco, Du Pont, Esso, Exxon, Ford, Fuji, General Electric, General Motors, Gulf, Hewlett-Packard, Hoechst, Honda, Hyundai, IBM, Kodak, Levi Strauss, Matsushita, Maxwell, Mazda, Mitsubishi, Mobil Oil, Monsanto, Nestle, Nippon, Nissan, Procter & Gamble, Ricoh, Sanyo, Seagram, Sharp, Shell, Siemens,

SmithKline, Sony, Sumitomo, TDK, Texaco, Texas Instruments, 3M, Toshiba, Toyota, Unilever, Xerox, Yamaha – even McDonald's.

"These and 37,000 other titans expand unimpeded in a global market and now rival nation-states on the rosters of world power. One-third of global trade is conducted between diverse branches within the same corporation. The companies account for over one-fourth of global production and often dwarf the economic power of the countries in which they operate. Even in 1990, of the top 125 economic entities (whether government or corporate), over half were multinationals. In 1992 the revenues of General Motors would make it the largest "country" in Africa and the second largest in South America. The entire GNP of oil-rich Saudi Arabia is only slightly larger than the revenues of Exxon. All Venezuela fits easily into IBM. Toyota and Daimler-Benz each produce more than the Philippines. Holland's Philips, Switzerland's Asea Brown Boveri, and Sweden's Electrolux all practically dwarf the countries that contain them.

"Rather than be intimidated by these commercial giants, each country now seems to court them to gain their favors, dismantling bans against foreign-owned transnational corporations. Canada, India, Russia, Mexico – even Cuba and China – are opening their markets and liberalizing ownership rules. And the multinational corporations come.

"The nature of multinational corporations is also changing. Not only do they have distinct operations in two or more countries, but they also are managed as if countries did not exist: there is only the world.

"The term multinational is out of date because it implies that nationality is relevant. It is like calling ozone depletion, AIDS, or weather patterns multinational instead of global. Many economists now use the term transnational, but that misses the point too: the idea of national classification is steeped in nineteenth-century notions of economics and power. The titanic entities that live among us do not see "nations."

"They take the best from around the world, ignoring lines on political maps. When necessary, they blend chameleonlike into the local landscape, owing no allegiance. Like a headless amoeba, the corporate headquarters could as easily be in one country as another, or not be confined to place at all. This new engine of global wealth is perhaps best described as a globocorp....

"As the poorer two-thirds of the world's 5 billion people rise from the mud, the globocorps are eager to provide them with soaps, machines, cameras, and radios, a form of industrial "Coca-colonization." With much of Asia, Latin America, Africa, and Eastern Europe just beginning to build their economies, the globocorps – many say "globalopolies" are ready....

"The shift toward globalization will create new challenges and opportunities. Globocorps are already so numerous and powerful that some firms specialize in selling services to other globocorps. Ogilvy & Mather's strategy is to develop one-stop shopping for its globocorps. Ogilvy & Mather's strategy is to develop one-stop shopping for its globocorp clients doing worldwide advertising. It was the first Western company to set up advertising behind the Iron Curtain, and it maintains nearly 300 offices around the world.

"The very company that provides communications to globocorps is itself global. Intelsat (International Telecommunications Satellite Organization) is a consortium of 122 countries. The system comprises a cosmic highway with seventeen satellites transporting telephone, facsimile, telex, computer data, and television signals, at the speed of light. Intelsat enables Citibank to monitor its global capital flows, IBM to talk to its suppliers in Japan, and Hewlett-Packard to implement state-of-the-art products on a global scale....

"As the Baton of economic power passes to the rising globocorps, global managers are waltzing through world cultures with grace. This new breed of multicultural player glues together projects whose teams span the globe. The recent head of General Electric's computing tomography group illustrates this trend: born in Morocco of Jewish parents and schooled in France, he received his PhD in California, married an American, worked in Paris, and headed up GE Medical Systems in Wisconsin.

"During the 1980s the board of directors of the world's major corporations shifted toward an international composition in preparation for the new realities. Britain's Imperial Chemical Industries illustrate the shift. In 1982 ICE's sixteen-person board was all British; by 1989 it included two Americans, a Canadian, a Japanese, and a German. Of the top 180 executives of ICI, over a third are now foreign. Whirlpool International, headquartered in Italy, has a six-person management team with executives from Sweden, Holland, Belgium, Germany, Italy, and the United States. The eight-person board of Switzerland's engineering giant Asea Brown Boveri is made up of four nationalities, and their executive committee is made up of five. IBM has five nationalities among its top executives, Unilever has four, and Shell Oil has three. Japan broke ground when Sony appointed an American and a German to its board. With competition like this, the large corporations that fail to diversify their top management are unlikely to flourish in the world we are entering.

"Globocorps are so supranational that they feel little loyalty toward the nation-state where they are headquartered, and global managers reflect this new reality: they are not to promote a particular country but to undertake activities that enhance the globocorp's profitability, market share, or stock price....

"Because our globocorps and their managers seek to act as though borders do not exist, it is impossible to classify a corporation by its national allegiances. Corporate nationality is a dated notion. At one time, Ford was clearly American, and Volkswagen German. Management, employees, shareholders, production facilities, even key suppliers, were all from the same country. Globocorps don't follow such simple rules.

"Today, it is hard to tell an American globocorp from a European or Japanese one. Their "nationality" is as meaningless as the "nationality" of the clouds blowing across the sky. Consider IBM, the jewel of "American" know-how: headquartered in Armonk, New York, with research facilities in Switzerland and operations in forty-six countries, it purchases components from Japan, assembles them in Singapore, markets and services everywhere. Almost two-thirds of IBM's revenues are outside the United States; its stock is traded in the major exchanges of ten countries; its list of shareholders include Saudi Arabians, Koreans, and Belgians; and it pays taxes everywhere.

"Even the national companies set up by European governments after World War II have turned their backs on economic nationalism. Britain's largest glassmaker, Pilkington, has joined forces with Nippon Sheet Glass in Japan and Saint-Gobain in France. Italy's Olivetti is working closely with Japan's Hitachi. Daimler-Benz, Germany's largest and most powerful industrial group, is courting Mitsubishi and Fujitsu and has acquired Britain's ICL. These global pioneers are charting new territory in a new world, disregarding the favors of parochial politicians....

"While governments compete with sweet deals to attract free-flowing globocorps, there is a risk: their goals are divergent. Governments strive to increase local standards of living and offer full employment, whereas globocorps strive to maximize worldwide market share, profits, and shareholder values. While international business is surging ahead in a supercharged "turbocapitalism," the political world is being left behind in the dust. In many ways, the economic system is becoming entirely decoupled from the political structures that once controlled and regulated them.

"The fluidity of globocorps gives them a power edge over rigid government structures. The more corporations globalize, the less authority and control is left to local or national governments. Corporations can play off one regional government against another and dictate the terms of their involvement. This is happening in tax concessions, infrastructure subsidies, and enforcement of pollution and worker-safety controls. Power is inexorably shifting from nations to newer economic engines.

"The history of multinational corporations over the past 200 years provides key insight into the globocorps of the next century. When multinational trading companies grew in prominence in the seventeenth and eighteenth centuries,

"primitive" peoples were impotent to negotiate with these technologically superior entities that came with guns, ideas, and jobs, making offers that could not be refused. Their ships left with slaves, gold, silver – anything the trading companies deemed of value that could be sold elsewhere.

"By the twentieth century, small industrialized nations began to feel the pressures of multinational corporations usurping their sovereignty. Finland, Costa Rica, and Malaysia, swimming in a sea of corporate giants, currently have little autonomy. As nations, they lacked a critical mass in language, technology, or economic muscle to compete successfully without surrendering sovereignty. For decades they had to give up any notion of autonomous development; their economies were largely at the pleasure of nimble globocorps looking for the best deals.

"What was first true for poorer regions, then small industrialized countries, is now also true for the giants: Germany, France, Japan, and the United States. Once, US multinationals "invaded" Latin America; now, the United States feels an invasion by the Japanese, and Europe feels the presence of the Americans. Today, even the superpowers are losing their freedom to set interest rates, pollution controls, tax rates, or social programs. Unseen forces of globalization seem in control, pitting one set of national programs against another, forcing them into a common battle to attract globocorp trade. The last vestiges of do-it-alone national sovereignty have nearly vanished....

"In America, politicians look the other way while accepting millions of dollars in political "contributions." The donors' list reads like a *Who's Who* of international business, including Switzerland's CIBA-Geigy and Nestle, Canada's Seagram, and Hong Kong's Marine Midland Banks.

"Globocorps routinely hire high-powered Washington lobbyists (often former government employees) to push the right buttons along Pennsylvania Avenue. In 1987 and 1988, when Toshiba faced US trade sanctions for selling sensitive materials to the Soviet Union, Toshiba reportedly spent \$30 million on lobbyists. In 1982, when Tennessee Senator James Sasser supported buy-American automobile legislation, Nissan executives held a fund-raiser supporting Sasser's opponent. If sovereignty means controlling one's political system, countries everywhere are losing their sovereignty. Governments and democracies will survive, but unless they adapt to the realities of world globalization, it is the globocorps that will govern....

"The old scoring system not only measures the wrong variables, it measures them inaccurately. In the old order, the value of imports was easy to measure: a ship would arrive with X tons of timber or Y yards of cloth. In the new age, wealth springs from service and its kindred knowledge, not things. We trade intangible services impossible to value: engineering, design, marketing ideas, management –

often transferred across national borders within the same globocorp. US customs values a computer tape according to the number of square inches, although the data itself may represent millions of hours of imported man-hours done abroad. Even if the customs service knew its true value, it could not stop it from being zapped across borders by telephone or corporate satellite link, or even be aware that it had happened. Products of the highest value today are invisible and intangible. Nation-states are at a complete loss in the new economy.

"What is the answer? The effective economists of the twenty-first century will start by throwing away nineteenth-century concepts of "nationality," "physical products," and "country of origin," and focus instead on regional development: jobs, training, and local investment. It sounds simple, but economists have few tools to effectively manage our economies in the decades ahead....

"But as power devolves to the most local of levels, many questions remain unanswered. Political scientists, sociologists, and economists have no theories or tools for solving the challenges posed by the Placeless Society. Still unknown is how conflicts will be resolved, or how – and if – the enormous wealth accumulated by the rich in one region will be redistributed to assuage the plight of the poor somewhere else. And if questions of income distribution are not resolved, does it not usher in an age of class warfare, unprecedented global immigration, and terrorism? And how will these tiny microstates solve the larger problems that not even today's nation-states can solve (global pollution, international drug flows, illicit arms shipments)?

"Turning our attention to these areas, we now discover the ultimate paradox of the twenty-first century: while power is devolving, it is also consolidating. While the nation-state is breaking into smaller autonomous units, other powers are coalescing into large supranational blocks. Indeed, placelessness may bring ultimate sovereignty to the only level where conflicts can be resolved, one that offers both the promise of a warless world and the constraints of Big Brothers; where the world's peoples are for once free, but the risk of global tyranny makes that freedom more uncertain....

"The new millennium will mark the devolution of power from the large nation-state to local administrations, and conversely, a shifting of other powers to supranational, even global, authorities.

"In the twenty-first century, we will each retain our "indigenous" cultures, our unique blend of tribal affiliations, some acquired by birth, others chosen freely. Many of us will live in one place for most of our lives and take pride in the local region. Yet our passion for the large nation-state, for which our ancestors fought with their blood, will dwindle to the same emotional consequence of county or province today. A new spirit of global citizenship will evolve in its place and with it, the ascendancy of global governance....

"The North Americans, fearful of being locked out of a united Europe, and needing to react to a global Japan, have formed their own regional trade block in the North American Free Trade Agreement – NAFTA. Through it, the United States, Canada, and Mexico have each yielded some of their sovereignty in exchange for a union expected to increase the standards of living for all.

"Under NAFTA, the three largest North American countries have set up a rudimentary "supergovernment," empowered to resolve disputes among the club members. Cut out of the process are the congresses, court systems, and constitutions of the member countries. In a very real sense, NAFTA is a sovereign government reigning over nearly 400 million people and an economy equivalent to nearly a third of the world's output. Its rules dictate that disputes be submitted to an arbitration panel whose findings supersede the domestic laws of each member nation. For the first time, US, Canadian, and Mexican courts will be bound to enforce the decisions of an international body against its own trade officials....

"We are beginning to learn that in the Placeless Society, trade blocs need not even be contiguous landmasses. We have a new class of "hyperblocs" entirely in the Fourth Dimension, as globocorps continue to grow their webs completely blind to place. The effect is an invisible shuttle flying between blocs, tightening the warp and weft into a single fabric. The United States and Canada are part of NAFTA in North America, but also key members of APEC in the Pacific Rim. Mexico, too, is in NAFTA, but also part of the free-trade Group of Three linking it with Colombia and Venezuela. Chile would "logically" fall in with the Andean Group of Mercosur, but may first join NAFTA centered some 5,000 miles to the north. Brazil, already the anchor for Mercosur, is being courted by both NAFTA, for its American credentials, and the European Union, for its Portuguese and Spanish connections.

"Each piece seems awfully complex, and that is precisely the point. The lines are blurring and liaisons that depend strictly on place become irrelevant. Just as nation-states are already rendered obsolete by global trade, so too are regional trade blocs. The Politicians cloistered in meeting rooms may draw the map of the world however they want, but in reality, Asia and North America are inexorably linked, as are both with Europe and the rest of the world.

"Historians looking back on us today will view regional blocs as a mere stepping-stone toward the world as a trading bloc, perhaps one political unit. In the EU, NAFTA, and elsewhere, countries are now learning to yield sovereignty to supranational bodies, to trade a bit of autonomy (some say in a Faustian bargain) for a higher standard of living and greater regional security. It will only be a matter of time before these blocs, in turn, merge into a whole.

"The formalized consolidation may be already at hand.

"The collapse of the centralized economies of the communist camp have left the world with one model for the engine of economic wealth: capitalism. Economists the world over now understand that in the long term, free trade (even with its temporary displacements of workers) raises general living standards in rich and poor countries alike, and the international trade, when properly done, is a win-win game in which all participating countries benefit (usually through the twin benefits of lower domestic prices and increased export opportunities).

"In response, countries are already positioning for the next step: the world as a single trade bloc. The foundations to such a reordering have already been laid in the pathbreaking World Trade Organization.

"The WTO is a worldwide trade bloc linking 124 nations. Effective in 1995, it was built on the foundations of its predecessor, GATT, to bring it up to date with the new realities of world trade. The eight-year "Uruguay Round" to update GATT demonstrated the need for more than a one-time trading agreement; what was needed was a mechanism to update the agreement on an ongoing basis. The earlier agreement, GATT, had no teeth: countries were flaunting the rules with impunity, "freeloader" countries were taking but not giving; disputes were often never resolved.

"The WTO changed all that by effectively setting up a limited world government with sovereignty over world trade. It has replaced an arcane trading system with a new one regulated by the uniform rule of law, where the mighty nation-states and the tiny ones are treated equally. Under the rules of the WTO, each country has one vote. St. Kitts or Fiji has the same vote as the United States or Japan. Whenever three-quarters of the countries agree, the decision becomes binding on every member of the group, and noncompliance elicits stiff fines, sanctions, or expulsion.

"The WTO is the most expansive free-trade agreement in the world's history, reducing tariffs everywhere on the globe to almost zero, bringing the Age of Everything-Everywhere to the institutional level. It limits government subsidies for basic research, agriculture, and other industries, and provides for much swifter settlement of disputes between members, an overwhelming advantage in reducing regulatory risks of trade.

"These notions are far-reaching, but the most significant aspect of the WTO is that member governments have voluntarily yielded sovereignty over domestic laws governing the environment, food, safety, and way of life. Under the new agreement, one country can challenge any domestic law of another as a restraint on trade. If a three-person WTO tribunal of "experts" agrees, their decision becomes international law, unless the country can somehow convince the hundred or so others to vote against it within sixty days.

"Ultimately, what constitutes an "unfair trading practice" is at the sole discretion of the WTO. Social policies achieved in the twentieth century may be unraveled in the twenty-first. No international law, for example, requires a minimum wage, and therefore products made with sweat-shop labor could not be kept out. So too with products that destroy rain forests or are made with polluting processes. A Geneva-based panel already rules that the US government can no longer restrict tuna caught with methods that kill dolphins.

"Each country is also losing its sovereignty to protect its citizens from imports that may infringe on public safety. Prior to the WTO, the United States could restrict imports of foods carrying traces of dangerous pesticides. Since many countries use these same pesticides widely, is not the American restriction an unfair trade barrier? The Europeans already complain that the US smog-control regulations restrict European auto imports.

"By coaxing the nations of the world to surrender sovereignty freely in exchange for a more regulated marketplace, the World Trade Organization is raised to a level that supersedes the constitutions of each member country. In many ways, its ascendancy represents the triumph of the globocorp over nation-states that are still steeped in a regionalized world. In a very real way, the power vacuum created in the Fourth Dimension has been filled by commercial interests, leaving the politicians behind in its wake.

"Some fear that the WTO will usurp the rights of individual nations to determine their own environmental rules, health, and labor standards. Local, state, and national democratic institutions are jeopardized by faceless bureaucrats more concerned with increasing trade for its own sake than adapting to human and cultural idiosyncrasies.

"The organization is devoid of the checks and balances normal to a modern democracy. When panels on agribusiness meet to discuss pesticides, the interests of commerce, trading companies, and chemical companies will be heavily represented; environmentalists and consumer-safety advocates will likely be shut out as being "ignorant" of the lofty notions of world trade. Meetings behind closed doors will be inaccessible to public review.

"In a very real sense, the WTO is a tyranny of commercialism. The laws at the nation-state level are mature ecosystems that have evolved over centuries. The sudden rise of placelessness, with sovereignty over laws now subject to world bodies, has left us naked. We do not yet have robust international equivalents of national antitrust, consumer protection, air and water pollution, corporate accounting, and minimum wage and labor laws. The WTO, as much as it is needed for trade, has exposed new imbalances in power....

"The question for most people is not whether we need international governance, but to what extent and how the power is to be distributed. If we have laws, who

shall make them? The United States? Japan? The rich countries? The poor ones? And if we set up a broad-based legal body, what form should it take? If the League of Nations and the United Nations failed, will we get it right the third time? And how should it be different...?

"Perhaps what is needed is a world police force with special training and equipment usually not found in armies designed to seize and hold territory. Any global force is likely to need language skills in the areas under patrol. They will need special equipment, transport for refugees, tent cities, prefabricated buildings, generators, mass food-preparation, water-filtration equipment...and guns....

"Because all of this takes money, the present financing system of the United Nations is inadequate. A few countries overpay, many underpay, and too many are in arrears. Financing UN operations has been compared to financial bungee jumping: bold resolutions are passed without the resources to enforce them.

"Global taxes will likely come into being in areas that depend on the maintenance of peace: taxes concerning Antarctica and seafloor mining, fishing, and transport; long-distance aircraft, air freight, and passengers. Look, too, for pollution taxes, particularly on carbon dioxide, fluorocarbons, and other global pollutants. Atomic energy may be taxed, as may be trade in armaments, satellite launchings, orbit slots, microwave bands, telecommunications and global television, and globocorps.

"Diversifying the income stream makes it impractical for one country to sway the world body merely by withholding dues. Global taxation will also match tax receipts to those people or countries most likely to benefit from peaceful global development....

"The need for a world government is clear, but about how to organize its day-to-day details, we do not have a clue. How are task forces formed and objectives defined? How is duplication eliminated? Or should it be? These are important questions because the United Nations of the past has scored low and the needs of the future are high.

"The global government of the twenty-first century is unlikely to be a "World Government" in the Orwellian sense that many of us today visualize. It will not be a singular, monolithic structure hierarchically "superior" to states. We do not need world government; we need world governance – the result, not the institution.

"It is more likely to be interglobal than global, an amalgam of agencies, some international, some governmental, nonprofit organizations and volunteers....

"A successful global governance will have its foundations firmly in the Fourth Dimension, connecting banking regulators in Bonn with Washington and Tokyo, refugee workers in Africa with embassies in Helsinki and Brasilia. It will link the

World Bank with its projects in China and Eastern Europe. During regional disasters or wars, the public will be kept informed of global rescue missions via broadcasts by television and radio; parties the world over will coordinate a focused solution. Access to satellite surveillance will also be needed to watch for shifts in crops and land use, and to forecast likely regions of famine....

"How do we get there from here? To some extent, we are already there. We already have a degree of world governance through the General Assembly, the Security Council, the World Court, the World Trade Organization, the International Monetary Fund, the World Bank, the Universal Postal Union, the International Civil Aviation Organization, the International Labor Organization, the High Commissioner for Refugees, the World Health Organization, and on and on – enough to fill a telephone directory....

"We know that global governance will grow because we are increasingly intertwined and need to seek common solutions to common problems. But is the United Nations the right vehicle...?

"Perhaps some outside threat will unite the world: a riotous stampede of humanity from Africa to Europe, a new Great Depression, a rising sea covering Florida and Bangladesh, fundamentalist terrorism, the horrors of nuclear diplomacy, or a new biological warfare agent. Perhaps it will be something else, some unforeseen combination of factors; we don't know precisely. But we do know that the pace of world change makes certain catastrophes inevitable.

"As world globalization looms, some will hold tightly to a known past rather than yield to an unknown future. Indeed, the twenty-first century is likely to see a rise in terrorism, citizen activism, and clandestine militia as the displaced and the nostalgic seek to fight against powerful currents carrying them downstream. Many of the saboteurs of global governance are glued to road maps drawn in the nineteenth and twentieth centuries. Yet others foresee a growing global bureaucracy, excessive world taxes, intrusive policies, and the prospect of world tyranny. And some of them might be right...." (William Knoke, *Bold New World: The Essential Road Map to the Twenty-First Century*, Kodansha America, Inc., New York, NY, 1996, pp. 6, 15-16, 79-81, 83-84, 87, 138-139, 139-140, 144, 145-147, 149, 151-152, 153, 154, 250-251, 253-254, 257, 263-267, 274, 276, 277, 278, 279-280, 280-281.)

The Triumph of Monopoly Capitalism Throughout the World

We are in the midst of a global capital revolution and revolutions spark strong emotions. Just as the French Revolution led to a fundamental transfer of power and economic transformation, so will the global capital revolution. Is the coming of this revolution good news or bad news? The question remains open.

As the market becomes unbound from the constraints of national governments, it is creating the potential for a tidal wave of global capitalism that could drive rapid growth and highly beneficial integration of the world's real economy well into the next century. There is also a somewhat less probable, but nonetheless significant, chance that the power of this market could turn destructive and unleash financial instability and social turmoil such as the world has not seen since the 1920s and 1930s....

...However, it does not matter whether a national government or a political party likes or dislikes the development of such a powerful global market and the loss of direct control of its domestic economy any more than it matters whether a national government likes or dislikes nuclear weapons. The global market, like nuclear weapons, has become a reality that is too big to ignore, and national policy must reflect this reality....

As this market matures, it will drive a fundamental change in the way the economy works and how the nation state's power is exercised....

Even though the integration of the market is still incomplete, its development is unleashing global capitalism in full force and is already spearheading world economic development and the globalization of the world's real economy.

This is change on a scale quite unlike anything we have seen before. In the future, the global capital market will match supply and demand for capital worldwide and in the process, integrate the economies not just of the developed world, but also the Latin American, Chinese, South Asian, Indian, and Russian economies. This market will be so huge, and its level of activity so extensive, that it will increasingly dictate capital movements and thus capital pricing and allocation. In the process, the world economy will work differently and the political systems of nations will be reshaped.

This revolution will be sufficiently powerful to change the traditional roles of governments. The world will move from closed nationally controlled systems toward one open, global system....

The processes underlying this transformation have been at work for a long time. The mobility of capital and the scale of the global capital market have been developing since the early 1970s. Multinational corporations have been undertaking foreign direct investment since the late 1950s. Local corporations have been importing capital and production techniques from abroad for centuries. In particular, the infrastructure to globalize the world economy – from telecommunications, to information technology, to jumbo jets – has been evolving particularly rapidly in the last twenty years. Finally, the long slow process of educating enough people from various nations and cultures with the language capabilities and the skills to globalize the real economy has been underway since the end of World War II....

... [A] national government has no choice but to move forward to embrace the global capital revolution unless it wants to harm its own citizens, its economy, and its own purposes. We cannot go backward. What has been done cannot be undone without truly destructive consequences....

This global capital market can serve us well provided national governments curtail their appetites for debt and shift their viewpoint from operating in a closed, national system to operating in an open, global system....

Moving from a closed, national system to an open global system changes who bears the risk. In a closed, national system, the nation state absorbs much of the risk. Market forces are tempered by regulation and by direct and indirect subsidies. In an open, global system, each participant bears the risk.

Risk absorption by governments has been more pronounced outside the United States. In the typical European country, product market restrictions have historically shielded businesses and labor from competition. Direct and indirect subsidies have helped individual companies compete in world markets despite having lower productivity than nonlocal competitors. Generous unemployment benefits have protected individuals from economic hardship when jobs are lost. However, because these same restrictions and subsidies have led to lower productivity and soaring government deficits, they are unsustainable, and European nations have begun to dismantle them under the increasing pressure from the marketplace.

This process will cause enormous disruption as governments cut entitlements, particularly pensions and health care, and as businesses dependent on government protection must restructure or perish. These changes, in turn, will lead to large job losses and enormous personal dislocation. There will be high levels of volatility in financial markets and uncertainty about the future.

Industry structures will be under constant siege, particularly in Europe and Japan, as nonlocal competitors enter local markets with state-of-the-art production techniques and as local competitors import nonlocal techniques. All participants will be increasingly competing against the best methods of production in the world. The collision between entrenched local players with "deep pockets" and nonlocal players with huge productivity advantages may lead to structurally depressed returns until new, stable, global industry structures emerge.

The resulting turmoil will be the greatest in Europe, Japan, and the developing countries, but even in the United States, we should expect significant social unrest....

Many of the forces driving the global capital revolution have been operating in a more muted form for nearly two decades. The financial press has been writing about "global capital markets" for some 20 years as if they already existed. The

truth is that we are only at a midstage in the market integration process, and it is only now that we find the pace of change accelerating faster than we find comfortable.

This pace will continue to accelerate and we will all have to adapt. But, all of us have a real barrier to making the necessary changes. We are trapped in obsolete mental assumptions about how the world should work because we grew up in a world dominated by nations and their governments. Now, like it or not, we are becoming citizens of the world.... (Lowell Bryan and Diana Farrell, *Market Unbound: Unleashing Global Capitalism*, John Wiley & Sons, Inc.: New York, Chichester, Brisbane, Toronto, Singapore, 1996, pp. 2, 3, 5, 7, 10, 11,12.)

The Global Ideology of Communism Laid the Groundwork for the Rise of the World Economy

For the first time in human history, anything can be made anywhere and sold everywhere. In capitalistic economies that means making each component and performing each activity at the place on the globe where it can be most cheaply done and selling the resulting products or services wherever prices and profits are highest. Minimizing costs and maximizing revenues is what profit maximization, the heart of capitalism, is all about. Sentimental attachment to some geographic part of the world is not part of the system.

Technologically, transportation and communication costs have fallen dramatically and the speed with which both can be done has risen exponentially. This has made possible completely new systems of communications, command, and control within the business sector....

But ideologies were just as important as technologies in the development of a global economy. When the capitalistic global economy began its development in the immediate aftermath of World War II, the new technologies that are now thought to be essential to a global economy did not yet exist. Ideology sent the capitalistic world off in a global direction that was later reinforced by technology.... Technology accelerated the development of today's global economy, but social attitudes and government actions that flowed from those attitudes created the global economy.

The United States in particular with its history of isolationism could easily have become after World War II the modern equivalent of China's Middle Kingdom. It was wealthy; it was militarily dominant; it had the protection of large oceans to the east and west, and large friendly, militarily weak neighbors to the north and south. Economically, it did not need the rest of the world for anything. It would have been easy for the United States to fall back into its historic isolationism....

In the McCarthy era, Americans made communism into an inside threat and during the cold war Americans saw communism as an outside military threat, but

the reality was that communism was never either an inside threat to take over in America or an outside military force that directly threatened to conquer America. There were inside political threats and outside military threats elsewhere in the world (Italy, West Germany, South Korea), but they were only indirect threats to America if America decided it wanted to be the global leader of the anti-Communist military bloc. If it wanted to retreat into isolation, it was not directly threatened by communism. In the end it was probably the indirect threat global communism posed for global capitalism that tipped the balance away from isolationism to internationalism....

The outside threat, communism, was a one-world ideology. It was an ecumenical, not a national event. In Marx's vision a universal Communist ideology would sweep away national politics and create a unified global social system with worldwide egalitarian standards of living. In his eyes nationalism was one of the key enemies of communism. Attachments to nations would have to be crushed and replaced with one-world communism....

In the aftermath of Sputnik when Khrushchev was pounding his shoe on his desk at the United Nations, when the Soviet Union was believed to be economically growing faster than the United States, when China was the model for development in the third world, and when communism had just come to the Western Hemisphere in Cuba, the global threat to capitalism was taken very serious. One-country capitalistic responses clearly weren't good enough. Something global had to be put in place to contain global communism.

While the Communist world did not become a single country, the existence of a competitive ideology preaching a global approach forced the capitalistic economies into a defensive, you-have-to-be-one-to-fight-one global mentality. Worldwide military alliances were needed. Economic growth outside the United States became more important to the United States than economic growth within the United States, since the United States needed wealthy partners who could afford to share the military manpower burdens that were necessary to contain communism more than it needed to raise its already very high standards of living.

Some of the GATT-Bretton Woods system (the World Bank, the International Monetary Fund [IMF], most favored nation [MFN] trading rules) was designed before the Iron Curtain came down, but its eventual shape (a series of trading rounds dismantling tariffs and quotas, U. S. leadership and management, the United States as a global economic locomotive, and an open American market where everyone could sell their goods) was formed in the heat of the cold war. Having America as a large, open, rich market was particularly important, since it is far easier to become rich by selling things to wealthy people than by selling to poor people. Since there was only one large group of rich people on the face of the earth after World War II, access to U. S. markets was a prize worth winning. The United

States could use that ability to grant or deny access to its market to tie people elsewhere in the world into the American system.

If one looks at the countries that have become rich since World War II, all of them have done through a period of time when their exports focused on the American market. In the 1960s, 35 percent of Japan's exports were coming to America and in the 1980's, 48 percent of the Asian dragon's (Hong Kong, Taiwan, South Korea, and Singapore) exports were coming to the United States. China is doing the same in the 1990s. In the last ten years more than 50 percent of its increase in exports have come to the United States.

Although the Marshall Plan was not formally part of the GATT-Bretton Woods system, the same forces brought it into existence. It brought huge amounts of aid to the formerly wealthy war-torn countries that fought World War II. Both old enemies (German, Japan, Italy) and old allies (Great Britain, France, the Netherlands) had to be rapidly rebuilt to preserve capitalism and to allow them to afford to support the large military establishments necessary to contain communism....

With communism dead, the threats that were instrumental in producing a global capitalistic economy are over. But historic paths make a difference. Whether a global economy would have been built without the presence of a Communist threat can be debated, but that debate does not change today's reality that a global economy exists.... A global economy now shapes everyone's view of the world and alters how each of us thinks. Everyone faces a new reality. Everyone is mutually interdependent and linked in very different patterns of supply and demand that might otherwise have existed. Powerful institutions (world banks, multinational firms, international institutions) are in place with a vested interest in maintaining themselves and their environment. Getting rid of the existing world economy would require some painful structural readjustments. (Lester C. Thurow, *The Future of Capitalism: How Today's Economic Forces Shape Tomorrow's World*. New York: Penguin Books, 1997 edition, pp. 115-119. Originally published in 1996.

Participation in the World Economy Will Require a Substantial Forfeiture of National Sovereignty

With the addition of the second world to capitalism and the decision of much of the third world to play the global capitalistic game, the global economy is both bigger and more of a reality than it ever has been.... The existing trading system – the GATT-Bretton Woods system – was designed for the unipolar world that existed in the aftermath of World War II and not today's multipolar world. It will have to be redesigned for the new multipolar realities, including regional trading blocks....

While the world is not negotiating a global common market, the whole world essentially has the same needs to coordinate and harmonize that exist in the European Community. In Europe ideology is pushing economics; in the world, economics is pushing ideology. But whatever the direction of forces, the place to which one gets pushed is the same.

Cooperative policies are needed to make the global economy work, but cooperation will require the surrender of a lot of national sovereignty. A cooperative Keynesian locomotive sharply limits government's freedom to act independently in the economic sphere. Interest rates and budget balances have to be agreed upon collectively for some set of countries. Microeconomic systems of government regulations have to be harmonized. What is required to make cooperation work is not all that different from what is required to make a formal common market work.

To make a global economy work requires giving up a substantial degree of national sovereignty, but the political Left and Right are both correct when they argue that this is undemocratic. It is undemocratic rule by foreigners or, even worse, rule by international bureaucrats.... (Lester C. Thurow, *The Future of Capitalism*, pp. 131, 138.)

Recommended Books On the World Economy

The books reviewed above provide the reader with a unique glimpse into various aspects of the system of global governance that is being developed by a host of influential and powerful individuals and organizations throughout the world. In order to gain a deeper understanding of the global system under construction and the world economy, the reader should consult the above books, however, this recommendation is not an endorsement of the author's viewpoint.

Part II Introduction

1. Global Governance or Global Tyranny?

The financial history of the 20th century reveals that certain influential and powerful figures in the United States, Europe, Asia and elsewhere have been working in concert to create "a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole." (Carroll Quigley, *Tragedy and Hope*, New York: The Macmillan Company, 1966, p. 324.). These self-perpetuating elites have worked diligently to reshape the globe to meet their long-range objectives and goals. Their first attempt at molding the world was the League of Nations. The League was subsequently followed by the United Nations and its myriad of specialized organizations. Both of these organizations failed to truly unite the world and more especially the Western World.

Creation of a Trilateral Super-State

After years of trial and error the elites in New York, Boston, London, Frankfurt, Paris, Tokyo, etc., have begun a major new thrust at world order or global governance. This attempt at uniting the world is structurally quite different from earlier attempts at global governance and is based on a more realistic understanding of the human-nature tendencies of man and of nationalism. The third try at global governance is not an attempt to create a world government. Rather it is an attempt to create a "new Imperial System" under the domination of an elite financial oligarchy from the United States, Europe, Asia and elsewhere. To be more specific it calls for the creation of a trilateral super-state. The U.S. is to merge with the European Community and Japan initially. Later the advanced communist nations, especially Russia and China, will join the new consort of powers. Together this grouping will literally dominate the nations of the earth. At present the merger of the U.S., Japan and the EC is progressing, especially in the economic sphere through the economic summitry process and the increasingly globalization of multinational corporations through mergers, acquisitions and alliances.

National Sovereignty – an Obstacle to Global Governance

For decades the concept of nationalism and national sovereignty have loomed on the horizon as obstacles to global governance. The elites who have been attempting to guide the nations of the earth into a world state have sought to develop numerous ways to break down the formidable barriers of nationalism and national sovereignty.

In the late 1960s the elites in the various power centers of the world decided that it was no longer possible to gently nudge the world toward global governance.

The elites began calling for a strengthening of existing international institutions and the formation of new organizations at the international level. Gradually, these institutions were to be strengthened until they possessed sufficient power to require compliance by the individual nation-states of the world.

Today such organizations as the Organization for Economic Cooperation (OECD) in Paris, the International Monetary Fund (IMF) in Washington, D.C. and the Bank for International Settlements (BIS) in Basle, Switzerland possess enough power to beckon allegiance not only from the smaller nation-states in the Third and Fourth World, but also from the U.S. and the western nations. The concept of national sovereignty has been carefully eroded through a process known as "piecemeal functionalism." Since 1976 a tremendous amount of U.S. political and economic sovereignty has been transferred to the IMF, OECD and other major international institutions.

The Goals of Global Governance

The machinery for global governance began being laid in the early 1900s with the establishment of the League of Nations and the Bank of International Settlements. Basically, it was felt that if the following goals could be accomplished, the likelihood of a global system of governance or a world state before the 21st Century was a definite possibility.

(1) An international banking fraternity dedicated to the objectives of finance capitalism.

(2) A multinational corporation fraternity dedicated to the objectives of monopoly capitalism and corporate socialism.

(3) The establishment of a global economic system based upon the principles of managed or so-called free trade.

(4) The establishment of international institutions with sufficient power to summon compliance from individual nation-states.

(5) The development of a new set of global governing principles.

(6) A world central bank, an international currency and a system of central banks in each nation on earth.

(7) A global network of institutes of international affairs dedicated to promoting global governance.

(8) A network of tax-exempt foundations with sufficient capital to develop, support and promote global objectives.

(9) The development of a global political party dedicated to global governance.

(10) The support for global governance by leading publishing houses, newspapers, magazines, journals, television, cable, telephone, computer, radio, satellite and telecommunications conglomerates in the advanced nations of the world.

With the successful development and implementation of the above goals the elite planners of the United States, Europe, Asia and elsewhere would be very close to accomplishing their long-term objective of a global political, economic and financial system in the private hands.

A World State That Rivals Ancient Rome

The serious observer of international affairs realizes that the foundation for a world state is firmly laid in place today. The building of a world state may be likened to the construction of a large building. It is being built from the bottom up, piece by piece. Even though it looks like a great "booming, buzzing confusion," the architects of global governance have developed detailed blueprints of their future world state. The great aim is the construction of a global political, economic, and financial system or world state that rivals ancient Rome.

Major Actors in Drive for Global Governance

The major actors in the drive for global governance are key international bankers, investment bankers and leaders of giant multinational corporations. The goal of these powerful individuals is to create a global system of financial control in private hands which would enable them to totally dominate the political structure of each nation-state and the economy of the world, including control of the natural resources of the world. The name of the game played by the elite on a global scale is "Power and Gain," an international version of "Monopoly." The competition among elite rivals throughout the world is intense. Even though there is opposing and competing power struggles throughout the globe, they all share the goal of control of the world economy.

For several decades key players in the international banking fraternity and the multinational corporate fraternity from the United States, Europe, Asia and elsewhere have worked hand in hand to create a truly global system which would enable them to expand their influence, control and power. These groups have consistently sought to create a world economic system.

Global Economic System

With the successful development of the Bretton Woods System in 1945, the elite planners were able to solidify and unite the western world or advanced nations

under one economic system. Presently, there are two economic systems in the world: (1) the modified Bretton Woods System and (2) the Communist System. These two systems are currently in the process of being merged together under the dominance of the recently strengthened and modified International Monetary Fund and other international institutions.

In order to create a global economic system, the elites have sought to remove all nationalistic trade barriers by seeking to lower or remove existing tariff barriers. To facilitate the breakdown of the nationalistic or protectionist walls, they established the General Agreement on Tariffs and Trade (GATT). GATT was merged into the World Trade Organization in 1994.

The world is gradually moving towards one economic system under the control and dominance of certain international institutions. These institutions are in turn controlled and dominated by a select group of elite rulers from the international banking and multinational corporate fraternity throughout the U.S., Europe, Asia and elsewhere.

The Working Center of Global Governance

In order to facilitate the development of a "new Imperial System" or world state, the elite planners of the advanced world have developed numerous international organizations. These include the Organization for Economic Cooperation (OECD) in Paris, the Bank for International Settlements (BIS) in Basle, Switzerland, the International Monetary Fund (IMF) in Washington, D.C., the International Bank for Reconstruction and Development (IBRD) in Washington, D.C. and the World Trade Organization (WTO) in Geneva.

These institutions constitute the working center of global governance, at least from a management point of view. Although they are separate organizations, they cooperate closely together and are the heart of the "new Imperial System." The entire Western World and all the nations which participate in the IMF, OECD, BIS, IBRD and WTO adhere to the international rules and regulations drafted by these international regulatory agencies.

Students of international affairs realizes that for the last few years there has been a great effort by the elite planners to strengthen specific international institutions. Numerous articles, pamphlets and books have been dedicated to the need for greater power being placed in certain supranational institutions. For example, the 1980's Project of the Council on Foreign Relations in New York City, the Triangle Papers of the Trilateral Commission in New York City, the efforts of the Commission on Global Governance in Geneva and others have endeavored to frame the debate on strengthening international institutions.

The Philosophical Foundations of Global Governance

In order to guide the nations and people of the world into a state of global governance it was necessary for the elites in New York, London, Paris, Frankfurt, Tokyo, etc., to support a set of political, economic, social and religious philosophies that would advance their long-term objectives. These philosophies included:

- (1) Elitism
- (2) Atheism.
- (3) Pantheism
- (4) Rationalism
- (5) Secularism
- (6) Marxism
- (7) Higher Criticism
- (8) Relativism
- (9) Darwinism
- (10) Uniformitarianism
- (11) Keynesianism
- (12) Freudianism
- (13) Social Darwinism
- (14) Socialism
- (15) Internationalism
- (16) Finance Capitalism
- (17) Monopoly Capitalism
- (18) Corporate Socialism
- (19) Fascism
- (20) Existentialism

- (21) New Ageism
- (22) Nazism
- (23) Hegelism
- (24) Communism
- (25) Legal Positivism
- (26) Civil Law
- (27) Environmentalism
- (28) Machiavellianism
- (29) Materialism
- (30) Consumerism
- (31) Scientism
- (32) Economic Determinism
- (33) Regimentationism
- (34) Hedonism
- (35) Legalism
- (36) Credentialism

These philosophies pave the way for economic, political, financial and social power to be centralized in the hands of a few, carefully selected individuals – the elite financial planners.

A Global Banking System

In order to facilitate the development of a unified banking system throughout the world in private hands it was felt desirable to establish a central bank system in each nation. Today there exists in every nation a central bank which is controlled by private individuals. In the United States, the central bank is known as the Federal Reserve System. The Bank for International Settlements in Basle serves as the coordinating center for this global network. Once a month the leading central bankers from the advanced world meet at Basle to develop joint strategies and programs.

The elite planners are hopeful that the IMF and the BIS can be successfully transformed into a world central bank. It would in essence be a federal reserve system on a global scale. The new world central bank would be able to create, control and eliminate international liquidity. It would also control the activities of all national central banks and act as a lender of last resort to rescue the elite financial oligarchy when their plans fail or they encounter difficulty in various nations such as occurred in 1994 and 1995 in Mexico.

Influential Institutes of Global Governance

It would have been almost impossible to create a consensus on global governance and world order principles if it were not for influential institutes of international affairs in various parts of the world. Today there are over thirty prestigious institutes throughout the western world. These include:

- (1) Trilateral Commission, New York
- (2) Council on Foreign Relations, New York
- (3) Royal Institute of International Affairs, London, England
- (4) Atlantic Institute for International Affairs, Paris, France
- (5) Institute Affaire Internazionali, Rome, Italy
- (6) Australian Institute of International Affairs, Canberra, Australia
- (7) Japan Institute of International Affairs, Tokyo, Japan
- (8) International Institute for Strategic Studies, London, England
- (9) Canadian Institute of International Affairs, Toronto, Canada
- (10) Guyana Institute of International Affairs, Georgetown, Guyana
- (11) Indian Council of World Affairs, New Delhi, India
- (12) New Zealand Institute of International Affairs, Wellington, New Zealand
- (13) Nigerian Institute of International Affairs, Lagos, Nigeria
- (14) Trinidad and Tobago Institute of International Affairs, Trinidad, West Indies
- (15) Centre D'Etudes et de Recherches Internationales de la Fondation Nationale des Sciences Politiques, Paris, France

- (16) Deutsche Gesellschaft für Auswärtige Politik e.V., Bonn, Federal Republic of Germany
- (17) Institut Français des Relations Internationales, Paris, France
- (18) Institut Royal des Relations Internationales, Brussels, Belgium
- (19) Nederlands Genootschap Voor Internationale Zaken, The Hague, Netherlands
- (20) Det Udenrigspolitiske Selskab, Copenhagen, Denmark
- (21) "Österreichische Gesellschaft für Außenpolitik und Internationale Beziehungen, Vienna, Austria
- (22) Institut za Međunarodni Odnosienia i Sotsialistički Integratsia, Sofia, Bulgaria
- (23) The Chinese People's Institute of Foreign Affairs, Peking, China
- (24) Magyar Külügyi Intézet, Budapest, Hungary
- (25) World Affairs Council, Amman, Jordan
- (26) Norwegian Institute of International Affairs, Oslo, Norway
- (27) Pakistan Institute of International Affairs, Karachi, Pakistan
- (28) Polish Institute of International Affairs, Warsaw, Poland
- (29) L'Association de Droit International et de Relations Internationales de la République Socialiste de Roumanie, Bucharest, Romania
- (30) South African Institute of International Affairs, Johannesburg, South Africa
- (31) Utikespolitiska Institutet, Stockholm, Sweden
- (32) The Graduate Institute of International Studies, Geneva, Switzerland
- (33) Institute of World Economy and International Relations, Academy of Sciences of Russia, Moscow, Russia
- (34) Institute of International Politics and Economics, Belgrade, Yugoslavia

These powerful organizations are comprised of the leading elites in each nation or region where they are located. Although separate, these institutions cooperate with each other on many projects, etc.

The Tax-exempt Foundation World

Beginning in the early 1900s in America and at slightly later dates in Europe, there arose huge tax-exempt foundations whose real goals were to promote internationalism and global governance. In America, the Ford, Rockefeller and Carnegie Foundations paved the way for the introduction of the above mentioned principles of global governance. In Europe, the German Marshall Foundation and others lead the way. This was accomplished by the channeling of literally billions of dollars to individuals and organizations which developed, upheld and implemented the goals, philosophies and objectives of the ruling elite whose fortunes they were beholden for support.

A Global Political Party

A global political party was established when the Trilateral Commission was established in July of 1973. Members of the Commission currently occupy important positions in the United States, Europe and Japan.

The Establishment's Media Outlets

The assistance of leading film studios, newspapers, publishing houses, television, cable and radio stations was felt essential if the goal of global governance was ever to be realized. Therefore, it became necessary for the elite planners of the western world to gradually induce the leading owners and figures in major communication outlets to support the objectives outlined previously. Today CBS, NBC, ABC, *Time Magazine*, *The Washington Post*, the *New York Times*, *Foreign Affairs*, etc., constitute the elites' greatest media outlets.

Global Governance or Global Tyranny?

Although many outstanding people have been persuaded that the elite principles of global governance will help to bring about greater international unity and cooperation, or a new civilization, numerous people feel that the entire planet stands on the brink of the greatest tyranny the world has ever seen. If we continue to follow the current philosophies advocated by the elite planners, will it lead to peace and prosperity or will it lead to a loss of freedom, tyranny, bondage, misery, war, oppression, economic chaos, and eventually anarchy on a global scale?

Compartmentalization of Thinking

In the intelligence community information is compartmentalized and restricted to prevent sensitive data, photographs, documents, files, etc., from falling into the

wrong hands. This procedure prevents all but those at the top of the agency from seeing the whole picture. This same type of compartmentalization occurs in nearly all phases of our lives. It applies to the study of law, university studies, medicine, etc. As we proceed through our educational studies and through life we tend to compartmentalize our thoughts and focus on the subject before us. While this is entirely normal, it does prevent us in many cases from seeing the global picture at times.

The Need for a Major Debate on Global Governance

The purpose of this volume is to present an overview of the world management system currently in place and the global community that is emerging along with its future goals and plans in order to stimulate debate concerning its development and implementation. It contains a series of essays and interviews written and conducted over a period of eighteen years.

In order to gain a clearer picture of the emerging global community we will need to traverse the subjects of international finance, international trade, international relations, international organizations, nation-state governance, central banking policies, international educational policies, the world of the large tax-exempt foundations, politics, economics, science, philosophy, social engineering and much more. It is an exciting and highly rewarding adventure, however, the reader may encounter information which will challenge his former worldviews.

Part III The Engineers of Global Governance

2. Multinational Corporate Directors: The Takeover of the World

Part I – Introduction

Three of the most powerful groups on the earth today are international bankers, investment bankers, and multinational corporate directors. For centuries these groups have dominated, to a significant degree, the economic, political and social development of the world. These three groups of individuals have arisen side by side and are now seeking to control the earth and its resources. The large global corporations through monopolistic practices have gradually gained control of every major industry in the world. The international banks have financed the development of these large corporations as well as their own development through similar monopolistic practices. Influential investment bankers sitting on boards of both banks and corporations have through the process of interlocking directorates successfully engineered the construction of what resembles a giant world corporation. The working relationship of these three groups is almost impossible to divide or distinguish. The Rockefeller, Morgan, Rothschild, Warburg, Du Pont, Barings, etc., empires are so large, so complex, and so intertwined that it would not be stretching the imagination too far to describe these economic empires as one large corporation, although legally they are separate. The long range goal of these three interlocking groups of prominent and powerful individuals is "nothing less than to create a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole." (Carroll Quigley, *Tragedy and Hope*, The Macmillan Company, New York, 1966, p. 324.)

The Total Subjection of the Earth

The combined power of these individuals as they operate closely together is tremendous indeed. They created and now control every major international institution in the world. They have effective control over every major industrial nation in the West. They financed the development of Russia and China and continue to subsidize them. They have completely subjugated the Third and Fourth World nations. They control the academic world, the major media and publishing companies, as well as every dominate business on earth. Their long-range goal is total subjugation of the earth, its people and resources. This description almost sounds like an episode out of a James Bond movie, nevertheless, the facts or evidence indicates that these groups are working closely together to achieve the above goal. Their success is unrivaled in the history of the world. Never before have the inhabitants of this earth been placed in a more precarious position. The incredible irony of this world power structure is that very few believe in its existence and even less understand how it operates today. In the remainder of this book, an attempt will be made to provide the reader with an overview of the elite,

global power structure operating on the earth. This section will deal extensively with the multinational corporate directors.

Part II – Managing the World as an Integrated Unit

Richard J. Barnet and Ronald E. Muller, two renowned critics of multinational companies and their influence on today's world, outlined the goals and practices of the global corporations in 1974 when they published a book entitled, *Global Reach: The Power of the Multinational Corporation*. In a chapter entitled, "The World Managers," they noted:

"The men who run the global corporations are the first in history with an organization, technology, money, and ideology to make a credible try at managing the world as an integrated unit. The global visionary of earlier days was either a self-deceiver or a mystic. When Alexander the Great wept by the riverbank because there were no more worlds to conquer, his distress rested on nothing more substantial than the ignorance of his map maker. As the boundaries of the world expanded, a succession of kings, generals, and assorted strong men tried to establish empires of ever more colossal scale, but none succeeded in making a lasting public reality out of private fantasies. The Napoleonic system, Hitler's Thousand-Year Reich, the British Empire, and the Pax Americana left their traces, but none managed to create anything approaching a global organization for administering the planet that could last even a generation.... The global corporation is the first institution in human history dedicated to centralized planning on a world scale...." (*A Touchstone Book*, New York, Simon and Schuster, 1974, pp. 13-14.)

According to Aurelio Peccei, a director of FIAT, the global corporation is "the most powerful agent for internationalization of human society." The world managers view the earth as one economic unit. In their world view the individual nation-state is an obstacle to global planning and administration of the earth, its people and resources. Zbigniew Brzezinski, former Director of the Trilateral Commission, demonstrated this view when he said:

"The old framework of international politics – with their spheres of influence, military alliances between nation-states, the fiction of sovereignty, doctrinal conflicts arising from 19th Century crisis is clearly no longer compatible with reality. The nation-state as a fundamental union of man's organized life has ceased to be the principal creative force; international banks and multinational corporations are acting and planning in terms that are far in advance of the political concepts of the nation-states. (*Boston Herald America*, August 4, 1976.)

The Future of the World Will Be Shaped by Commercial and Financial Figures

Today there are powerful forces operating to bridge the political cleavages which exist in the world. The most important institutional force to gain total

predominance in the days and years ahead is the multinational corporation. In fact, if history is a reliable guide, we can safely predict that the world of the future will continue to be shaped not by diplomats and government officials but by commercial and financial figures. C. M. van Vlierden, former executive vice president of Bank of America, NT & SA, outlined the following scenario in remarks in 1970:

"I am . . . heartened by the economic institutions that are being created and the economic forces operating to bridge the political cleavages. In particular, I am referring to the International Monetary Fund, the World Bank, the International Finance Corporation, the General Agreement on Tariffs and Trade, the multinational corporations, and private international banks. These and other institutions such as regional trade or economic units demonstrate that there is a growing emphasis on certain types of international cooperation along side the reemergence of state nationalism.

"In this environment there is reason to believe that the world of the future will be shaped by commercial and financial statesmen rather than diplomats and politicians. And this means that the world of the future will be built from the bottom up, piece by piece. We may not be able to visualize exactly where we will be by the end of the century, but there is substantial reason for optimism. If we can harness these economic forces with the dynamism created by scientific and technological advances, we could find ourselves riding the crest of a new economic advance. I would remind you that the industrial revolution and the creation of the British Empire... were products of... convergency of economic and social forces....

"The multinational corporation will be the most important new institutional form of the next quarter century.

"In the coming twenty-five years, we can expect a shift from influence by the nation-state to a new and growing influence by private, profit-motivated entrepreneurial organizations and supranational economic institutions which together can surmount present strictures of limited geography or limited (and often unrealistic) political programs of single nation-states. . . . "(New Era for International Banking and Finance," manuscript copy. Bank of America NT & SA, San Francisco, 1970.)

The Strongest Integrating Factor in the World Economy

At another time, C. M. van Vlierden explained:

"The multinational corporation is perhaps the strongest integrating factor in the world economy today. Its role as the primary transmitter of technological innovation is familiar to you all. Anyone with the least notion of what a Eurodollar is realizes that the multinational corporation, together with its banking counterparts, has integrated the money and capital markets of the world to a degree

never before imagined, not even in the heyday of the international gold standard. . . ." ("Prospectives on the Changing World Business Environment," manuscript copy, Bank of America NT & SA, 1973, San Francisco.)

Managing the World

The global corporations over the last two hundred years have gradually evolved into powers more formidable than the nation-state. It is now the institutional mechanism which the elite of the earth plan to utilize to "manage" the world. Jacques G. Maisonrouge, chairman and chief executive officer of the IBM World Trade Europe/Middle East/Africa Corporation outlined this goal as follows:

"Some of us . . . perceive the international company . . . as a prophetic forerunner of a better world. . . . [It is] the engine primarily responsible for powering our global economy.

"It may not be especially insightful to observe that the destinies of nations have become inextricable tied to each other. . . . And if it is still useful to remember that the world we live in is growing smaller all the time, it may also be to the point to recall that astronomers have characterized Earth as a fifth-rate planet revolving around a third-rate star in a second-rate solar system tucked away in a remote corner of the Universe.

"But it is the only world we have and to manage this speck of cosmic dust in such a way that its inhabitants can live decently, with dignity and in peace, each with his fair share of what the world has to offer, is extremely challenging work, worthy of our best efforts. It is my contention that no better tool has yet been devised for realizing these goals than the international company. . . . ("How a Multinational Corporation Appears to Its Managers.", *Global Companies: The Political Economy of World Business*, edited by George W. Ball, Englewood Cliffs, New Jersey: Prentice-Hall, Inc., 1975, p. 12.)

Part III – Transformation of the Nation-State

As the world moves into a stage of global planning under global managers the significance of the nation-states will continue to dwindle into the status of "administrative units." Concerning this evolving process, Jacques Maisonrouge noted:

"For business purposes the boundaries that separate one nation from another are no more real than the equator. They are merely convenient demarcations of ethnic, linguistic, and cultural entities. They do not define business requirements or consumer trends. Once management understands and accepts this world economy, its view of the marketplace – and its planning – necessarily expands...." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, p. 14.)

Global Corporations are Transforming the World

The effort of the "international process" brought about by the global corporations is bringing about a tremendous transformation of the world – economically, politically and socially. Professor Joseph Hye outlined the transformation now underway as follows:

"The optimistic view sees the growth of the multinational corporate autonomy as having a profound potential for transforming world politics. . . . As corporations grow in autonomy, they will transform world politics from a contest among states into a broader game with more actors who focus on primarily welfare-oriented goals. Multinational corporations will become a vehicle by which mankind transcends the nation-state, our dominant international institution of the past four centuries. States will not cease to exist, but transnational production units will replace a large part of their role in providing citizen's welfare and will claim a proportionate share of their loyalties. These broadened economic domains will call forth new political institutions that go beyond the nation-state.

The Multinational Corporation is Tying the World Together

"The optimists see the multinational corporation tying the world together in a meaningful way. It shifts industrial production toward the poorer parts of the globe. It transfers technology and managerial resources from advanced to less developed countries. It promotes both regional and global economic integration. *The Economist* of London has predicted, for example, that by the end of the century, most automobile and machinery production will be carried out in less developed countries. As it becomes politically difficult to bring workers from poor countries to jobs in rich countries, multinational corporations will promote global economic integration by taking the jobs to the workers.

"The multinational corporation may also help to erode the great ideological cleavage that divides the world. Already there are more than one thousand agreements between Western corporations and Communist countries. Many of these are simple arrangements for 'turnkey' plants. A multinational corporation builds a plant, turns it over to the Communist government, and is paid out of future production. But a number of Communist countries in Eastern Europe have found that longer term managerial involvement by the multinational corporation is a better way to insure continuous inputs of managerial and technological resources. Now some Eastern European governments have followed this logic a step further and have invested abroad, often in joint ventures with multinationals. Such decisions reflect the view that high growth rates depend on access to world markets and the latest generation of technology. The only way to insure access to both is not merely to be a host country, but to participate fully in the global information systems that provide multinational corporations with many of their advantages. Should this trend continue, it would require ideologists to reinterpret their view of

imperialism as the transfer of labor's surplus value across national borders and raise questions about simple equations of multinational corporations, capitalism, and imperialism.

A New Form of International Organization

"Looking further ahead toward the end of the century, it is possible that the multinational corporation will itself evolve into a new and flexible form of functional international organization. Not only will Eastern European governments participate, but with increasing politicization of the question of control of multinationals in their former home countries, demands may increase for government, labor, or consumer group representation on their management boards. Large segments of world industrial production will be managed by large public and quasi-public multinational corporations as well as a host of smaller private ones. Autonomous management (regardless of ownership) will provide flexibility and efficiency in the reorganization of global production. Questions of public vs. private ownership will have been transcended. Only questions of managerial autonomy vs. democratic control will remain.

"Pessimists share with optimists many of these projections of the future of the corporations, but they see the malign effects prevailing over the benign. The economic benefits of global integration will be unevenly spread and some areas will gain very little. The resulting inequality is likely to breed conflict. Moreover, even if multinational corporations distribute industrial production more evenly about the globe than is now the case, they will tend to centralize strategic decisions in regional coordinating centers and at global corporate headquarters. As Stephen Hymer put it, high level decision-making about what technologies and which areas to develop will be taken in a few key cities in the advanced countries, surrounded by regional sub-capitals, while the rest of the world will be confined 'to lower levels of activity and income, i.e., to the status of towns and villages in a new Imperial System. . . ." (George W. Ball, editor, *Global Companies, the Political Economy of World Business*, Englewood Cliffs, New Jersey: Prentice-Hall, Inc., 1975, pp. 162-163.)

Part IV – Integration of the World

From the above quotes it is obvious that a "new Imperial System" is being constructed. The chief architects are influential international bankers, investment bankers, and global corporate directors. The earth will no longer be managed by nation-states or national governments. Instead, it will be governed by the elites who own and control the global companies. The managers of the global corporations will in turn control the international institutions which have been or will be established to maintain the "new Imperial System." The nation-state will be down-sized to an administrative unit and finally phased out of existence altogether if the long range plans of the global elites ever fully materialize. Many a scholar

feels that this scenario is decades or even centuries ahead, however, this is not true. Every nation-state or government on earth is already playing the role of an administrative unit for the global power team which is governing the earth today. Every government in the Third and Fourth World nations, is controlled indirectly by these forces. Russia and China are under the domination of this power structure also. The advanced nations of the Western world have been dominated to the degree that every major or key position, cabinet office, etc., is filled with individuals who are proponents of the developing "new Imperial System."

Powerful Economic Forces Have Been Integrating the World

The earth is now being managed by groups of individuals from the prominent fields of international banking, investment banking, and international business. Powerful economic forces have been integrating the world for decades. Professor Eugene V. Rostow elaborates on this integrating process as follows:

"Through twenty-five years of imaginative cooperation, the bankers, businessmen, trade unions, economists, and governments of Western Europe, North America, and Japan created an economic system of a kind which has been unknown since 1914: a closely unified economy of the industrialized nations. That economy functions as the nucleus of a far-reaching and progressive Western economic order, embracing many smaller industrialized nations, and large parts of the Third World as well. It is rapidly drawing the economies of many communist nations into its orbit.

"The Western economic system is both planned and decentralized: directed, but also flexible. It is planned through the use of fiscal and monetary policies to maintain high levels of demand. And it is decentralized through its reliance on the responses of competitive markets to economic opportunities.

The Economies of Western Europe, North America and Japan are Being Integrated at an Accelerating Rate

"The fundamental economic problem which has emerged in the development of the Western international economy is structural. The economies of Western Europe, North America, and Japan are being integrated at an accelerating rate by irreversible flows of trade, capital, entrepreneurship, tourism, technology, and security expenditures. They have become a single economy in practice. But their economic activities are now more completely and effectively integrated than their institutions for economic control, and particularly their institutions for monetary management. Purely national monetary institutions and policies have lost their capacity to govern the economic relations among the key nations themselves, and their collective relations with many other nations, notably, but not exclusively, with the nations producing oil. The sheer volume of transfers required by the scale and complexity of international economic transactions today makes it impossible to manage monetary policy through a few phone calls and swaps among the central

bankers, and an occasional secret weekend at agreeable country houses in France or Britain. Such methods worked well between 1945 and 1971. They collapsed in 1971 because of human mistakes, and, more fundamentally, because they were no longer adequate to the magnitude of the problem. Strong social and political forces rebelled against constraint. The integrated Western economy lacked a gyroscope. It had become more and more vulnerable.

Structural Weakness of Western Economic System

"This structural weakness of the Western economic system – its failure thus far to establish workable machinery for collective monetary management – is the principal reason why inflation has become so endemic, and so dangerous, even in the relatively stable societies of the industrialized nations.

"We are only beginning to realize how complex an organism a modern economy is, and how difficult it is to predict or control its responses to a given set of changes in the direction and volume of spending. The economic order, as we see only too clearly now, is not a mathematical model governed by a computer." (George Ball, *Global Companies*, pp. 114-116.)

Part V – The Extraordinary Power of the Global Corporations

The impact of global corporations on the earth's governmental systems as well as the people is just beginning to be seriously debated by critics. Political scientists and geopolitical analysts have just recently become aware of the necessity of coupling studies of international finance and business together. Without a study of the "real" moving forces in international affairs, political scientists have failed dramatically in their assessments of political events, governmental systems and the future. In other words, their evaluations, comments, and analysis, have been amiss because they knew almost nothing about international finance and international business which are the key areas for understanding global economics and politics. Political scientists have erred by studying just government figures or policies. These men, no matter how influential they appear, are simply instruments of the global managers.

The Tremendous Power of Global Companies

Richard J. Barnet and Ronald E. Muller pointed out the tremendous power of the multinationals when they noted:

"The rise of the planetary enterprise is producing an organizational revolution as profound in its implications for modern man as the Industrial Revolution and the rise of the nation-state itself. The growth rate of global corporations in recent years is so spectacular that it is now easy to assemble an array of dazzling statistics. If we compare the annual sales of corporations with the gross national product of countries for 1973, we discover that GM is bigger than Switzerland, Pakistan, and

South Africa; that Royal Dutch Shell is bigger than Iran, Venezuela, and Turkey; and that Goodyear Tire is bigger than Saudi Arabia. The average growth rate of the most successful global corporations is two to three times that of most advanced industrial countries, including the United States. It is estimated that global corporations already have more than \$200 billion in physical assets under their control. But size is only one component of power. In international affairs Mao's dictum that political power grows out of the barrel of a gun shocks no one. To those who question power, corporate statesmen like to point out that, like the Pope, they have no divisions at their command. The sources of their extraordinary power are to be found elsewhere – the power to transform the world political economy and in so doing transform the historic role of the nation-state. This power comes not from the barrel of a gun but from control of the means of creating wealth on a worldwide scale. In the process of developing a new world, the managers of firms like GM, IBM, Pepsico, GE, Pfizer, Shell, Volkswagen, Exxon, and a few hundred others are making daily business decisions which have more impact than those of most sovereign governments on where people live; what work, if any, they will do; what they will eat, drink, and wear; what sorts of knowledge schools and universities will encourage; and what kind of society their children will inherit.

The Most Revolutionary Aspect of the Planetary Enterprise

"Indeed, the most revolutionary aspect of the planetary enterprise is not its size but its world view. The managers of the global corporations are seeking to put into practice a theory of human organization that will profoundly alter the nation-state system around which society has been organized for over 400 years. What they are demanding in essence is the right to transcend the nation-state, and in the process, to transform it." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 15-16.)

The World is Viewed as One Economic Unit

Barnet and Muller outlined the role being played by the global companies and their impact on the nation-state when they said:

"What makes the global corporation unique is that unlike corporations of even a few years ago, it no longer views overseas factories and markets as adjuncts to its home operations. Instead, as Maisonrouge puts it, the global corporation views the world as 'one economic unit.' Basic to this view, he points out, 'is a need to plan, organize, and manage on a global scale.' It is this holistic vision of the earth, in comparison with which 'internationalism' seems parochial indeed, that sets the men who have designed the planetary corporation apart from the generations of traders and international entrepreneurs who preceded them.

The True Power of the Global Corporation

"The power of the global corporation derives from its unique capacity to use finance, technology, and advanced marketing skills to integrate production on a

worldwide scale and thus to realize the ancient capitalist dream of One Great Market. This cosmopolitan vision stands as a direct challenge to traditional nationalism. Indeed, the world's leading corporate managers now see the nation-state, once the midwife of the Industrial Revolution, as the chief obstacle to planetary development. 'The political boundaries of nation-states,' declares William I. Spencer, president of the First National City Corporation, which does business in 90 countries, 'are too narrow and constricted to define the scope and sweep of modern business.' For George Ball the world corporation 'is planning and acting well in advance of the world's political ideas' because it is 'a modern concept, designed to meet modern requirements.'

The Nation-State is a Very Old Fashioned Idea

"The nation-state, unfortunately, 'is a very old-fashioned idea and badly adapted to our present complex world.' A true world economy, says John J. Powers, president of Pfizer, echoing Ball, 'is no idealistic pipe dream but a hard-headed prediction: it is a role into which we are being pushed by the imperatives of our own technology.'

The National State is Obsolete

"Even more blunt an attack on the nation-state comes from Maisonrouge of IBM. 'The world's political structures are completely obsolete. They have not changed in at least a hundred years and are woefully out of tune with technological progress.' The 'critical issue of our time,' says Maisonrouge, is the 'conceptual conflict between the search for global optimization of resources and the independence of nation-states.' Business International warns its corporate clients in a 1967 Research Report: '...the nation state is becoming obsolete: tomorrow ... it will in any meaningful sense be dead – and so will the corporation that remains essentially national.'

An Attack on the Nation-State More Radical Than Anything Proposed by the World Federalists

"A little more than a generation after the withering of the wartime dream of world brotherhood – 'Globaloney,' in Clare Boothe Luce's epitaph for Wendell Willkie's 'One World' – a new breed of globalists have launched an attack on the nation-state more radical than anything proposed by World Federalists, U.N. enthusiasts, or other apostles of 'woolly-headed internationalism' who traditionally cause dismay in boardrooms and country clubs. The men who run the global corporations, aware that ideologies, like crackers, travel well only if skillfully packaged, are putting great energy into marketing a new gospel of peace and plenty, which has more potential to change the face of the earth than even the merchandising miracles that have brought Holiday Inns and Pepsi-Cola bottling plants to Moscow and Pollo Frito Kentucky to Latin America. Jacques Maisonrouge likes to point out that 'Down with Borders,' a revolutionary student

slogan of the 1968 Paris university uprising – in which some of his children were involved – is also a welcome slogan at IBM.

A New Generation of Planetary Visionaries

"The new generation of planetary visionaries, unlike globalists of earlier days, come to their prophetic calling not by way of poetic imagination, transcendental philosophy, or Oriental mysticism but by solid careers in electrical circuitry, soap, mayonnaise, and aspirin. But they proclaim the heavenly city of the global corporation with the zeal of a Savanaarola. For Roy Ash, the former head of Litton Industries, later Nixon's budget director and chief consultant in managerial matters, the world corporation represents a 'transcendental unity.' It is the wave of the future, 'for nothing can stop an idea whose time has come.'

The Vision of a World Without Borders

"Men like Ash know that their vision of a world without borders is the most important product they have to sell, for the extraordinary role they are proposing to play in human affairs challenges what Arnold Toynbee calls 'mankind's major religion, the cult of sovereignty.' What we need, Pfizer's president, John J. Powers, told a business gathering some years ago, is 'philosophers in action' to explain 'the promise of the world corporation.' David Rockefeller, chairman of the Chase Manhattan Bank, calls for a massive public relations campaign to dispel the dangerous 'suspicions' about the corporate giants that lurk in minds not yet able to grasp an idea whose time has come.

A Massive Public Relations to Promote a World Without Borders

"The rhapsodic tone which the new globalists have developed in their celebration of the global corporation as 'the instrument of world development,' 'the only force for peace,' 'the most powerful agent for the internationalization of human society,' or, in the words of Dean Courney Brown of the Columbia Business School, the 'prologue to a new world symphony' is no doubt attributable in part to the salesman's traditional weakness for puffing. But more important, the hard sell of the global corporation, now being promoted in hundreds of industry speeches and industry-sponsored studies and by elaborate lobbying activities, such as that of the Emergency Committee for American Trade, reflects deep and growing customer resistance on many levels.

There Will Be No Integrated World Economy Without a Radical Transformation of the Obsolete Nation-State

"The managers of the global corporations keep telling one another that there can be no integrated world economy without radical transformations in the 'obsolete' nation-state; but however progressive a notion this may be, those who depend on the old-fashioned structures for their careers, livelihood, or inspiration are not

easily convinced. The Executives who run the global corporations have persuaded themselves that they are far ahead of politicians in global planning because political managers are prisoners of geography. As much as the mayor of Minneapolis or Milan or Sao Paulo may aspire to a planetary vision, his career depends upon what happens within his territorial domain. Rulers of nations exhibit a similar parochialism for the same reasons. They are jealous of their sovereign prerogatives and do not wish to share, much less abdicate, decision-making power over what happens within their territory.

The Role of the World Manager

"The new globalists are well aware of the problem. 'Corporations that buy, sell, and produce abroad,' says George Ball, 'do have the power to affect the lives of people and nations in a manner that necessarily challenges the prerogatives and responsibilities of political authority. How can a national government make an economic plan with any confidence if a board of directors meeting 5,000 miles away can be altering its pattern of purchasing and production affect in a major way the country's economic life?' But the World Manager's answer to the charge of being a political usurper is not to deny the extraordinary power he seeks to exercise in human affairs but to rationalize it.

"David Rockefeller has called for a 'crusade for understanding' to explain why global corporations should have freer rein to move goods, capital, and technology around the world without the interference of nation-states; but such a crusade calls for the public relations campaign of the century. Perhaps the logic of One World has never been so apparent to so many, yet the twentieth century is above all the age of nationalism. There has been no idea in history for which greater numbers of human beings have died, and most of the corpses have been added to the heap in this century. The continuing struggle for national identity is the unifying political theme of our time. The imperial architects of Germany, Italy, and Japan; the guerrilla leaders of liberation movements, Tito, Ho, Castro; and those who are still fighting to free Africa from colonial rule have all been sustained by the power of nationalism. 'The nation-state will not wither away,' the chairman of Unilever, one of the earliest and largest world corporations, predicts. A 'positive role' will have to be found for it. . . ." (Barnet and Muller, *Global Reach*, pp. 18-21.)

Part IV – Monopolistic Practices of the Global Corporations

One of the most distinguishing features of the multinational corporations is their monopolistic structure. The global companies have effectively obtained control over the predominate areas of production, financing, and marketing. Barnet and Muller outlined the monopolistic aspects of the global corporations as follows:

"Some observers, such as Professor Howard Perlmutter of the Wharton School, estimate that by 1985, two hundred to three hundred global corporations will control eighty percent of all productive assets of the non-Communist world. Even

the more modest predictions are staggering. Judd Polk, senior economist of the U.S. Chamber of commerce calculates that by the turn of the century a few hundred global companies will own productive assets in excess of \$4 trillion, or about fifty-four percent of everything worth owning for the creation of wealth. . . . (Richard J. Barnet & Ronald E. Muller, *Global Reach*, p. 26.)

The Oligopolistic Competition of the Global Companies

It is not impossible to imagine that by the year 2010 that one hundred or less global corporations will own seventy-five percent of the earth's resources and assets. In twenty-five years or so (c. 2025 A.D.), we might witness total control of the earth by less than fifty corporations. Barnet and Muller explained the interesting process whereby the giant global companies maintain their monopolistic practices:

"In the developed world, the problem is different. There established companies compete for greater shares of a relatively stable market through innovation and advertising. Companies such as the Big Three auto makers, the big television producers, and the big computer makers compete with one another, contrary to the model of perfect competition celebrated in classical economic theory, not by seeking to undercut one another in price, but by means of what economists call Oligopolistic competition. Oligopolies are rather like clubs. (All it takes to be a member is to be of sufficient size.) In any industry a handful of companies compete for ever-larger shares of the market according to certain well-established but unstated rules. The principal rule is that price competition, except on very limited occasions, is an antisocial practice to be strictly avoided, since it threatens to destroy the whole club. Once started, the process of retaliatory price cuts has a way of spiraling out of control. Similarly, the products offered by members are more or less identical; introducing radically new technology is considered unsporting. Thus the essential interchangeability of Fords, Chevrolets, and Plymouths; RCA's, Zeniths and Hitachis.

Admittance to the Oligopolistic Club

"Occasionally, a small company such as the Haloid Company, which invented xerography, will gain admittance to the club by bringing off a significant technological breakthrough. But while the managers of high-technology industries confidently predict new technological revolutions around the corner and like to twit doubters by pointing out that the U.S. Commissioner of Patents resigned in 1883 because there was nothing left to be invented, oligopolists seldom challenge one another to a technology race. Instead they compete in the less volatile arenas of cost cutting (through automation and the removal of factories to low-wage areas) and product differentiation (beating out the competition by means of more attractive and convenient packaging and more arresting advertising). . . .

The Challenge of Global Oligopolies

"The driving force behind Oligopolistic competition is a compulsion toward growth; corporate expansion, which Charles G. Mortimer of General Foods calls 'a law of nature,' is the essential strategy for maintaining or increasing market shares. From the perspective of General Foods, the cry to limit growth from environmentalists, from 'zero-growth' economists, from people who feel crowded on the highways or drowned in goods, is 'unnatural': 'bigness' is 'a great force for good.' Robert W. Johnson, a recent chairman of Johnson & Johnson pharmaceutical, also believes that 'a nation as well as a business that does not grow will go back to the Dark Ages. The price of lethargy is slavery.' Oligopolists cannot seek a comfortable plateau on which to rest. For the management of global oligopolies, the alternatives are to maintain, or preferably to wrest, an ever-larger share of the market from the other club members or to face a vote of no confidence from the stock market.

The Definition of an Oligopoly

"Almost by definition, a company with sufficient resources to integrate its activities on a global scale is an oligopoly. Thus IBM controls about 40 percent of the world computer market. Seven oil companies, known as the 'seven sisters,' control over two-thirds of the world's oil and natural-gas supply; the top three U.S.-based automakers have captured well over 50 percent of the world market. Ford, General Motors, National Biscuit, Du Pont, Dow, Bayer all enjoy an Oligopolistic position in the U.S. market. Each makes literally hundreds of products which only a few other giants can match. In the underdeveloped countries, as we shall see, the Oligopolistic position of a few companies is even more dramatic. In Chile, for example, in the late 1960's 22 global firms controlled over 50 percent of seven crucial industries, and all but three were monopolies or oligopolies. . . ." (Richard J. Barnet and Ronald E. Muller, *Global Reach*, pp. 32-34.)

Part VII – The Corporate Attack on Nationalism

A tremendous integrating process is occurring on the earth. Not only are large corporations swallowing up smaller ones, but the economics of the world are now practically one. East is merging with West, and North with the South. The global companies, as noted before, are the agents and promoters of a single world economy. Barnet and Muller exclaim:

"The global corporation is the ideal instrument for integrating the planet, the world managers contend, because it is the only human organization that has managed to free itself from the bonds of nationalism. . . ." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, p. 56.)

The Elimination of the Nation-State

Since the end of World War I and the failure of the establishment of the League of Nations, there has been a concerted and persistent attack on the concept of nationalism by international bankers, investment bankers, and corporate directors. The elimination of the nation-state and the creation of a single economic unit managed by the global elite power structure has been a long-range goal. Barnett and Muller outlined the corporate attack on nationalism as follows:

"On January 6, 1971, 64 top executives of global corporations, including 38 presidents and chairmen of the board, met in Jamaica under the auspices of Business International 'to consider the subject of corporate response to anti-foreign nationalism.' The confidential discussion paper prepared for this 'Chief Executive Officers Roundtable' gives a revealing picture of how the World Managers see the problem of nationalism and what they propose to do about it. 'International corporations,' the paper begins, 'are losing a battle crucial to their profitability, to their growth, and conceivably to their survival. They are losing it to important segments of society that, since childhood, have been surrounded by notions that a foreigner is to be viewed with suspicion and distrust, that a frontier is sacred, that sovereignty is to be deified and protected with one's life.' Nationalism, Business International warns, is not merely a problem for global corporations in underdeveloped countries: '. . . the truth is that some of the most serious problems for them are created by the governments of the parent companies.'

The Problems of Irrational Nationalism

"The problems of 'irrational nationalism,' as global executives see it, include any local official, law, or tradition that inhibits the free flow of finance capital, technology, and goods on a global scale. A crucial aspect of 'irrational nationalism' is 'differences in psychological and cultural attitudes' that complicate the task of homogenizing the earth into an integrated unit. While the most obvious and expensive nationalist challenges occur when local politicians discover that they have the power to nationalize the oil within their frontiers or even to take over foreign-owned factories and mines, cultural nationalism is also a serious problem because it threatens the concept of the Global Shopping Center. "It is a sad fact of life,' Bank America's President A. W. Clausen laments, 'that there is no such thing as a uniform global market.' National, cultural, and racial differences create 'marketing problems.' Thus, he points out, Helene Curtis had to color its shampoo black to sell it in Thailand. There is no market for deodorants in some Asian countries because 'there is no problem of body odor.' Nestle has to brew over 40 varieties of instant coffee 'to satisfy different national tastes.' National linguistic peculiarities also frustrate worldwide advertising plans. General Motors' 'Body by Fisher,' *Business Week* reports, emerges as 'Corpse by Fisher' in Japanese.

Global Corporations Threaten the Existence of the Nation-State

"The reason there are 'nationalistic obstacles' in the path of the global corporation, the Chief Executives Roundtable concluded, is that 'the international corporation threatens the nation-state's very existence':

"Those who guide the nation-states are fearful that if the world economy is made more efficient and national borders are not allowed to impede the most efficient use of land, capital, labor, ideas, then the nation-state will have no reason to exist.'

"As the corporate executives themselves see it, 'the nation-state has succeeded in attracting from organized religion the basic religious impulses of man.' If the global corporation is to survive it must, in effect, establish its own religion. 'The task of international business is facing its central response to nationalism – educating people that what it is doing is in the interest of every human being, that what it is doing will eliminate hunger and increase the goods and services available to everybody. . . ."

A New Strategy for Dealing with Nationalism

"A strategy for dealing with nationalism has evolved over the last few years. In the late 1960's corporate statesmen and professors were predicting the early demise of the nation-state. More recently, however, managers of global corporations have become more cautious and more diplomatic in discussing the future of the international system. The conclusions of the Chief Executives Roundtable in Jamaica, which reflect a consensus of several dozen of America's top global corporate executives, develop this more subtle approach:

"The nationstate is not withering away. Instead it will grow in terms of its role in organizing and improving the social standing and entire environment of its people . . . By and large, multinational corporations and nation-states have many parallel interests. When tension does occur, accommodation should be accomplished on a case-by-case basis.'

The Frontal Attack on the Nation-State Has Been Replaced by a Subtler Campaign

"Thus the frontal attack on the nation-state has been replaced by a subtler campaign against borders, cultural differences, protectionism, and 'the fears of those people that attack the international corporation [which are] deeply imbedded in their psyches.' As part of the campaign, global corporate executives have vowed to take a more active political role in suggesting a constructive role for nation-states in developing the Global Shopping Center. (Global corporations, the Chief Executives concluded in Jamaica, 'should help developing countries to establish their national identity.') The global corporation must also make a 'huge' effort 'to

educate people who would prefer not to be educated and who so deeply feel that the nation-state is necessary for their happiness....' (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 57-60.)

Part VIII – The Socialist Nature of the New Imperial System

The global elite are attempting to "manage" the world as a single integrated economic unit. Since the world is composed of numerous nation-states and thus numerous economies, it is necessary for the global managers of the large corporations to attempt to remold the world to fit their preconceived "new Imperial System." Unfortunately, this system consists of leveling all national governments and transforming them into administrative units. It means converging the East with the West and the North with the South. Converging the capitalist countries with communist and lower-developed countries is not an easy assignment. That is why we are witnessing so many wars today between the forces of internationalism and nationalism.

The Evolving Vision of the Global Community

Barnet and Muller outlined the socialist nature of the "new Imperial System" which is evolving in these words:

". . . This is an age of planning, and the new globalists are the only ones with the pretension, skill, and resources to plan on a global scale. This is the age of technology, and they control most of it. This is the age of meritocracy, and the power of the World Managers comes not only from what they own but, they argue, even more from what they know. . . .

"The World Managers have an evolving vision of what constitutes the good state in the era of the Global Shopping Center. . . . The World Manager's model of the Twenty-first Century State fulfills certain specific functions: it is a protector of the free movement of capital and goods; a regulator and educator of the labor market; a balance of the private economy; a consensus builder able at least to ameliorate correctable injustices through transfer payments – i.e., social security, unemployment insurance, etc. – and a pacifier prepared to deal with the social effects of uncorrectable injustices, with force; a custodian of the national environment ready to maintain all aspects of social infrastructure essential to a good business climate. . . .

Socialism is a Big Help to World Managers

"The World Managers are prepared to do business with 'revolutionary' governments when they are firmly in the saddle. (Indeed, as one corporate strategist told us, socialism, far from being 'the end of the world,' is a 'big help' because it ensures 'stability' in large areas of the world. Planners in more than one

U.S.-based company are eyeing the docile labor force of Eastern Europe. . . ." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 65-66, 93-34.)

Earth, Inc.

It is apparent from the history of East-West trade that global planners of the giant corporations favor socialism and communism. They financed the early development of the Soviet Union and China and have supported them since their inception. The cost of insuring "stability" involves the sacrifice of millions of lives and the maintenance of a great police state where real freedom is non-existent. The above quote merely documents what corporate actions for the last ninety years attest. The large corporations are based upon central economic planning of every phase of production and marketing. Russia and China are also based upon total monopolistic practices. In one sense China and Russia are great corporations which seek to control everything and everyone, although the new republics in Russia are trying desperately to gain their freedom and independence. The World Mangers want total monopoly control of the earth, its resources, wealth and people. It is not too outlandish to call their "new Imperial System," Earth, Inc. Through the concept of interlocking directorates it is now possible to document that less than 500 hundred men have gained a controlling interest in all the major corporations of the world.

Part IX – The Convergence of East and West

Many people feel that the era of convergence theories is no longer in force. A survey of the practices of international finance and business reveal a different story. Barnet and Muller outline the convergence of East and West as follows:

"The best way to ensure that the Soviet Union and China do not disturb the vision of a Global Shopping Center is to include them in it. Some corporate executives talk of building a 'belt of capitalism' which will tie the U.S.S.R. and China into an integrated global system. They count on increasing Soviet dependence on foreign technology and spare parts to moderate any remaining revolutionary zeal. 'I think getting General Electric into China and the Soviet Union,' a GE long-range strategist told us, 'is the biggest thing we can do for world peace.' Competition among nations will be waged with economic weapons instead of missiles, U-2's and proxy wars. In short, the corporate managers hope to usher in the era of peaceful coexistence advocated so long ago by Henry Wallace and Nikita Khurshchev. . . ."

The New Map of the World

"Nixon's map of the world, which bears little resemblance to the one that John Kennedy and Lyndon Johnson once used, is quite consistent with recent corporate thinking on how to achieve world stability. The J. Edgar Hoover view of the Soviet Union has been rejected. The Kremlin is made up not of international conspirators,

but of pragmatic managers far more interested in securing their borders, developing their own consumer economy, and controlling their own population than in making revolutions in other countries. There is also a new, more relaxed view of how to handle underdeveloped societies. Guerrilla leaders are no longer seen in the simplistic terms of the Kennedy-Johnson era, when they were thought to be puppets on a long string from Moscow. (In the Truman Administration, it will be recalled, Mao was believed to be Stalin's agent.) The 2 billion people who live in Asia, Africa, and Latin America are not, Che Guevara and Lyndon Johnson notwithstanding, about to rise up and take America's wealth. They are hungry, divided, and vulnerable, and all the more so because the U.S.-Soviet detente makes it harder for small countries to play one giant off against another. Most Asian, African, and Latin American governments are in the hands of military dictatorships, rightist regimes, or technocratic modernizers, all eager for U.S. military aid, loans, and private capital, despite their growing insistence upon better terms. Many of the 'unstable,' 'romantic' revolutionary leaders who used to upset Walt Rostow so much—Sukarna, Nasser, Nkrumah — are gone, replaced by men more willing to cooperate with the corporations.

The Basic Philosophy of the Global Companies

"Ideological purity and national pride, which were at the heart of the old Cold War strategies, are now seen in corporate boardrooms as carrying too high a price tag. 'National differences should not be allowed to keep the people from doing whatever it is in their mutual interest do,' says Henry Ford II. 'This is the basic philosophy behind the multinational corporations and the world will be better when this same philosophy gains wider acceptance in other aspects of human behavior.' By mid-1973, U.S. and West European companies had entered into more than 1,200 cooperative agreements with state agencies of what in chillier days were known around Washington as 'Bloc governments.' Some take the form of 'co-production,' in which the Polish (or Hungarian or Soviet) government supplies the plant and the U.S. company supplies the equipment and know-how for the manufacture of goods destined primarily for the East European market. Singer, for example, operates a plant in Radom, Poland, to produce sewing machines under the Singer name for sale in the countries of Comecon (the Soviet version of the Common Market). The German-based global firm Siemens is producing X-ray machines in Hungary and buying telephone equipment from Bulgarian state-owned plants. East-West co-operative agreements take a wide variety of forms such as licensing, joint R&D programs, etc., all designed to accommodate the socialist doctrine of state ownership and the capitalist doctrine of private enrichment. Once it became obvious to top corporate managers that nothing short of a suicidal war would dislodge the Communist rulers in Moscow and Peking, it followed that peace-mongering was good business.

A New Role for the U.S. Military

"But the most avid advocates of East-West trade are quite aware of the distinction between peacemongering and pacifism. They believe that U.S. military power still has a crucial role to play in promoting world stability, but they believe that this power must be exercised differently – more subtly and less expensively. As in a well-run town where the police are always there but not too much in evidence, the Global Shopping Center is kept at peace by a powerful, unobtrusive, and where possible, multinational constabulary. Since Asian soldiers, according to Pentagon statistics, cost only one-fifteenth of what is spent on their American counterparts, and neither they nor their parents vote in U.S. elections, the use of 'indigenous troops' around the world to keep order makes both fiscal and political sense. The Nixon Administration budget reflects this understanding. Vietnamization is now a worldwide policy. Local troops are hired with American tax dollars to carry out the police function once performed by U.S. soldiers." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 96-99.)

The U.S. Military Paves the Way for Global Companies

The above quote demonstrates how effectively the global corporations dominate and use such governments as the executive branch of the United States Government. The state, treasury and defense departments, as well as the CIA and the National Security Council, are instruments of the global planners to further their long range plans on the earth and to maintain or protect the international systems they have created. Barnet and Muller outlined this strategy as follows:

"The readier the Pentagon and CIA were to bring down or raise up governments in underdeveloped countries, the better the investment climate for U.S. corporations. U.S. military power was used to establish the ground rules within which American business could operate. The U.S. Government acted as consultant for rightist coups in Bolivia, Brazil, Chile, Greece, and Indonesia, and their generals opened their countries to U.S. investment on the most favorable terms. Whenever the flag has been planted around the world, in some 500 major military and naval bases and in the command posts of over a dozen military interventions, U.S. corporations have moved in. The construction of a worldwide military empire has been good business. Subsidized by public funds, U.S. companies have built roads, harbors, airports, hotels, and banks around the globe. The military budget is perhaps the best example of the compatibility of patriotism and profits. During the cold War the Department of Defense has had \$40 billion to \$50 billion a year to distribute to U.S. corporations through procurement contracts. With \$6 billion a year to spend on research, much of which went to finance development costs of civilian products like the Boeing 707, the Pentagon has been a major subsidizer of some of the largest U.S. corporations. When electronics and aircraft companies used to take full-page advertisements in newspapers and magazines to warn of the Soviet menace, they were, as they saw it, responding to a patriotic duty and a

business opportunity simultaneously. . . . (Richard J. Barnet & Ronald E. Muller, *Global Reach*, p. 79.)

A Series of Reformations Pave the Way for a Global Economy

The World Managers have a set of long-range goals in mind for the earth that startle the average citizen in the world. Barnet and Muller outlined a number of the ideological and institutional reforms sought by the elite leaders of the giant corporations as follows:

". . . The World Managers have larger, but vaguer, visions of the kind of world they would like to see. Much of what they call their 'educational effort' is devoted to these visions. Calling themselves radicals, they see the need for a series of reformations to make possible the peaceful transition to a global economy: a reformation in public attitudes, a reformation in national structures, and a reformation of the ground rules under which global business is conducted.

A Public Relations Campaign to Promote the Global Corporations

"We have already talked about the kind of public attitudes the global corporations would like to encourage – more corporate loyalty, more product loyalty, and less national loyalty. In short, they want to build a faith that the corporation is the principal engine of progress and peace. It is standard rhetoric that the existing political structures are obsolete, but the alternative political vision is rather murky. Like most reformers, they know better what they are against than what they are for. Nonetheless, by reading enough speeches, testimony, and interviews it is possible to catch a fleeting glimpses of the new America that the World Managers would like to see.

Corporate Socialism – A New Partnership Between Business and Government

"When the United States is fully integrated into the Global Shopping Center, the Federal Government will limit its interventions into society to those tasks which are beyond the capacity of businessmen. Confident that the automatic processes of the market, provided these are regularly oiled with the latest managerial techniques, can solve most of the problems of the poor countries as well as the rich ones, the World managers nevertheless see an expanding role for government. James P. McFarland, chairman of General Mills, talking about 'The Corporation in 1990' at a White House Conference in 1972, echoed an increasingly familiar theme among businessmen: a call for 'a genuine government – business partnership.' In 1990, 'government and business and labor – and in fact all elements of society – should be sitting down to plan the future, to establish national priorities and to agree upon objectives and strategy.' The managerial task, says McFarland, is 'the development of a national climate that will allow the orderly transition to a corporate structure able to meet tomorrow's challenge.'

The Government No Longer plays Its Role under the Constitution

"Since the corporation is the primary engine of development, the primary function of government is to enable the corporation to fulfill its promise. In the corporate vision of 1990, government no longer plays its traditional role under the Constitution. It is no longer the expression of national consensus – which, indeed, is worked out by means of a government – corporation-labor partnership.

The New Role of Government

"The real job of government is to perform certain services essential to the development of a good business climate. Most important is the management of the economy. It is the function of government to stabilize the economy – to stimulate or to cool the economy as needed whenever the natural regulating mechanisms of the market fail to work (which seems to be much of the time). The Federal Government, always in partnership with business, should control interest rates and other credit policy. When necessary, it should impose price controls and wage controls. All of us 'will be asked to give up some of the prerogatives we have taken for granted,' says McFarland. Government will continue to act as a pump primer of capital into the economy, through either the military budget or social programs. (At present the Department of Defense finances over one-half of all research-and-development costs in the U.S., including 90 percent of that done in the aviation and space industries.)

Developing the Needed Infrastructure for a Global Economy

"The second essential service is to develop the needed infrastructure for a global economy. In addition to the usual infrastructure expenses such as highways, harbors, communications networks, and shipping are environmental expenses. A constant theme in World Mangers' speeches is that the government should pick up the cost not only of decontaminating the nation's already polluted air, rivers, and lakes but also of converting the industrial process so that the rate of new pollution will be slowed. Similarly, the cost of safety measures for consumers and workers should be subsidized with public money.

Smoothing the Transformations of the U.S. Economy

"Government has a third function to play in smoothing the extraordinary transformation that global corporations are bringing about in the U.S. economy. Since economic logic argues for the relocation of U.S. production overseas, it is the task of government to subsidize, retrain, or move workers who are displaced in the process. Similarly, government should not try to protect inefficient noncompetitive industries such as shoes or textiles which cannot survive in a world without borders, but should rather assist them to become more competitive, or help reallocate their resources into new industries.

Bringing About a World Without Borders

"The nation-state has a crucial role in bringing about the world without borders. Only governments can abolish restrictions on the movement of goods and capital and make use of economic weapons such as quotas, tariffs, and taxes to ensure favorable treatment of U.S.-based global corporations in other countries.

A Stronger Executive and a Weaker Congress

"Thus it is the increasingly complex task of government to pursue an aggressive (and often contradictory) foreign economic policy making use of both liberalization and protectionism. Only a centralized government in which the president enjoys great discretion to employ one or the other policy can play such a delicate balancing role. Thus an important part of the new managerial vision of the new America is a stronger centralized Executive and a relatively weaker Congress.

Government is to Promote Institutional Change

"Finally, the task of government is to be an educator and promoter of values and certain forms of institutional change. McFarland foresees a 'dramatically different' employer-employee relationship in 1990: more social pressure on corporations to expand services and benefits to employees along the paternalistic model of Japanese industry – day-care centers, corporate sabbaticals, etc. But all this must take place within the context of the private-profit system. Government must expand its priestly function as guardian of the ideology of the private-enterprise system. 'The kind of structure we will have in 1990,' McFarland concludes, 'depends in good measure upon our ability between now and then to redefine capitalism in a manner which is understood and believed. . . .' (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 110-113.)

Part X – The Development of Global Cities

The above remarks and quotes demonstrate that a new corporate structure for managing the earth has been slowly evolving for decades. Hundreds of millions of dollars have been spent by the giant corporations to remold public attitudes toward acceptance of "central economic planning, socialism, corporate socialism, finance capitalism, monopoly capitalism and international institutions based upon civil law principles." One transformation which is occurring is the development of the concept of global cities. Barnet and Muller note:

"A clearer picture of the sort of political reformation global corporations have in mind can be gleaned from a recent piece of contract futurology on making Paris a 'global city,' prepared for a French Government planning agency by Howard V. Perlmutter and Hasan Ozbekhan of the Wharton School of Finance Worldwide Institutions Program. Professor Perlmutter, a consultant to a number of global corporations, was presumably being paid for his knowledge of the needs and

preferences of the global corporations. Thus while his 'Scenario A,' which describes the 'necessary infrastructures if Paris is to fulfill its vocation as a World Center,' undoubtedly represents more advanced thinking than is typically done in corporate boardrooms, it is indicative of a direction which many executives themselves find congenial. He begins by pointing out that '. . . those cities that understand what infrastructures are needed . . . as the Global Industrial System (GIS) evolves . . . will become the "global cities" of the 1980's.' To become a global city, Paris must undergo a process of 'denationalization' and 'become less French.' This requires a 'psycho-cultural (or attitudinal) change of image . . . with respect to the traditional impression of "xenophobia" that the French seem to exude.' As this cannot be done directly, it is felt that it might be achieved by greater exposure of the population to other cultures, other languages, other ways of doing things and ways of being right. Perlmutter, a professor of social architecture, advocates 'the globalization of cultural events,' such as supranational rock festivals, as an antidote to 'overly national and sometimes nationalistic' culture.

A Change in the French Capital

"The most radical recommendation is that Paris cease to be the capital of France. Continuing its present role would make the city too 'ethnocentric' to be a Global City. Orleans is to be the new 'administrative capital of the French space.' The 'highest levels of the French government remain in Paris' (i.e., external and fiscal functions), but the administrative structure is moved elsewhere. Thus 'the structure, outlook, and influence of the French government is *global* rather than purely French' and involves responsibilities which clearly transcend the traditional French space.'

Life in a Global City

"In the Global City no one is a foreigner. Non-French executives of global corporations living in Paris should be able to vote for a Council of Paris and even be elected to membership. The Global City would, of course, have all the necessary infrastructure – deluxe hotels, conference centers, a telecommunications network much better than Paris' present notorious telephone system, a University of the World, and a financial center.' The reformed Paris would feature two types of living arrangements for global executives. One would be located in the heart of the city to cater to those executives 'concerned with culture, entertainment, urban vitality,' while the other would be for the more 'family-oriented.' It would be in a country setting featuring good air, trees, silence, good schools, and 'stress-reducing facilities for cultural-shock cases.' Paris, the authors conclude, can become a 'vital locus of planetized consciousness. . . ." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 113-114.)

Part XI – Molding the World Educational System

A key ingredient for construction of a "new Imperial System" on the earth is control of the educational system and intellectual world. Of course, the giant tax-exempt foundations such as Ford, Carnegie, and Rockefeller, have been in the forefront of controlling and reprogramming the educational system of not only the United States but the entire world. Barnett and Muller explain:

"A prime target in the campaign to reform political institutions is the university. In the United States, under the stimulus of the Vietnam War some campuses became centers of radical questioning of some of the basic assumptions of America's business-oriented culture. Here too were centers of anticorporate demonstrations and propaganda, dramatic testimony in the era of growing government-business partnership that the university is the last remaining respectable institution with a degree of independence. Indeed, the original campus revolt of the 1960's, the Berkeley Free Speech Movement, was in important measure a reaction to Clark Kerr's vision of the 'multiversity,' which the students saw as a servant university for a totally integrated corporate society. It is precisely this tradition of independence in the academy that now worries some executives, for they see the university as the institution spawning, protecting, and advancing the countercorporate culture....

Universities are Dependent upon Private Capital

"As Thorstein Veblen demonstrated many years ago, universities that depend upon private capital for their survival are dependent upon capitalists. True, there are examples of a few conservative philanthropists showering money on academic centers that employ radicals and critics. Some businessmen have deeply believed the American ideology of free speech and free inquiry. But in moments of crisis, business liberalism tends to become shaky. During the 'Red scare' of the 1920's and the Cold War of the 1950's, moneygivers, business alumni, and trustees, as might be expected, exerted their influence in such a way as to make the university conform to the prevailing mood and mores of the country.

A Threat to Global Vision of the World Managers

"The worldwide student revolution that reached its peak in 1968 was spontaneous, unrelated, but remarkably similar protests in the United States, France, Germany, and Mexico was a source of great anxiety for the World Managers. Since the crucial factors in the success of the Global Factory and the Global Shopping Center are technology and managerial skill, and universities are the traditional suppliers of both, the politicization of the university is a potentially serious threat to their global vision.

"In some underdeveloped countries, particularly in parts of Latin America, the university has been the center of the two ideologies that most complicate the life of

global corporations there: nationalism and socialism. Universities have a certain tradition of independence from and antagonism to the local government, and vocal expressions of hostility to all forms of 'yanqui imperialism' are standard. In Mexico, for example, foreign companies are worried that university disorders, which represent virtually the only organized political dissent in the country, might spark a wider revolutionary response. (The government, it is generally believed, blocked the extension of Mexico City's superb subway to the university for fear that the students would attempt to paralyze the system.)

Attacking Politicized University and Unpalatable Professors

"Thus foreign companies are openly counterattacking against politicized universities and politically unpalatable professors. In February 1970, for example, the new British university at Warwick, whose vice-chancellor, J. B. Butterworth, boasted 'that he would create a university tailored to the needs of an industrial society,' received a confidential report from the director of legal affairs of the Rootes Organization, Chrysler's British subsidiary, on the political activities of a visiting American professor named Montgomery. In Mexico the rector of the University of Queretaro, Hugo Gutierrez, was summarily dismissed in 1965 two months after an exchange with the local manager of Coca-Cola and head of the chamber of commerce, who wanted a certain professor dispatched on a prolonged research trip because he had 'funny ideas.' The rector, an ex-actor, replied that he was concerned about the 'funny ideas' of the Coca-Cola public relations department, but no one saw the humor, and the governor of the state fired him. (The rector had also encouraged a university study entitled 'Who Owns Queretaro?' which did nothing to enhance his popularity with local politicians, U.S. corporations, or the Catholic Church.)

The University Will Have to Come to Terms With the Conflict Between Democratic Principles and Effective Government

"But most corporate influence on universities is exerted in more civilized ways. Hugh Stephenson of the London *Times* has given an interesting description of the University of Warwick, which has a Barclay's Bank Chair of Management Information Systems, a Volkswagen Chair of German, and a British Leyland Motors – endowed Chair of Industrial Relations. The university has done research on metal fatigue of direct interest to Massey-Ferguson, on tire fatigue of interest to Dunlop, and on vehicle instrumentation of interest to Chrysler. (The chief executive of British Chrysler is on the university's governing board.) The University Council in 1968 hired a firm of industrial consultants to make the university more efficient. (One of the recommendations was that since university democracy was 'an amorphous and time-wasting system' the university would have to 'come to terms with the age-old conflict between democratic principles and effective government....')

Developing Nonideological and Technically Oriented Centers of Learning

"Admittedly, the University of Warwick is not a typical university. But in many countries where they have operations the World Managers are seeking to exert influence on more traditional centers of learning. In Queretaro University, for example, according to Hugo Gutierrez, Purina, Singer, Kellogg, Carnation and other companies each contributed less than \$5,000 a year in the mid-1960's, for which they had a crucial voice in university policy. Elsewhere in Mexico, private universities, such as the University of the Americas and Anahuac University, have received important gifts from U.S. companies. Chase Manhattan donated to the Anahuac Law School. Eastman Kodak has given a laboratory to the same institution. The advantages to the global corporations are rather clear. Not only do they buy a certain amount of local goodwill and show 'social responsibility,' but they also help ensure the development of nonideological, technically oriented centers of learning where research of interest to the companies can be done and an apolitical, value-free, nonactivist, achievement-oriented study body can be trained.

The Model for a New University

"The model for such universities is now being developed by a variety of corporate planners and consultants. Howard Perlmutter, for example, is designing a University of the World, which, he says, is an 'essential' component of the Global Shopping Center. It would develop a global outlook and would provide a uniform worldwide curriculum for the children of the World Managers. (This sort of service appears essential for the growing army of footloose executives. The manager of Nestle's U.S. operations, a Swiss citizen, recently returned to Switzerland to take over as a world director of the company only to discover that his son could not get into a Swiss university because none would give him credit for his work in a New York high school.) In Professor Perlmutter's scenario on how to make the French capital a 'global city,' he proposes establishing there 'a truly nonrational learning center . . . whose main purpose would be research, learning and teaching in how to develop global resources – industrial, commercial, agricultural, social, and cultural.'

The New University of the World

"The University of the World is to be supranational, technical, and practical. 'The U of W becomes an active partner in, and an innovative contributor to, the work of the "real" world,' Professors Perlmutter and Ozbekhan advise their Parisian clients. Students, for example, will have 'on the job' training in such important academic pursuits as police work. The following is a complete list of proposed departments for the University of the World:

HEALTH ENVIRONMENTAL ECONOMICS
POPULATION CONTROL WASTE DISPOSAL

EDUCATION COMMERCE-INDUSTRY
CRIMINOLOGY AGRICULTURE
LAW ENFORCEMENT MINING
FIRE PROTECTION LOCAL AND STATE GOVERNMENT
ECOLOGY ADMINISTRATION

A New World Curriculum to be Disseminated in Every Country

"The political implications of a world curriculum that could be disseminated by television in every country are obvious. The power, authority, and prestige of national universities would be undercut. Who would not rather stay at home by the TV and get an MIT diploma, an elite passport to the outside world, than study his own national traditions and local problems at, say, the University of Nairobi? The global-university curriculum would be geared to the needs of the 'real world' – i.e., the emerging Global Shopping Center. Criticism of the underlying values and assumptions of the society would be muted. Doubt, searching for alternative visions, and other inefficient intellectual activities would be discouraged. (Perlmutter and Ozbekhan see the 'ideological turmoil' of the present Paris educational system as creating 'a real diffusion as to the intellectual direction of instruction.

A Worldwide Educational Reformation to Justify the New Global Community

"A long-range strategist for a major U.S.-based electronics company is advising the Brazilian Minister of Education on how to make the University of Sao Paulo 'less liberal in an emotional sense' and 'more responsive to the needs of industry.....' In short, the worldwide educational reformation envisaged by the World Managers is designed to integrate and rationalize the global production of commercially useful knowledge." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 114-118.)

Part XII – Creating a Global System of Governance

The "new Imperial System" under construction today has been in the planning and development stage for many decades. Barnet and Muller outline that the global managers want a world political and economic organization to supersede governance by the nation-states:

"The heart of the legitimacy problem for the global corporation is the class between global corporate loyalty and national law.

"Wherever global corporations encounter image crises, some local law or custom has usually been violated, at least in spirit, whether it be tax laws,

currency-control laws, or some important tradition: e.g., the State Department, not ITT, is supposed to set foreign policy. It is evident that governments are losing control over important international transactions and that nominally private organizations are gaining control over such transactions. The ancient political question *By What Right?* keeps plaguing the global corporations as they become more assertive in acting like states. Their justification for their power, as we have seen, is efficiency; 'We can deliver' is their political slogan.

International Chartering of Global Corporations

"But the World Managers know that neither slogans nor 'educational campaigns' are enough to legitimize the exercise of political power. Authority must be sanctified by law. Thus men like George Ball have been talking for many years about international chartering of global corporations by some world organization. (While some World Managers have speculated about the United Nations' playing such a role, and the thought of being regulated by an U Thant or some other mild international civil servant with a modest budget has certain attractions, most global corporations are not enthusiastic about the United Nations as the source of international corporate authority because of the large representation of underdeveloped countries which are 'lacking in business experience.' They would rather have organizations dominated by industrial countries, such as the Organization for Economic Cooperation and development, do the regulating.)

A Global Governmental Counterpart to the Global Company

"Jacques Maisonrouge wants an international governmental counterpart to the global corporation, a tripartite entity made up of labor, government, and company representation, which would set the new ground rules under which the companies would operate. The International Chamber of commerce has proposed the adoption of international guidelines for regulation of the behavior of corporations and governments, and the Atlantic Institute, among others, sees a possible solution to the legitimacy problem in a 'code of good behavior' to which all World managers would faithfully subscribe.

A Reformation of the Global Corporation

"David Rockefeller believes that the reformation must include the global corporations themselves. Stock ownership must become more truly multinational. Profit-sharing schemes and other incentives to give a 'stake' in global enterprises to foreign workers should be expanded. Corporate executives should do more self-examination to determine whether they are really being as 'socially responsible' as they should be. Corporations should take steps to 'remove the air of mystery which sometimes surrounds them,' advises the Atlantic Institute. Other executives have put it more bluntly. Corporations have a reputation for secretiveness which does nothing to build public confidence. (The reputation is understandable, since corporations spend millions of dollars in legal fees each year to keep what they

regard as their business – i.e., how much money they are really making – from the prying eyes of labor unions, consumer groups, minority shareholders, and the Internal Revenue Service.)

The World Mangers Are Orchestrating a Great Crusade

"The World Mangers who are orchestrating the Great Crusade bear little resemblance in style to the entrepreneur of fifty years ago. Gone is the 'Public Be Damned' arrogance of the Vanderbilts and the other robber barons. In its place is a liberal vision of a world corporate society promising peace and abundance. Behind the advertising and public relations campaigns is genuine ideological fervor – and creeping doubts. The World Managers, at least the ones with whom we have talked, believe that they have as good an answer to the problems of mankind as anyone. At the same time, they sense that convincing the world of this is a staggering task. Yet every failure of government, from torture in Brazil to Soviet anti-Semitism to the Watergate scandal, strengthens their conviction that they have a historic mandate to create a postpolitical world order." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 118-120.)

Part XIII – The Transformation of America

The global corporations have transformed America from a debt-free, prosperous, hard-working nation with a system of limited government into a debt-ridden, secular society with a centralized government. Political power is now in the hands of professional politicians who are beholden to the elite financial oligarchy controlling America. Barnet and Muller outlined the transformation wrought by the giant corporations and its impact on America as follows:

"At a particularly tense moment in the Watergate crisis, the veteran White House correspondent of *Time* magazine archly referred to the United States as a banana republic. Indeed, the constitutional crises provoked when the President is investigated to determine whether he is committing high crimes in office or the Vice-President is forced to resign for pettier crimes committed in a lesser office are more reminiscent of Latin America than what has generally been thought to be the world's most stable political system. Such parallels can be overdone. They hysterical political metaphor is not a substitute for analysis. The United States is not 'becoming' another Brazil any more than it is 'becoming' another Nazi Germany or Soviet Union, despite dire predictions from the left and the right. Nevertheless, it is now possible to discern certain structural changes in the United States which are causing the world's richest nation to take on some of the aspects of an underdeveloped country. Some of these changes are directly related to the rise of the global corporation.

The Impact of the Global Corporation on America

"To understand the impact of the global corporation on the majority of the people of the United States ... we need to recall the principal elements of the global transformation we have been describing thus far. In the first place, the rise of the global corporation represents the globalization of oligopoly capitalism. In perhaps simpler terms, the new corporate structure is the culmination of a process of concentration and internationalization that has put the world economy under the substantial control of a few hundred business enterprises which do not compete with one another according to the traditional rules of the classic market.

Global Profit Maximization

"Second, the interest of these enterprises is global profit maximization, which may, as we have seen in our study of underdeveloped countries, require profit minimization in certain countries under certain circumstances. This is but one example of how the interests of global corporations and countries in which they conduct their operations may conflict. As we shall see in the chapters that follow, conflicts also exist between U.S.-based global corporations and their home country.

The Third World Countries Are the New Sites of Production

"Third, the poor nations of Asia, Latin America, and, soon, Africa, long the hewers of wood and drawers of water for the international economy, are increasingly becoming the principal sites of new production. This dramatic shift from north to south, which could not have been predicted even ten years ago, is changing employment patterns and living standards in the United States.

A Concentration of Power in Private Hands

"Finally, this global economic process is producing a new concentration of political power in what are, in legal and political terms, private hands. In short, the managers of the global corporations are neither elected by the people nor subject to popular scrutiny or even popular pressure, despite the fact that in the course of their daily business they make decisions with more impact on the lives of ordinary people than most generals and politicians. The principal source of their power is their control of knowledge of three specific kinds: the technology of production and organization – i.e., how to make, package, and transport; the technology of obtaining and managing finance capital – i.e., how to create their own private global economy insulated from the vicissitudes of national economies by means of shifting profits and avoiding taxes; the technology of marketing – i.e., how to create and satisfy a demand for their goods by diffusing a consumption ideology through the control of advertising, mass media, and popular culture." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 213-214.)

Part XIV – The Power of the Global Banks

Economic decision-making which affects the well being of the citizens of the world is not being made in the market place by the consumer but by a few hundred individuals who sit on the boards of the large global corporations. A few international banks have come to dominate not only the money industry in the United States and the world-at-large, but also other key sectors of the economy. Banks now are exercising major control over the nation's manufacturing, media, transportation industries, public utilities, mining companies, computer industry, etc. Barnett and Muller pointed out the power and influence of the large international banks as follows:

"Banks have certain advantages over other corporations in their ability to use cross-subsidization. The most mobile of business enterprises, they can change the focus of their activities from country to country as financial conditions change. Thus the top U.S. banks which invaded London during the Eurodollar boom of the 1960's are now retrenching somewhat in the City and expanding their activities elsewhere. Similarly, they are more flexible in dealing with regimes of all political hues. As the world economy becomes more integrated, even the most militant Communists, who also need hard currency, cannot afford to offend the international bankers.

Banks Expand Control of Nonbanking Sectors of U.S. Economy

"The process by which banks have expanded their control of the nonbanking sectors of the U.S. economy has involved three major strategies. The first is the use of their enormous holdings of industrial stocks which they either own or manage for customers in trust accounts. In 1971 banks owned \$577 billion in corporate securities in their own portfolios and had control of an additional \$336 billion in trust funds. Together these assets in the hands of banks amount to almost \$1 trillion. Trust funds are portfolios of securities given to banks to manage, usually for widows, children, estates, pension funds, or charitable institutions. In 1971, in addition to the banks' own holdings, bank trust departments held 22 percent of all the outstanding voting shares of all publicly held U.S. corporations. For more than 80 percent of these shares the bank had "sole investment responsibility" – which meant that it could buy and sell the shares at will and vote the stock at shareholder meetings.

Enormous Power for Good or Evil

"Thanks to the continuing investigative work of Congressman Wright Patman's Subcommittee on Banking and Currency and Senator Lee Metcalf's Subcommittee on Budgeting, Management and Expenditures, we know a good deal about how banks have translated that trillion dollars into what one subcommittee calls 'enormous potential power for good or evil.' Economists generally agree, and managements are acutely aware, that a shareholder in control of 5 percent of a

publicly held corporation cannot be safely ignored. According to the Patman Subcommittee, there is 'considerable evidence' that corporations seek to establish 'close contact' with such shareholders, who are almost invariably large institutional investors. Corporate management regularly consults them on 'any major corporation decision, such as a proposed merger, a new stock issue proposal or any pending decision which may seriously affect the company's operations.'

Corporate Managers Listen to the Bankers

"Corporate managers listen to the bankers' answers, since they have the power to sell off large blocks of stock and cause a decline in its value, thereby hurting the reputation of management and, perhaps more importantly, the value of its stock options. Moreover, when a bank or insurance company controls 5 percent of a company's stock, it can exert crucial voting power in the event of a proxy battle. (It is much easier to enlist the support of a 5-percent shareholder than to recruit 5,000 small investors.) Institutional investors dominate annual shareholders' meetings on the relatively rare occasions when fundamental issues of corporate policy are put up for a vote.

The Power of America's Largest Global Banks

"The top 49 banks have a 5-percent or greater share of 147 of the top 500 industrials. They have a 5-percent or greater interest in 17 of the top 50 transportation companies, 29 of the top 50 life insurance companies and 5 of the top public utilities. Some specific examples provide a more vivid picture of the power of America's largest global banks.

Fifteen Major Financial Groups in the U.S.

"By examining interlocking directorates and stock ownership of the leading U.S. banks, the economist Peter Dooley has identified fifteen major financial groups in the United States. A group is a collection of nominally separate corporations which pool their resources to enhance their combined power. By far the most powerful is the Rockefeller-Morgan group, the coordinated financial operations of the descendants, beneficiaries, and employees of John D. Rockefeller and J. P. Morgan. As early as 1904, John Moody, the founder of *Moody's Industrials*, still the leading directory to the labyrinth of high finance, concluded that it was impossible to talk of the Rockefellers and Morgans as separate economic actors, so intertwined were their various activities.

The Power Base of the Rockefeller-Morgan Group

"Taking another look at the Rockefeller-Morgan empire in the mid-1960's, Peter Dooley concludes that 'it is not possible to separate these groups.' The power base of the Rockefeller-Morgan group is the control of six of the country's largest banks: the Chase Manhattan Bank, the Rockefeller family depository, of which

David Rockefeller is chairman; the First National City Bank; Manufacturers Hanover Trust; the Chemical Bank of New York; the Morgan Guaranty Trust; and Bankers Trust. In the mid-1960's, according to Patman Subcommittee research, these banks dramatically increased their holdings of one another's stock and consolidated the interlocks among their boards. Together four large interlocking New York banks, according to a 1973 Senate Government Operations Committee report, hold 21.9 percent of United Airlines, 24.7 percent of American Airlines, and 13.8 percent of Western Airlines. The Chase Manhattan Bank alone holds substantially more than 5 percent of United, American, Northwestern, and Western. Chase (with two other Rockefeller-Morgan banks) has voting rights to 23.1 percent of the stock of CBS, to 24.6 percent of ABC, and to 6.7 percent of NBC. In addition to the principal airlines and the three major networks, the Rockefeller-Morgan group has effective control of key sectors of the mining industry. (It is scarcely necessary to mention the Exxon Corporation, until recently Standard Oil, the largest energy corporation in the world and the source and constant nourisher of the Rockefeller family fortune.) In 1967, Chase had a 5.5-percent interest in Reynolds, and Morgan had a 17.5-percent interest in Kennecott (which in turn owns Peabody Coal, the world's largest coal company) and a 15.5-percent interest in American Smelting and Refining.

The Power of the Large Banks

"No committee of Congress or anyone else has been able to show exactly how large banks use their power in the communications and transportation industries and how their huge holdings may affect the public interest. We have some ideas on this, which we shall take up in the next section. Whether banks have too much power over other parts of the economy is controversial. Whether Congress should have the information to determine whether this is so is not. Public authorities do not have the regular access to the information on the interaction of crucial institutions necessary to understand the present U.S. economy and how it works.

Banks Concentrate Ownership and Control through Interlocking Directorates

"Banks have reinforced their concentration of ownership and control by means of a second strategy, the liberal use of the interlocking directorate. The Patman Subcommittee found that the top 49 commercial banks had 5 percent or more stock control *plus* interlocking directorates with 5,270 companies. Dooley's 1966 study 'The Interlocking Directorate' in the *American Economic Review* concludes that 'most of the larger corporations have been interlocked with other large corporations for many decades.'

The Interlocking Directorate

"What are interlocking directorates and why are they important? An interlock occurs when a corporation elects an executive or director of another corporation to be on its board of directors. There are many possible motives behind the practice.

Sometimes it is to get expert business advice from a proved success in another field; sometimes to embellish an annual report with an eminent name. Still another possibility is to suppress competition by inviting representatives of competing firms to share in coordinated planning for the industry. (This practice is prohibited by the Clayton Act of 1914, but Dooley's study shows that 'nearly one in every eight interlocks involves companies which are competitors.') There are special reasons why corporations like to invite bankers to sit on their boards and why bankers like to accept. 'By electing a banker to the board of directors,' Dooley notes, 'a company may expect to have more ready access to bank funds while the banker can watch over the operation of the company and reduce the risk of lending to a distressed borrower.' On the other hand, banks like to elect company officers to their boards to 'attract large deposits' and 'reliable customers' for large loans. Adolph Berle, perhaps the most influential analysts of the American corporation, describes how interlocking directorates enhance the power of banks:

"As trustees, these banks are large stockholders. As suppliers of credit, they have the influence of lenders. With interlocking directorates, they potentially can influence the decision-making function of the operating corporate managers.'

The Root of Many Evils

"In 1914, Louis Brandeis branded the practice of interlocking directorates 'the root of many evils' because of the 'fundamental law that no man can serve two masters.' In the early years of the century populist sentiment was running high, and even Woodrow Wilson was condemning the bankers for their 'monopoly' of money. Running for office against banks in Texas a generation ago was the equivalent of running against King George in the Irish wards of Chicago. Today most populist attacks against bigness, banks, and interlocking directorates have a faintly quixotic air since the U.S. economy has been hurtling for so many years in the opposite direction.

The Use of Cross-Subsidization

"The third and most important strategy of banks for extending their influence over the nonbanking sectors of the economy has been the use of cross-subsidization. Just as oil companies could use their economic power to enter the coal business or the nuclear-energy field or a newspaper chain could use its oligopoly profits to buy TV stations, so the largest banks have in the last ten years systematically used their power over the banking sector to enter, and eventually to dominate, unrelated fields such as insurance and equipment leasing. It had been an article of faith in the New Deal days that the speculation of banks in the stock market was a prime cause of the Great Crash. Accordingly, until the mid-1960's banks were effectively prohibited by law not only from dabbling in the stock market but from venturing into virtually all other new financial pastures.

Essentially, they were supposed to confine their business to gathering in deposits and lending out money.

The Bank Holding Act of 1956

"The Bank Holding Act of 1956 was designed to reaffirm control of banks, but it contained a rather obvious loophole that permitted nonbanking corporations to own both banks and nonrelated industries. Though ostensibly intended for the small-town rural banker who might want to own the local hardware store along with the family bank, the one-bank holding company has been used to establish the banking conglomerate in which a single corporation controls travel services, insurance, commercial paper, consumer credit, credit cards, leasing of industrial equipment, data processing, and certain types of mutual funds. No single lawyer's invention has contributed more to the concentration of wealth in America; banks can use cross-subsidization to drive independent entrepreneurs out of all these businesses.

Intense Global Oligopolistic Competition Forced Further Concentration

"The First National City Bank, which took the lead in creating a one-bank holding company, Citicorp, and the other banking giants that followed expanded their activities in this direction – not only because of their own passion for growth but also because their foreign competitors were thinking and acting the same way. In the mid-60's similar developments in the banking industry were taking place in France, Britain, and Germany, where legislation was already more permissive than the United States. Thus, as in the industrial field, the intensification of worldwide oligopolistic competition forced further concentration in the U.S. economy.

The One-Bank Holding Company

"The one-bank holding company permits banks to transcend legal and financial restrictions that pertain to banks and to cross geographical borders otherwise barred to them. The size of the banking giants permits them to achieve certain economies of scale which in effect pay for their expansion. Thus, for example, banks went into the data-processing business with virtually no initial investment because they had unused time in their own computers. In 1969 new legislation was passed – supposedly to close the loopholes that had permitted banks to escape much intended regulation; but as it finally emerged from the Congress, the new law almost perfectly suited the interests of the large commercial banks. While it helped to prevent the takeover of banks by nonbanking conglomerates, it ratified the right of banks to expand into other 'closely related' financial activities. Thus, Americans hold over 56 million BankAmericards, owned by Bank of America, or Master Charge cards, owned by Inter-Bank, a consortium of the Rockefeller-Morgan – controlled New York banks. For the banks the card is a way of selling 18-percent loans without taking up a bank officer's time. Leasing arrangements are now responsible for what is probably the most rapid and significant growth in the

power of banks over nonbanking activities. Banks are consolidating their hold over the aviation industry by financing both the seller and the buyer of the same equipment, the aircraft manufacturers and the airlines. Between 1971 and 1974 about \$15 billion in sales have been financed through such arrangements. The leasing of equipment is thus one more device for accelerating the diversified growth of banks. 'Tomorrow Citicorp will be bigger and in more places,' the company promises." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 233-239.)

Part XV – Bankers' Socialism

The large global banks in New York, such as Morgan Guaranty, Chase Manhattan, Citicorp, and others, daily make decisions which affect the lives of every citizen in the United States. Barnet and Muller note that bankers' socialism has taken over America:

". . . Indeed, the proper role of bankers in our society has been a matter of controversy even before Andrew Jackson's clash with Nicholas Biddle over the chartering of the National Bank shook the foundations of the young republic. Despite the advertising campaign to convince anyone with a steady income that 'you have a friend at Chase,' most people do not think so. The popular image of the banker – a rather stuffy man who arrives at the office late and from time to time forecloses on mortgages – was established in turn-of-the-century melodramas and, despite millions spent in institutional advertising, is not yet wholly refurbished. Commercial banks, Wright Patman notes, have 'crept into every crevice of the American economy,' are in a position to make too many crucial decisions affecting the rest of us. Some Marxist critics are strongly impelled to show that banks dominate the industrial economy because this thesis represents the fulfillment of Hilferding's and Lenin's prophecies about the evolution of capitalism. The conflict of interest between industrialists and bankers is seen as part of a 'fatal contradiction' which will lead to the collapse of capitalism.

Promoting Concentration in Nonfinancial Industries

"Our view is different. Banks play two different roles – one in the regulated and another in the nonregulated sector of the economy – with different public consequences. In the nonregulated, dynamic sectors such as the drug, computer, and communications' industries and the fast-growing industrial conglomerates like ITT and Gulf & Western, banks played a crucial role in supporting company management by facilitating its acquisition campaign. This is Wright Patman's summary of what happened:

"One of the favorite pastimes of concentrated financial power is promoting concentration in nonfinancial industries. There is substantial evidence that the major commercial banks have been actively fueling the corporate merger movement. A 1971 congressional report, for example, found that major banks

financed acquisitions, furnished key financial personnel to conglomerates, and were even willing to clean out stock from their trust departments to aid in takeover bids. Thus Gulf and Western, one of the most aggressive conglomerates of the 1950's and 1960's (92 acquisitions involving almost a billion dollars in eleven years), expanded hand in glove with Chase Manhattan. Friendly representatives of Chase made funds available and provided advice and services that assisted Gulf and Western in its acquisitions. In return, in addition to the customary business charges for Gulf and Western's accounts and loans, Chase secured banking business generated by the newly developing conglomerate that formerly had gone to other banks, and was recipient of advance inside information on proposed future acquisition.'

The Increase in the Power of Banks

"Indeed, the accelerating increase in the power of banks is a direct result of the feverish pace of global corporate expansion. Banks have grown in large measure in the last ten years because the dynamic industries have high cash-flow requirements. Following their clients overseas, the largest banks have formed consortia to cap their control over the Eurodollar market. Although large industrial firms such as IBM and GM have traditionally financed most of their expansion from internal capital, they are increasingly resorting to outside financing, particularly for their foreign operations (over 30 percent of their capital requirements in the United States and 50 percent of their capital requirements overseas are met through outside financing). But despite the fact that banks hold large blocks of the stock of such corporations and have representatives on their boards, there is no evidence that the banks have 'taken over' these dynamic corporations. (It must be said at the outset, of course, that there is little evidence of anything concerning the internal relationships of banks and corporations because not only are the deliberations secret but much of the financial data to prove or disprove the thesis that banks dominate industry is also beyond the examination of the Executive, Congress, or the public.) That role of outside financing for U.S.-based global corporations, however, has now become most crucial as the need for additional capital to keep pace with Japanese and European competitors becomes more acute. German and Japanese banks directly control major industries in their countries. Oligopolistic competition may well encourage similar developments in the United States.

The Use of Financial Power

"Thus in the nonregulated growth industries, principally the global giants we have been considering up to now, the question whether banks use their financial power and stockholdings to dictate to the management of such firms scarcely arises because their interests are the same. The bank is as interested as the corporation's own management in promoting corporate policies that will produce growth so that

its holdings will appreciate and its loans will be repaid. Edward S. Herman, professor of finance at the Wharton School, puts it this way:

"What impresses me most in examining intercorporate relationships is not centralized control, banker or otherwise, but the network of personal and business affiliations and contacts and the mutual supportive character of so much of the business system. . . . One can deduce that activities carried out by substantial business firms, no matter how odious, will not be subject to open criticism by important businessmen who are part of the corporate-banking network. If [Dow, GE, Honeywell, North American Rockwell and other major Vietnam war suppliers] were to produce gas chambers under contract with the Pentagon, their decisions would be accepted in silence by the community of leading business firms.'

The Use of Concentrated Financial Power Against the Public

"The issue, it seems to us, is not whether the interests of bankers and the interests of corporate management are in conflict but whether bankers are in a position to use their concentrated financial power against the public interest.

"When we turn to the regulated sector of the U.S. economy, however, a different picture emerges. It is in the regulated industries that the banks' 'enormous potential power for good or evil' is crucial. These industries – power companies, airlines, radio and television, railroads, telephone companies – represent essential services of the society, the social infrastructure on which all other economic growth depends. The one characteristic of these companies is that they are all heavily subsidized by government. Though all are technically private firms, and are privately owned, the government will not allow any of them to stop performing its essential services. They cannot be permitted to go out of business however great their financial losses.

The Power of Banks Over the Transportation Sector

"The power of banks over the transportation sector and how that power is used has recently been illustrated by the Penn Center debacle. The Patman Subcommittee notes that 'a number of financial institutions played a major and perhaps dominant role in the management of the Penn Central and its predecessors.' The chairman of the world's largest privately owned railroad at the time it went into bankruptcy was Stuart T. Saunders, a director of the Chase Manhattan Bank and of the large Philadelphia commercial bank First Pennsylvania Banking and Trust Company. Chase and its closely interlocked ally Morgan Guaranty were major creditors of the railroad. The chief financial officer of the railroad was David C. Bevan, president of a large Philadelphia bank. Beginning in 1963 at the behest of these and other bankers who dominated the railroad's board, Penn Central began a major diversification program, principally into real estate, with the heavy use of commercial bank loans. At a time when service was

declining and rolling stock needed replacement, the Patman Subcommittee notes, the real estate operations 'were competing with the Railroad for the same limited sources of credit at a time when the Railroad was having trouble obtaining needed financing.' In short, Penn Central's finance capital was used to cross-subsidize the real estate expansion. The 'disastrous expansion program,' according to the Subcommittee, produced a net cash drain of \$175 million. The same bankers in charge of Penn Central had also pushed heavily for a merger with the New York central two years before the final collapse. 'Thus, we see,' the Subcommittee report notes, 'that those most anxious to see the merger consummated were people in the financial aspects of the transaction, and who knew or cared little or nothing about running a railroad. Ultimately, the financial experts' judgment proved to be disastrous.'

"It is characteristic of regulated industries that they incur much greater debt than other firms dare incur. The reason they are such good customers for banks is that they are stable. Their growth rates are steady and predictable, their stocks have high yields, and they cannot be permitted to go out of business. It is the near-certain prospect of government rescue that makes no risk social-infrastructure investment attractive for banks. Unlike the situation in the private sector, where fairly large corporations can disappear, even bankruptcy does not mean the end of a railroad, airline, or major military contractor or a default on its loans. If necessary, the Federal Government will keep it in operation and eventually satisfy its creditors.

Corporate Socialism

"This arrangement which would make Adam Smith wince, might be termed bankers' socialism. A good illustration of how it works is seen in the case of the 1971 Lockheed loan. In 1969, Lockheed, then the number one defense contractor, borrowed \$400 million from a consortium of 24 banks. In 1970, while working on the L-1011 Airbus, the company ran into such serious financial difficulty that bankruptcy seemed imminent. Six representatives of the major banks that had lent the \$400 million met in March of that year with Deputy Secretary of Defense David Packard to negotiate their rescue. The result was a \$250-million loan guarantee, which the Nixon Administration proposed and the congress narrowly passed in August 1971, by which the U.S. taxpayer relieved the rescuing banks of all risk. The case illustrates the hold that huge corporations – particularly those in transportation, utilities, and the defense industry – have on the rest of the society. Despite its inefficiency and mismanagement, Lockheed was subsidized by the U.S. taxpayer because of its very size. Too much was at stake to permit Lockheed to fail – 24,000 jobs, \$2.5 billion in outstanding contracts, \$240 million advanced by airlines. (The collapse of Lockheed, the banks argued in support of the rescue operation, would lead to the collapse of TWA.) A number of the same banks that had lent so much money to Lockheed (Chase, Morgan Guaranty, Bank of America,

Wells Fargo, Bankers Trust) had also lend money to the major airlines threatened by a Lockheed bankruptcy.

The Powers of Bankers over Public Utilities

"If we turn our attention to the public utilities, we see the same combination of huge external debt owed to banks and the heavy representation of bankers on the board of directors that we saw in the Penn Central case. Consolidated Edison of New York, the power company that services the New York City area, operates under a board of directors made up of individuals who are also directors of some of the country's largest banks and insurance companies: Manufacturers Hanover, Metropolitan Life, First National City, Chemical Bank. Indeed, not only is Con Ed dominated by men with important bank connections, but the great majority of such connections are with institutions included within the Rockefeller-Morgan network. Six of the ten largest shareholders are commercial banks. (Indeed, according to Senator Lee Metcalf's investigations, Chase Manhattan is among the top ten holders of 42 utilities, Morgan Guaranty Trust is among the top ten of 41 utilities, Manufacturers Hanover Trust is among the top ten of 31 utilities.)

Good Customers for Banks

"Utilities are exceedingly good customers for banks. More than 50 percent of the total capitalization of Con Ed of New York is in long-term debt financing. Because it is a regulated monopoly, it need fear no competition. Its customers have nowhere else to turn to run their electric kitchens or their office-building elevators and air conditioners. Bronx Borough President Robert Abrams calls this enviable position 'a cost-plus relationship with society.' Utilities, he charges, need not cut costs to maintain profits. They need merely raise prices to the customers. Between 1964 and 1969, Con Ed reduced the amount spent on plant additions nearly 10 percent at a time when expansion of service was clearly needed, but increased its payments to the holders of its long-term debt by about 9 percent a year. (By 1969 the power company was paying 93 percent of its annual income to banks and other holders of its stocks and bonds.) No one can prove a direct relationship between this sort of financial management and the persistent power failures that plague the city of New York, but the New York State Public Service Commission blames Con Ed's faulty equipment for the massive 1973 power failure in Queens. There is strong evidence here, as in the Penn Central case, that putting bankers in charge of public utilities is no way to run either a power company or a railroad.

"A whirlwind tour of who owns America, such as we have just completed, is essential to an understanding of the preeminent power of the global corporations over American society. Moreover, as we noted in our discussion of Latin America, one cannot understand global corporations without comprehending their interconnections with global banks. There is also an intimate and necessary

connection between growth and concentration. In a world dominated by oligopolistic competition, the quest for the one leads inevitably to the other.

A Few Hundred Individuals Exercise Tremendous Power

"The result is that managerial control of the technology, the finance capital, and the instruments for developing and disseminating ideology vest in a few hundred individuals. The principal decision makers in the 200 top industrial corporations and the 20 largest banks, which control such a huge proportion of the nation's wealth and its capacity to produce wealth, number fewer than a thousand persons. These individuals are the planners for our society." (Richard J. Barnet & Ronald E. Muller, pp. 239-245.

Part XVI – The Business Interlock and Use of Government

Barnet and Muller next outline the tremendous interlock which exists in America between the large corporations and government. Monopolies and cartels could not exist without the aid of regulatory agencies, either at the national or international level. Government regulations destroy smaller businesses and corporations through the compliance cost of their rules. The large corporations push for government regulation in order to destroy competition and pave the way for mergers and acquisitions. The result is the gradual elimination of the small business. The large corporations have become quite adept at using taxpayers' money for their private agendas. For example, they use taxpayer money to clean up the environment when they should be paying for the cleanup themselves. The alliance of government and business is nothing more than corporate socialism, however, the taxpayers never receive any dividends. Government regulators float from government service to corporate service and vice versa. When government enters the market place unconstitutionally, competition is curtailed and the giant companies only become larger. Barnet and Muller note that:

"Ever-greater concentration of economic power through a process of cross-subsidization across industrial sectors and geographical frontiers is now a crucial dynamic of the world political economy. The acceleration of this process by which a small number of large economic units employ their advantages to acquire ever-greater market shares appears inescapable as long as corporate executives and government managers continue to think as they now do. One reason why concentration is proceeding at an exponential rate is the rapid erosion of sources of national power that might have been expected to restrain this expansionary process.

Little Opposition to Corporate Takeover

"We must now ask the same crucial political question about the united States we posed in connection with Latin America: why is there so little countervailing power to resist the corporate takeover? If our analysis is correct that global banks

are increasingly coming to dominate the vital social services of the society – transport, utilities, etc. – and are using their enormous influence to promote good financial return often at the expense of good public service, why has this been allowed to happen? If global corporations, having assumed the principal planning power in our society, are unable to deal satisfactorily with our major social problems – inflation, unemployment, the energy crisis, pollution – why do they continue to exercise such power?

The Obvious Candidates to Oppose the Power of the Global Corporations

"The answer is structural weakness in major institutions of our national life, which might have been expected to balance off the power of the global corporations. As a result, the United States is looking more and more like an underdeveloped country. As in Latin America, the obvious candidates to oppose the power of the corporations – labor unions, small businessmen, and, especially, the government – are completely inadequate. Why should this be so?

The Decline of the Small Businessman

"Of these three candidates, we shall have little say here about the first two. The decline of the power of labor in the face of the globalization of business is so important a matter that it deserves a separate chapter. The decline of small business and regional business is a vital part of the structural transformation in the American economy, but it is a relatively simple matter to explain. During the nineteenth century and the early years of the twentieth century, interests of Southern farmers, New England millowners, and New York bankers often conflicted, and these regional and sectional differences served to fractionate and hence to check the power of business as a whole. By the mid-twentieth century, however, the United States had been fully integrated into a national market and these historic conflicts among entrepreneurs had largely disappeared. The same techniques now being used to develop the global market – modern transportation, accounting, marketing, etc. – were successfully employed to create the integrated U.S. market, and in the process local pockets of resistance to the march of the great corporations were eliminated. The decline of competition and the disappearance of thousands of small firms with competing interests have consolidated the political power of the business.

Government Lacks the Power to Control Global Corporations

"But why does government lack the power to control global corporations? In Latin America, as we saw, government bureaucracy is weak, corrupt, and inefficient, but the Nixon scandals notwithstanding, that is hardly a fair description of the U.S. Government. Inefficiency abounds and corruption exists, but the government is not weak. Indeed, over the past generation, the Federal state apparatus has claimed and exercised ever-greater power. The centralization of authority over the economy in the Executive Branch and, finally, in the President's

office has made this the era of Big Government. Yet Big Government is unable to control Big Business.

The Dominant Ideologies in Mid-Century America

"The easy explanation is that politicians who achieve high office and the public administrators they appoint have little desire to control the expansion and exercise of corporate power. The dominant ideology in mid-century America is the celebration of growth and bigness. No government dedicated to steady, spectacular economic growth as the prime tool for maintaining social peace can afford to take a tough line with big corporations. For those who have come to power in America in the last thirty years, the notion that there were any fundamental conflicts between corporate interests and the public interest simply did not arise. The power of the United States rested so clearly on the power of the great corporations.

Large Businesses Control the Government

"Therefore, it has seemed quite reasonable to the last five administrations to staff those parts of the Federal Government that regulate the economy with men on loan from the great corporations and banks. The Federal Government is in a position to exercise little countervailing power against big corporations in large measure because of government-business interlocks in the most strategic areas of the economy. The interlocking process begins with the campaign contribution. The stark truth is that no one can be elected President of the United States under our present system without massive financial contributions from big business. This has been a fact for almost one hundred years, but its true significance was dramatized in the Nixon Administration. So anxious were the managers of such corporations as Gulf Oil, Braniff Airways, Phillips Petroleum, Ashland Oil, American Airlines, Minnesota Mining and Manufacturing, Goodyear Tire and Rubber, and Carnation to contribute to the President's already overflowing campaign chest that they broke the law (for which they received suspended jail sentences and small fines). It is clear from the behavior of ITT, milk producers, and banks that corporations regard campaign contributions as investments, not charity. They are buying shares in an Administration which they have reason to expect will be responsive to their interests.

Major Corporate Contributors to President Richard Nixon

"Here is a list of some of the major corporate contributors to the Nixon 1972 campaign:

Robert Allen	Gulf Resources & Chemical Corp.	\$100,000
	American Airlines	\$75,000
Elmer Bobst	Warner-Lambert Pharmaceutical Co.	\$100,000

Nathan Cummings	Consolidated Foods Corp.; board chairman, Assoc. Products Inc. (manufacturing and wholesale food)	\$44,356
Frederick L. Ehrman Harvey, Leonard &	Lehman Corp. (investment banking)	\$63,578
Raymond Firestone	Firestone Tire & Rubber Co.	\$212,153
Max M. Fisher	Chairman, Fisher – New Center Co., cochairman, Finance Committee	\$125,000
Henry Ford II & Family	Ford Motor Company	\$99,775
J. Paul Getty	Getty Oil	\$75,000
Howard Hughes	National Airlines	\$150,000
	Standard Oil Co. of California	\$50,000
	Phillips Petroleum Co.	\$100,000
John A. Mulcahy	President, Quickly Co. (steel subsidiary of Pfizer, Inc., pharmaceuticals)	\$573,559
W. Clement Stone	Combined Insurance Co. of America	\$2,000,000
Arthur K. Watson	Former board chairman, IBM World Trade	\$300,000
Claude C. Wild	Gulf Oil Corp.	\$100,000

"(Some of Mr. Nixon's ambassadorial appointees from large corporations apparently felt a touching sense of obligation to the man who made it possible for them to be addressed for life as 'your Excellency.' The ambassadors to Ireland, France, Britain, Jamaica, Switzerland, Trinidad, and the Netherlands together invested slightly over \$1 million in the 1972 campaign.)"

Regulatory Agencies Are Dominated by Industry

"From the start, regulatory agencies have been dominated by the industries they were supposed to regulate. When the first regulatory agency, the Interstate Commerce Commission, was being debated in 1884, Charles Adams, director and

later president of the Union Pacific Railroad, characterized with refreshing candor what is still the predominant attitude of industry toward Federal regulation. Writing to a Massachusetts Congressman who had asked his help in defeating a 'radical' regulatory measure, he observed:

"What is desired, if I understand it . . . is something having a good sound, which will impress the popular mind with the idea that a great deal is being done, when, in reality, very little is intended to be done.'

Regulatory Agencies Are Captives of Industry

"As the historian Gabriel Kolko has shown, the railroads were proponents of moderate regulatory legislation as an alternative to the tougher measures the anti-railroad forces in the country were pushing. The ICC was staffed from the beginning with a high proportion of railroad lawyers and others sympathetic to the industry. The ICC is still dominated by pro-industry commissioners. Whether one accepts Kolko's view that regulatory agencies have always been captives of the industries they are supposed to regulate or the more conventional view that they begin as crusaders and gradually ossify, the effect is the same. In the words of former Federal Communications Commissioner Nicholas Johnson, the regulatory agency is now 'a leaning tower of Jell-o.'

The Revolving Door

"An impressive qualification for becoming an FCC commissioner is to own a television station, just as it is helpful to have worked for the gas industry if you want to serve on the Federal Power Commission. The plausible argument for taking businessmen on loan to be regulators of their own industry is that they are the ones with the experience to do the job. But the theory that it takes one to catch one is contradicted by consistent practice. The business journal *Forbes* notes that 'it is hard to see how the troubled natural gas industry could have a regulator more to its tastes than the new chairman of the Federal Power Commission' (John N. Nassikas, a Manchester, New Hampshire, utilities lawyer). Other recent FPC commissioners include Rush Moody, Jr., a Texas lawyer representing Pennzoil, an oil conglomerate; and Carl E. Baggee, a Boise lawyer who also represented Pennzoil. In 1972 the Federal Power Commission granted the natural-gas industry huge price increases and, in the words of former FPC Chairman Lee White, 'abandoned the consumer.'

Big Business and Big Government Interlock

"The value of your stock will rise,' Wright Patman pointed out to David Kennedy during the Secretary of the Treasury's testimony in favor of the one-bank holding company. (Kennedy still had major stockholdings in Continental Illinois National Bank and Trust Company, of which he had been chairman and to which he would soon return.) Bankers in government have been protective of their own

interests, as have businessmen on loan from utilities and defense contractors. To a greater or lesser degree this has always been true since the United States became an industrial nation. The government-business interlock goes a long way to explain why the world's most powerful government is ineffective in checking the expanding power of business. To a significant degree, Big Business and Big Government represent identical interests." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 246-252.)

Part XVII – Central Economic Planning in the Industrial Sector

Earlier we mentioned that large corporations favor centralized economic planning. Barnet and Muller outlined the planning currently underway in the industrial sector. They stated that:

". . . [T]here is a connection between the mounting instability in the United States (and other advanced capitalist states) and the structural changes in the world political economy that we have been tracing. A global transformation has been taking place in the private productive system which has not been reflected in government. The driving force behind the globalization of industry is a managerial revolution that has made it possible to centralize industrial planning on a global scale. As the Senate Finance Committee report on U.S. global firms puts it:

"The coordination of MNC [multinational corporations] operations requires planning and systemization of control of a high order. In the largest and most sophisticated MNC's, planning and subsequent monitoring of plan fulfillment have reached a scope and level of detail that, ironically, resemble more than superficially the national planning procedures of Communist countries.'

The Revolution in Private Industry

"But the managerial revolution in private industry has not been duplicated in government. The public sector had its managerial revolution under the banner of Keynesianism almost forty years ago. . . .

"Centralized planning for a centralized system of profit maximization leads inevitably to economic concentration, because only by expanding or at least maintaining its share of the market can an oligopolistic firm hope to compete successfully with the other giants. Where a small number of such firms pursue similar strategies for growth by extending their control more and more into new industries, new products, and new geographic regions, the result is what Robert Averitt has termed a 'dual economy.' (This characterization was once reserved for underdeveloped countries.) The 'center' economy, comprised a few hundred firms, controls over 60 percent of the productive and financial resources of the country and employs the bulk of organized labor. The 'periphery' economy is made up of thousands of smaller firms dependent on the giants for their survival, and whose

workers do not normally belong to unions. . . ." (Richard J. Barnet & Ronald E. Muller, *Global Reach*, pp. 255-256.)

Part XVIII – Creation of the Soviet Union and China

Earlier we pointed out that the elite who run the world's major corporations had financed the early development of the Soviet Union and later, China. Documentation for this incredible occurrence was provided by Antony Sutton, former Research Fellow at the Hoover Institute on War and Peace at Stanford, in a three volume work entitled, *Western Technology and Soviet Economic Development* and in *Wall Street and the Bolshevik Revolution*. To the world-at-large it seems like the East is arrayed against the West. A closer look at the conflict reveals that an ideological facade has been deliberately constructed to deceive the people of the world. The Western World is currently "managed" by an elite power structure consisting of less than a thousand corporate directors and international bankers. Russia and China are also "managed" by an elite power structure. The elites from both power structures have worked closely with each other since the Bolshevik Revolution and the Chinese Revolution. They favor and adhere to the same ideologies of monopoly capitalism, finance capitalism, civil law, secularism, socialism and communism. Since communism arose in Russia and China, the elite have been engaged in creating a "new Imperial System" to "manage" the earth, its people and resources. The Western World not only created the Soviet industrial and military systems but has subsidized it since 1917. The elite power structure of the West is currently in the process of industrializing China.

Western Technology and Soviet Economic Development

Anthony Sutton's exhaustive and scholarly works provide ample documentation that the West has built the Soviet Union. In a section of *Western Technology and Soviet Economic Development* entitled, "National Security and Technical Transfer," Anthony Sutton noted:

"The major conclusions presented by this study are that Western technology has been, and continues to be, the most important factor in Soviet economic development. The technical transfers that have fostered this development have continued over a period of 50 years. These observations will now be related to the declared hostility of the U.S.S.R. to the West since 1917, a hostility such that the United States alone apparently requires annual defense expenditures in excess of \$80 billion (1969) to counter the threat.

U.S. Policy Regarding Technical Transfers to Soviet Union

"That the Soviets have openly and consistently advocated the overthrow of Western democratic systems from 1917 to the present time is a fundamental starting point for the development of our national security policies. Rationality suggests, therefore, that either our policy regarding technical transfers to the Soviet

Union is in error or our inflated annual defense expenditure is unnecessary. Either there is no valid rationale for much of our trade with the Soviets, i.e., for the main vehicle of technical transfers, or there is no valid rationale for defense against the Soviets. The two policies are incompatible....

"A rational policy for any nation is one based on logical deduction from empirical observation. If a policy is based on erroneous information or on lack of facts, or if it is developed from accurate data by nonlogical, i.e., mystical, methods, the policy is not likely to achieve its objectives.

The Western Policy Toward U.S.S.R

"There is adequate reason to believe that Western policy toward the U.S.S.R. in the field of economic relations is based, first, on an inadequate observation of fact, and second, on invalid assumptions. In no other way can one explain the extraordinary statements made, for example, by State Department officials in Congress, by academic writers, and by 50 years of policies which prescribe first the establishment and then the continuing subsidy of a system that simultaneously calls forth massive armaments expenditures. Those countries which have been the prime technical subsidizers of the U.S.S.R. are also the countries with the largest expenditures on armaments against a presumably real threat from the Soviet Union.

The First Requirement of a Rational Policy in Economic Relations

"The first requirement of a rational policy in economic relations between the Western world and any communist state is to determine the empirical facts governing both economic and strategic-military relations. These three volumes have established, from a precise technical examination, that the Soviet Union and its socialist allies are dependent on the Western world for technical and economic viability. At any time the West chooses to withdraw this technical and economic subsidy, the Soviet Union must either meet terms laid down by the West or effect within its own system the changes needed to achieve self-generated innovation. The major temporal and political demands of the second course suggest that the Soviet Union would come to terms. The West, then, has the option of taking major steps toward developing world peace.

"To subsidize and support a system that is the object of massive military expenditures is both illogical and irrational. In other words, it calls into question not only the ability and wisdom but indeed the basic common sense of the policymakers.

The Choice Is Clear

"The choice therefore is clear; either the West should abandon massive armaments expenditures because the Soviet Union is not an enemy of the West, or

it should abandon the technical transfers that make it possible for the Soviet Union to pose the threat to the Free World which is the *raison d'etre* for such a large share of Western expenditures...." (Antony C. Sutton, *Western Technology and Soviet Economic Development, 1945 to 1965*, Stanford, California: Hoover Institution Press, 1973, pp. 381 & 400.)

Central Economic Planning Will Not Work

Antony Sutton was one of the first economic analysts to point out that central economic planning cannot sustain itself. He noted:

"The prolific literature on central economic planning published in this century contains no discussion – or even passing mention – of one apparently essential prerequisite: there must be systems not regulated strictly by central planning that are willing to provide technical services and productive units for the centrally planned system. A world of strictly centrally planned systems based on the Soviet model, or a single centrally planned world system, could not progress. It would choke on technical inertia. The Soviet state's dependence on the West was at least partly recognized by Lenin, and it is effectively conceded by present-day Soviet leaders when they openly subscribe to advances in Western technology – not omitting, of course, politically necessary references to capitalism's 'internal contradictions'.

"The outstanding achievement of central planning is its ability to realize substantial rates of growth through planned diversion of resources and efforts into chosen industrial sectors. Let us accept as a premise that over the course of 50 years Soviet growth rates in most sectors have been substantial. Iron and steel production is certainly one such sector: Russian pig-iron production was 4.2 million tons in 1913 and 70.3 million metric tons in 1966, while steel production was 4.3 million tons in 1913 and 96.9 million tons in 1966. Fertilizer production was 42,000 tons in 1913 and 6.9 million tons in 1966. Chemical fiber production was zero in 1913 and 458,000 tons in 1966.² Ship production totaled 1.75 million gross registered tons in 1914 and 11 million gross registered tons in 1967.³

Significant Acquisition of Western Technology

"In each case of exceptional rates of growth we find significant acquisition of Western technology at the start of the rise in growth; indeed, it is a matter of open record that increments in output were planned to be at least initially dependent on the West. The planned increment in production was achieved in a conscious manner, not by internal technical resources, but by the purchase of high-productivity advanced units in the West.

"Could the Soviet system have attained high rates of growth in any single sector without outside injections of technology and capacity? The answer is: apparently not. At any rate, no example has been found of a sector in the Soviet economy

achieving rapid rates of growth without technical injections from outside the system. The sector that has come closest to showing indigenous technical progress is the iron and steel industry, with Western technology first absorbed and then scaled up to provide massive increments in pig iron and raw steel output. However, with this sequence the sector's progress has been limited: full modern industrialization demands not only a balanced output of iron and raw steel but also of finished rolled products. Rolling is not subject to scaling-up innovation. One can quadruple the size of an open hearth or a blast furnace, but quadrupling the size of a blooming mill, and certainly a wide-strip mill, is technically impossible. The continuous casting process was seen as a way around the problems posed by the blooming mill, i.e., as a way to replace scaling up, but here, as we have soon, too-rapid introduction brought its own problems.

The Demands of Soviet Central Planning

"The logical conclusion, therefore, is that Soviet central planning absolutely demanded from the outset, and still demands, the existence of technically balanced systems from which it might leach new processes and purchase productive capacity. In the absence of such systems, it probably could not have made great technical progress....

Careful Concealment and Clever Production

"The Soviet economy is always a few years behind the West, but under censorship conditions this has presented no great problem. By a combination of careful concealment and clever promotion,¹⁶ the Soviets have had little difficulty in presenting to foreign observers the facade of a vigorous, sophisticated technology." (Antony C. Sutton, *Western Technology and Soviet Economic Development*, pp. 401-402, 410.)

Research Findings Ignored by Intellectual Community

The research findings of Antony Sutton have been discarded by the intellectual community of the Western World. Undoubtedly the main reason for such a rejection comes from the fact that his research reveals how the elite in the West and the East have cooperated together to build giant monopolies on the earth and to maintain positions of power over large masses of people. His research shows how the multinational corporate directors and the international bankers have deliberately created a "so-called enemy" which they control through financial machinations. Sutton's findings adequately demonstrate that the "new Imperial System" under construction is based upon communism and socialism as well as monopolistic practices, civil law and secularism. The large corporations have been preparing the inhabitants of the world for convergence and habitation in a global system of governance where the elite of the world "manage" the world – its people and resources – under large corporate structures.

Sutton's conclusion states: "The first volume of this study concluded that the Soviets employed more than 350 foreign concessions during the 1920s. These concessions, introduced into the Soviet Union under Lenin's New Economic Policy, enabled foreign entrepreneurs to establish business operations in the Soviet Union without gaining property rights. The Soviet intent was to introduce foreign capital and skills, and the objective was to establish concessions in all sectors of the economy and thereby introduce Western techniques into the dormant post revolutionary Russian economy. The foreign entrepreneur hoped to make a normal business profit in these operations.

Foreign Concessions

"Three type of concessions were isolated: Type I, pure concessions; Type II, mixed concessions; Type III, technical-assistance agreements. Information was acquired on about 70 percent of those actually placed in operation. It was found that concessions were employed within all sectors of the economy except one (furniture and fittings), although the largest single group of concessions was in raw materials development. In the Caucasus oil fields – then seen as the key to economic recovery by virtue of the foreign exchange that oil exports would generate – the International Barnsdall Corporation introduced American rotary drilling techniques and pumping technology. By the end of the 1920s 80 percent of Soviet oil drilling was conducted by the American rotary technique; there had been no rotary drilling at all in Russia at the time of the Revolution. International Barnsdall also introduced a technical revolution in oil pumping and electrification of oil fields. All refineries were built by foreign corporations, although only one, the Standard Oil lease at Batum, was under a concessionary arrangement – the remainder were built under contract. Numerous Type I and Type III technical-assistance concessions were granted in the coal, anthracite, and mining industries, including the largest concession, that of Lena Goldfields, Ltd., which operated some 13 distinct and widely separated industrial complexes by the late 1920s. In sectors such as iron and steel, and particularly in the machinery and electrical equipment manufacturing sectors, numerous agreements were made between trusts and larger individual Tsarist-era plants and Western companies to start up and reequip the plants with the latest in Western technology, A.E.G., General Electric, and Metropolitan-Vickers were the major operators in the machinery sectors. Only in the agricultural sector was the concession a failure.

Western Assistance to U.S.S.R.

"After information had been acquired on as many such concessions and technical-assistance agreements as possible, the economy was divided into 44 sectors and the impact of concessions and foreign technical assistance in each sector was analyzed. It was found that about two-thirds of the sectors received Type I and Type II concessions, while over four-fifths received technical-assistance agreements with foreign companies. A summary statement of this

assistance, irrespective of the types of concession, revealed that all sectors except one, i.e., 43 sectors of a total of 44, had received some form of concession agreement. In other words, in only one sector was there no evidence of Western technological assistance received at some point during the 1920s. The agreements were made either with dominant trusts or with larger individual plants, but as each sector at the outset comprised only a few large units bequeathed by the Tsarist industrial structure, it was found that the skills transferred were easily diffused within a sector and then supplemented by imported equipment. Examination of reports by Western engineers concerning individual plants confirmed that restarting after the Revolution and technical progress during the decade were dependent on Western assistance.

Foreign Entrepreneurs and Firms Enter Soviet Union

"It was therefore concluded that the technical transfer aspect of the New Economic Policy was successful. It enabled foreign entrepreneurs and firms to enter the Soviet Union. From a production of almost zero in 1922 there was a recovery to pre-World War I production figures by 1928. There is no question that the turn-around in Soviet economic fortunes in 1922 is to be linked to German technical assistance, particularly that forthcoming after the Treaty of Rapallo on April 1922 (although this assistance was foreseeable as early as 1917 when the Germans financed the Revolution).

Joint Trading Firms Established With Assistance of Western Businessmen

"It was also determined that the forerunners of Soviet trading companies abroad – i.e., the joint trading firms – were largely established with the assistance of sympathetic Western businessmen. After the initial contacts were made, these joint trading firms disappeared, to be replaced by Soviet-operated units such as Amtorg in the United States and Arcos in the United Kingdom.

"It was concluded that for the period 1917 to 1930 Western assistance in various forms was the single most important factor first in the sheer survival of the Soviet regime and secondly in industrial progress to prerevolutionary levels.

Empirical Conclusions: 1930 to 1945

"Most of the 350 foreign concessions of the 1920s had been liquidated by 1930. Only those entrepreneurs with political significance for the Soviets received compensation, but for those few that did (for example, Hammer and Harriman), the compensation was reasonable.

"The concession was replaced by the technical-assistance agreement, which together with imports of foreign equipment and its subsequent standardization and duplication, constituted the principal means of development during the period 1930 to 1945.

Albert Kahn, Inc. of Detroit

"The general design and supervision of construction, and much of the supply of equipment for the gigantic plants built between 1929 and 1933 was provided by Albert Kahn, Inc., of Detroit, the then most famous of U.S. industrial architectural firms. No large unit of the construction program in those years was without foreign technical assistance, and because Soviet machine tool production then was limited to the most elementary types, all production equipment in these plants was foreign. Soviet sources indicate that 300,000 high-quality foreign machine tools were imported between 1929 and 1940. These machine tools were supplemented by complete industrial plans: for example, the Soviet Union received three tractor plants (which also doubled as tank producers), two giant machine-building plants (Kramatorsk and Uralmash), three major automobile plants, numerous oil refining units, aircraft plants, and tube mills.

A Dozen Top U.S. Companies Involved in U.S.S.R.'s Industrial Development

"Published data on the Soviet 'Plans' neglect to mention a fundamental feature of the Soviet industrial structure in this period: the giant units were built by foreign companies at the very beginning of the 1930s, and the remainder of the decade was devoted to bringing these giants into full production and building satellite assembly and input-supply plants. In sectors such as oil refining and aircraft, where further construction was undertaken at the end of the decade, we find a dozen top U.S. companies (McKee, Lummus, Universal Oil Products, etc.) aiding in the oil-refining sector and other top U.S. aircraft builders in the aircraft sector (Douglas, Vultee, Curtiss-Wright, etc.).

"Only relatively insignificant Soviet innovation occurred in this period: SK-B synthetic rubber, dropped in favor of more useful foreign types after World War II; the Ramzin once-through boiler, confined to small sizes; the turbodrill; and a few aircraft and machine gun designs.

Continual Flow of Western Equipment to Soviets

"The Nazi-Soviet pact and Lend Lease ensured a continued flow of Western equipment up to 1945.

"In sum, the Soviet industrial structure in 1945 consisted of large units producing uninterrupted runs of standardized models copied from foreign designs and manufactured with foreign equipment. Where industrial equipment was of elementary construction (e.g., roasters and furnaces in the chemical industry, turret lathes in the machine tool industry, wooden aircraft, and small ships), the Soviets in 1945 were able to take a foreign design and move into production. One prominent example ... was the Caterpillar D-7 tractor. The original, sent under Lend Lease in 1943, was copied in metric form and became the Soviet S-80 and S-100. It was then adapted for dozens of other military and industrial uses.

Massive Flow of Western Technology

"Thus in the period 1930 to 1945 the Soviets generally no longer required foreign engineers as operators inside the U.S.S.R. as they had in the concessions of the 1920s, but they still required foreign designs, foreign machines (the machines to produce machines), and complete foreign plants in new technical areas. By 1945 the Soviet Union had 'caught up' at least twice; once in the 1930s (it could also be argued that the assistance of the 1920s constituted the first catching-up) with the construction of the First Five Year Plan by foreign companies, and again in 1945 as a result of the massive flow of Western technology under Lend Lease. While the technical skills demonstrated by the Tsarist craftsmen had not quite been achieved, it may be said that in 1945 the nucleus of a skilled engineering force was once again available in Russia – for the first time since the Revolution.

Empirical Conclusions: 1945 to 1965

"In the immediate postwar period the Soviets transferred a large proportion of German industry to the Soviet Union – at least two thirds of the German aircraft industry, the major part of the rocket production industry, probably two-thirds of the electrical industry, several automobile plants, several hundred large ships, and specialized plants to produce instruments, military equipment, armaments, and weapons systems. The stripping of East Germany was supplemented by a U.S. program (Operation RAP) to give the Soviets dismantled plants in the U.S. Zone. By the end of 1946 about 95 percent of dismantling in the U.S. Zone was for the U.S.S.R. (including the aircraft plants of Daimler-Benz, ball bearings facilities, and several munitions plants).

U.S. Export-Import Bank Credits

"Manchuria and Rumania also supplied numerous plants. And as we have seen, Finnish reparations which supplemented the pulp and paper industries and ship construction were made possible by U.S. Export-Import Bank credits to Finland.

"In the late 1950s all this industrial capacity had been absorbed and the Soviets turned their attention to the deficient chemical, computer, shipbuilding, and consumer industries, for which German acquisitions had been relatively slight. A massive complete-plant purchasing program was begun in the late 1950s – for example, the Soviets bought at least 50 complete chemical plants between 1959 and 1963 for chemicals not previously produced in the U.S.S.R. A gigantic ship-purchasing program was then instituted, so that by 1967 about two-thirds of the Soviet merchant fleet had been built in the West. More difficulty was met in the acquisition of computers and similar advanced technologies, but a gradual weakening of Western export control under persistent Western business and political pressures produced a situation by the end of the sixties whereby the Soviets were able to purchase almost the very largest and fastest of Western computers.

Western Firms Selling to U.S.S.R.

"As a further indicator of Soviet technical backwardness, it may be noted that some Western firms selling to the Soviet Union have found 'so many gaps in the control schemes proposed that a two-phase quotation format has been adopted: first a feasibility study is conducted (for which the Western company is paid), and then the actual quotation is determined for a complete system based on the feasibility study. In other words, technical inadequacy is such that the Soviets have not been able to specify exactly what is wanted. What this reflects is not a lack of scientific skill; it shows a lack of information on the technical constituents of a modern industrial system.

U.S.S.R. – A Copy of the West

"In the few areas where indigenous innovation was identified in the earlier period, we find a move back toward the use of Western technology. This is visible in the use of Western synthetic rubbers to replace SK-B, a renewed research effort on rotary drilling as a result of efficiency problems encountered in the use of the Soviet turbodrill, and instances of abandonment of the Ramzin boiler in favor of Western designs. The research and development effort has continued, but its results in practical engineering terms have been near zero. From the technical viewpoint the Soviet Union at 1970 is a copy – a rather imperfect copy – of the West. Generally, initial units are still built by Western companies and subsequent units built by Soviet engineers are based on the original Western model, and imported equipment is used in key process and control areas.

A Persistent and Powerful Force in the West

"It may be unwise to attempt to read into an historical sequence of events as important as those described, any rational objective on the part of Western statesmen. Although the policies concerning trade and technical transfers appear vague and often confused, there is one fundamental observation to be made: throughout the period of 50 years from 1917 to 1970 there was a persistent, powerful, and not clearly identifiable force in the West making for continuance of the transfers. Surely the political power and influence of the Soviets was not sufficient alone to bring about such favorable Western policies. Indeed, in view of the aggressive nature of declared Soviet world objectives, such policies seem incomprehensible if the West's objective is to survive as an alliance of independent, non-communist nations. What, then, are the wellsprings of this phenomenon?

The Argument for Western Aid

"In the years 1917-20 a variant of the modern 'bridge-building' argument was influential within policymaking circles. The Bolsheviks were outlaws, so the argument went, and had to be brought into the civilized world. For example, in

1918 a statement by Edwin Gay, a member of the U.S. War Trade Board and former Dean of the Harvard Business School, was paraphrased in the board minutes as follows:

"Mr. Gay stated the opinion that it was doubtful whether the policy of blockade and economic isolation of these portions of Russia which were under Bolshevik control was the best policy for bringing about the establishment of a stable and proper Government in Russia. Mr. Gay suggested to the [War Trade] Board that if the people in the Bolshevik sections of Russia were given the opportunity to enjoy improved economic conditions, they would themselves bring about the establishment of a moderate and stable social order.'

Western Business Pressure

"At about the same time American businessmen were instrumental in aiding the formation of the Soviet Bureau, and several hundred firms had their names on file in the bureau when it was raided in 1918. Hence there was Western business pressure through political channels to establish Soviet trade. No one appears to have foreseen the possibility of creating a powerful and threatening enemy to the Free World. There was widespread criticism of the Bolsheviks, but this was not allowed to interfere with trade. In sum, there was no argument made against technical transfers while several influential political and business forces were working actively to open up trade.

Policy Formation at the U.S. State Department

"The lack of clear policy formulation and foresight was compounded by the apparent efforts of some State Department officials in the 1930s to discourage collection of information on Soviet economic actions and problems. While the First five Year Plan was under construction by Western companies, various internal State Department memoranda disputed the wisdom of collecting information on this construction. For example, a detailed report from the U.S. Embassy in Tokyo in 1933 (a report containing precisely the kind of information used in this study) was described in Washington as 'not of great interest.' It is therefore possible that no concerted effort to examine the roots of Soviet industrial development has ever been made within the U.S. State Department. Certainly internal State Department reports of the 1930s provide less information than the present study was able to develop. Such lack of ordered information would go far to account for many of the remarkably inaccurate statements made to Congress by officials of the State Department and its consultants in the 1950s and 1960s – statements sometimes so far removed from fact they might have been drawn from the pages of *Alice in Wonderland* rather than the testimony of senior U.S. Executive Department personnel and prominent academicians.

Very Little Public Knowledge About Technology Transfers to U.S.S.R.

"In brief, a possibility exists that there has been no real and pervasive knowledge of these technical transfers – even at the most 'informed' levels of Western governments. Further, it has to be hypothesized that the training of Western government officials is woefully deficient in the area of technology and development of economic systems, and that researchers have been either unable to visualize the possibility of Soviet technical dependence or unwilling, by reason of the bureaucratic aversion to 'rocking the boat,' to put forward research proposals to examine that possibility. This does not however explain why some of the outside consultants who were hired by all Western governments in such profusion, have not systematically explored the possibility. If it is argued, on the contrary, that Western Governments *are* aware of Soviet technical dependency, then how does one explain the national security problem....

The Argument for Technical Assistance to the U.S.S.R.

"An argument has been made that a policy of technical assistance to the U.S.S.R. before World War II was correct as it enabled the Soviets to withstand Hitler's attack of June 1941. This is *ex post facto* reasoning. The German Government financed the Bolshevik Revolution with the aim of removing an enemy (Tsarist Russia), but also with postwar trade and influence in mind. This German support was largely replaced in the late 1920s by American technical assistance, but until the mid-1930s the Germans were still arming the Soviets; it was only in 1939 that Hermann Goering began to protect the supply. Thus in the twenties and the early thirties it was not possible for anyone to foresee that Germany would attack the Soviet Union.

The Bolsheviks Were Assisted to Power by Germany

"The Bolsheviks were assisted to power by a single Western government, Germany, and were maintained in power by all major Western governments. The result is that we have created and continue to maintain what appears to be a first-order threat to the survival of Western civilization. This was done because in the West the political pressures for trade were stronger than any countervailing argument.

U.S. State Department Pressed for Transfer of Military Technology to U.S.S.R.

"This conclusion is supported by the observations that in both the 1930s and the 1960s the U.S. State Department pressed for the outright transfer of military technology to the U.S.S.R. over the protests of the War Department (in the thirties) and the Department of Defense (in the sixties). When in the 1930s the War Department pointed out that the proposed Dupont nitric acid plant had military potential, it was the State Department that allowed the Dupont contract to go

ahead. A Hercules Powder proposal to build a nitrocellulose plant was approved when the State Department accepted the argument that the explosives produced were intended for peacetime use.

"In the 1960s we have the extraordinary 'ball bearing case' of 1961, which revealed that the U.S.S.R. was to receive 45 machines used to produce miniature ball bearings (in the United States almost all miniature ball bearings are used in missiles). That proposal was called a 'tragic mistake' by the Department of Defense but supported by the State Department. In 1968 came the so-called 'Fiat deal' under which the United States supplied three-quarters of the equipment for the Volgograd plant, the largest automobile plant in the U.S.S.R. This agreement ignored an earlier interagency committee finding that 330 military items can be produced by any civilian automobile industry and that the automobile industry is a key factor for war. It also ignores an argument particularly stressed here – that any automobile plant can produce military vehicles. The supply of U.S. equipment for the Volgograd plant was diametrically opposed to any policy of denial of exports of strategic goods to the Soviet Union, for under any definition of 'strategic' the Volgograd plant has clear and significant military weapons capability. Yet the State Department was strongly in favor of the shipment of the plant equipment. The developing story of the Kama plant suggests history is repeating itself.

Gross Incompetence in the State Department

"Under these conditions, where policy is so far removed from logical deduction, it would be imprudent to arrive at any conclusion concerning Western intentions. If logical intentions exist...it is suggested that our strategic policies are not logically derivable from observable fact – that are obscure indeed. The writer leans to the position that there is gross incompetence in the policymaking and research sections of the State Department. There is probably no simple, logical explanation for the fact that we have constructed and maintain a first-order threat to Western society." (Antony C. Sutton, *Western Technology and Soviet Economic Development*, pp. 411-419.)

Through the process of industrial cooperation, inter-governmental economic agreements, barter and switching, licensing, leasing, co-production, joint ventures, mergers, acquisitions and alliances, the Western power structure has succeeded in creating a global system where the elites in China and Russia are prepared to participate with the elites in the United States, Europe, Asia and elsewhere in an effort to 'manage' the world in a "new Imperial System."

3. International Bankers – A World of Intrigue

Part I – Introduction

Money has a strange effect on people. Just mention its name and ears quickly perk up. It seems that practically everyone is interested in collecting it, even the Rothschilds.

The Evolution of Commerce and Banking

The history of money, its use and functions by people and civilizations throughout the world, is one of the most fascinating and intriguing subjects in existence. Surprisingly enough, the evolution of commerce and banking as practiced today had its origins in no other place than Babylonia. One history of banking states:

"Ancient Babylonia developed the first essentially commercial civilization. . . . Laws governed all business transactions. The Great King Hammurabi (2123-2081 B.C.) spelled out the laws of the land at the very outset of Babylonian history; these basic principles were followed in his nation for more than fifteen centuries. Interest was fixed at twenty percent for loans of money (measured weights of silver or gold), and thirty-three and one-third percent for loans in kind...."

Powerful Families Carry on the Business of Lending Money

"There were no banks in the strict sense of the world, but certain powerful families carried on the business of lending money. Loans were made on signatures, property and crops, which were attached in advance to insure repayment. The same men dealt in real estate, financed industrial enterprises, and acted as buying agents for clients. People who had funds on deposit with such men could pay their obligations by drafts, although their 'checks' were, of course, unwieldy in comparison with those we have today.

"...Babylonian business and financial methods provide the fundamental structure for the later commercial development of the world...." (*4000 Years of Banking*, Dayton, Ohio: National Cash Register, June 1970, p. 1.)

The Goldsmiths Discover the Secret of Banking and Credit

From the days of Babylonia until the present, "certain powerful families" have "carried on the business of lending money." To enrich the bankers, the use of debt and interest was developed into a highly efficient art over the centuries. Although banking has been in the hands of private individuals for nearly four thousand years, the development of commercial banking really blossomed in London in the 17th century. It was during this time that certain astute Englishmen and Europeans discovered the secret of banking and credit. They were called the "goldsmiths."

The goldsmiths were the manufacturers of various gold items. It seemed they always had an ample supply of this yellow substance on hand. To safeguard their precious alloy, they built strong vaults at their offices.

The Use of Goldsmith Receipts

During the 17th century a large percentage of trade and commerce was carried on in gold and silver. It is not surprising that merchants and others found it desirable to leave their gold at the goldsmiths. The merchants received a deposit slip or receipt for the amount which they had deposited. Since gold was so heavy, the owner began transacting his business via the use of the goldsmith's receipts.

The Goldsmiths Begin Collecting Interest

The clever goldsmiths soon discovered that it was quite unusual for the merchant or citizen to call for his gold. Since the receipts were being used as a medium of exchange, the goldsmith decided he would enter the banking business. He decided to begin collecting interest for the storage of gold and to begin making loans with an interest charge attached. He decided to issue more receipts than he had gold. Soon the goldsmith became exceedingly wealthy as a result of the interest on non-existent gold.

A Crime against Society

It wasn't long before the merchants and local citizens figured out how the goldsmith was making his money. When they came to collect their gold, they found there was none. Many a goldsmith was introduced to the gallows for his crime against society.

The Bank of Amsterdam

The first banking institution to follow the practice of the goldsmiths was the Bank of Amsterdam. It was established in 1609 in Amsterdam, Holland. The bank accepted deposits in gold, silver, etc., and issued separate receipts. Soon the receipts multiplied and were used as the medium of exchange in the country.

At first the bankers refused to issue more receipts than they had gold. However, it wasn't long until greed and the love of money replaced common sense and honest business practices. The old practice of the goldsmiths was reintroduced and paper receipts or loans were made on money (gold) which didn't exist.

A Run on the Bank

Everything went fine for the Amsterdam bankers until 1795 when the truth leaked out that a major fraud had been perpetrated. The bankers were collecting

interest on money which they had created out of thin air. A run on the bank resulted in the closure since the demand for gold far exceeded the bank's supply.

The collapse of the Amsterdam bank should have been a lesson for the people and bankers of Holland and Europe. However, it was soon forgotten. The bankers throughout Europe soon were up to their old tricks unbeknownst to the majority of the people.

Christian Teachings against Interest

In England the goldsmith's art of creating money with ledger entries was being perfected to a near science. For centuries, the Christians in England believed that it was contrary to the Bible to loan money at usury or interest. (See Deut. 23:19). It turned out, however, that the most prominent money lenders and goldsmiths in England and Europe did not follow the Old Testament teachings on usury.

Parliament Legalizes the Moneylending Practices of the Goldsmiths

The goldsmiths in England became so powerful that Parliament legalized their money lending practice in the 1690s. For sometime the money lenders had been taking the money out of circulation. By 1693 practically all of the money in England was stored in the vaults of the goldsmiths. They were becoming exceedingly rich on their high interest. The bankers were loaning up to ten times the amount of money which they possessed. It was during this time that King William III badly needed money for the war with Louis IV in France. The King requested a loan from the goldsmiths. The goldsmiths agreed, providing the Parliament and the King would grant them, (1) a charter to institutionalize their practices in the form of the Bank of England and (2) their request to issue currency against the gold in its vault. This was done and in 1694 the world's first privately owned central bank was established.

Part II – The Origins of the Bank of England

Concerning the origins of the Bank of England, professor Carroll Quigley, former professor of history at the Foreign Service School of Georgetown University has stated:

"Hundreds of years ago, bankers began to specialize, with the richer and more influential ones associated increasingly with foreign trade and foreign exchange transactions. Since these were richer and more cosmopolitan and increasingly concerned with questions of political significance, such as stability and debasements of currencies, war and peace, dynastic marriages, and worldwide trading monopolies, they became the financiers and financial advisers of governments. Moreover, since their relationships with governments were always in monetary terms and not real terms, and since they were always obsessed with the stability of monetary exchanges between one country's money and another, they

used their power and influence to do two things: (1) to get all money and debts expressed in terms of a strictly limited commodity – ultimately gold; and (2) to get all monetary matters out of the control of governments and political authority, on the grounds that they would be handled better by private banking interests in terms of such a stable value as gold....

England Discovers the Secret of Credit

"Britain's victories over Louis XIV in the period 1667-1715 and over the French Revolutionary governments and Napoleon in 1792-1815 had many causes, such as its insular position, its ability to retain control of the sea, its ability to present itself to the world as the defender of the freedoms and rights of small nations and of diverse social and religious groups. Among these numerous causes, there was a financial one and an economic one. Financially, England had discovered the secret of credit. Economically, England had embarked on the Industrial Revolution.

The Fractional Reserve System

"Credit had been known to the Italians and Netherlanders long before it became one of the instruments of English world supremacy. Nevertheless, the founding of the Bank of England by William Paterson and his friends in 1694 is one of the great dates in world history. For generations men had sought to avoid the one drawback of gold, its heaviness, by using pieces of paper to represent specific pieces of gold. Today we call such pieces of paper gold certificates. Such a certificate entitles its bearer to exchange it for its piece of gold on demand, but in view of the convenience of paper, only a small fraction of certificate holders ever did make such demands. It early became clear that gold need be held on hand only to the amount needed to cover the fraction of certificates likely to be presented for payment; according, the rest of the gold could be used for business purposes, or, what amounts to the same thing, a volume of certificates could be issued greater than the volume of gold reserved for payment of demands against them. Such an excess volume of paper claims against reserves we now call bank notes.

The Bankers Were Creating Money Out of Nothing

"In effect, this creation of paper claims greater than the reserves available means that bankers were creating money out of nothing. The same thing could be done in another way, not by note-issuing banks but by deposit banks. Deposit bankers discovered that orders and checks drawn against deposits by depositors and given to third persons were often not cashed by the latter but were deposited to their own accounts. Thus there were no actual movements of funds, and payments were made simply by bookkeeping transactions on the accounts. Accordingly, it was necessary for the banker to keep on hand in actual money (gold, certificates, and notes) no more than the fraction of deposits likely to be drawn upon and cashed; the rest could be used for loans, and if these loans were made by creating a deposit for the borrowers, who in turn would draw checks upon it rather than

withdraw it in money, such 'created deposits' or loans could also be covered adequately by retaining reserves to only a fraction of their value. Such created deposits also were a creation of money out of nothing, although bankers usually refused to express their actions, either note issuing or deposit lending, in these terms.

Bankers Gain Interest on Money Created Out of Nothing

"William Paterson, however, on obtaining the charter of the Bank of England in 1694, to use the moneys he had won in privateering, said, 'The Bank hath benefit of interest on all moneys which it creates out of nothing.' This was repeated by Sir Edward Holden, founder of the Midland Bank, on December 18, 1907, and is, of course, generally admitted today.

Creating Means of Payment Out of Nothing

"This organizational structure for creating means of payment out of nothing, which we call credit, was not invented by England but was developed by her to become one of her chief weapons in the victory over Napoleon in 1815. The emperor, as the last great mercantilist, could not see money in any but concrete terms, and was convinced that his efforts to fight wars on the basis of 'sound money,' by avoiding the creation of credit, would ultimately win him a victory by bankrupting England. He was wrong, although the lesson has had to be relearned by modern financiers in the twentieth century...."*Tragedy and Hope, A History of the World in Our Time*, New York: The Macmillan Company, 1966, pp. 47-49.)

Part III – The Development of Large Banking Dynasties

The former goldsmiths and money lenders lost no time in attaching respectability to their formerly dishonest practices. The practice of "creating money out of nothing" grew rapidly throughout Europe during the 1700s and 1800s. In due time the goldsmiths and their descendants grew into large family banking dynasties called merchant bankers. They became the upper class in various centers of Europe and were especially skilled in financial manipulation at the international level. Quigley states:

"The merchant bankers of London had already at hand in 1810-1850 the Stock Exchange, the Bank of England, and the London money market when the needs of advancing industrialism called all of these into the industrial world which they had hitherto ignored. In time they brought into their financial network the provincial banking centers, organized as commercial banks and savings banks, as well as insurance companies, to form all of these into a single financial system on an international scale which manipulated the quantity and flow of money so that they were able to influence, if not control governments on one side and industries on the other. The men who did this, looking backward toward the period of dynastic monarchy in which they had their own roots, aspired to establish dynasties of

international bankers and were at least as successful at this as were many of the dynastic political rulers.

The House of Rothschild

"The greatest of these dynasties, of course, were the descendants of Meyer Amschel Rothschild (1743-1812) of Frankfort, whose male descendants, for at least two generations, generally married first cousins or even nieces. Rothschild's five sons, established at branches in Vienna, London, Naples, and Paris, as well as Frankfort, cooperated together in ways which other international banking dynasties copied but rarely excelled....

Merchant Bankers Differ from Ordinary Bankers

"The names of some of these banking families are familiar to all of us and should be more so. They include Baring, Lazard, Erlanger, Warburg, Schroder, Seligman, the Speyers, Mirabaud, Mallet, Fould, and above all Rothschild and Morgan. Even after these banking families became fully involved in domestic industry by the emergence of financial capitalism, they remained different from ordinary bankers in distinctive ways: (1) they were cosmopolitan and international; (2) they were close to governments and were particularly concerned with questions of government debts, including foreign government debts, even in areas which seemed, at first glance, poor risks, like Egypt, Persia, Ottoman Turkey, Imperial China, and Latin America; (3) their interests were almost exclusively in bonds, and very rarely in goods, since they admired 'liquidity' and regarded commitments in commodities or even real estate as the first step toward bankruptcy; (4) they were, accordingly, fanatical devotees of deflation (which they called 'sound' money from its close association with high interest rates and high value of money) and of the gold standard, which, in their eyes, symbolized and ensured their values; and (5) they were almost equally devoted to secrecy and the secret use of financial influence on political life. These bankers came to be called 'international bankers' and, more particularly, were known as 'merchant bankers' in England, 'private bankers' in France, and 'investment bankers' in the United States. In all countries they carried on various kinds of banking and exchange activities, but everywhere they were sharply distinguishable from other more obvious, kinds of banks, such as savings banks or commercial banks.

Merchant Bankers Continue Private Firms

"Once of their less obvious characteristics was the they remained as private unincorporated firms, usually partnerships, until relatively recently, offering no shares, no reports, and usually no advertising to the public. This risky status, which deprived them of limited liability, was retained, in most cases, until modern inheritance taxes made it essential to surround such family wealth with the immortality of corporate status for tax-avoidance purposes. This persistence as private firms continued because it ensured the maximum of anonymity and secrecy

to persons of tremendous public power who dreaded public knowledge of their activities as an evil almost as great as inflation.

The System of Influence Which Centered on J. P. Morgan

"As a consequence, ordinary people had no way of knowing the wealth or areas of operations of such firms, and often were somewhat hazy as to their membership. Thus, people of considerable political knowledge might not associate the names Walter Burns, Clinton Dawkins, Edward Grenfell, Willard Straight, Thomas Lamont, Dwight Morrow, Nelson Perkins, Russell Leffingwell, Elihu Root, John W. Davis, John Foster Dulles, and S. Parker Gilbert with the name 'Morgan,' yet all these and many others were parts of the system of influence which centered on the J. P. Morgan office at 23 Wall Street.

J. P. Morgan and Company

"This firm, like others of the international banking fraternity, constantly operated through corporations and governments, yet remained itself an obscure private partnership.... J. P. Morgan and Company, originally founded in London as George Peabody and Company in 1838, was not incorporated until March 21, 1940, and went out of existence as a separate entity on April 24, 1959, when it merged with its most important commercial bank subsidiary, the Guaranty Trust Company. The London affiliate, Morgan Grenfell, was incorporated in 1934, and still exists.

Business and Government Persuaded to Accept Two Axioms of International Banking

"The influence of financial capitalism and of the international bankers who created it was exercised both on business and on governments, but could have done neither if it had not been able to persuade both these to accept two 'axioms' of its own ideology. Both of these were based on the assumption that politicians were too weak and too subject to temporary popular pressures to be trusted with control of the money system; accordingly, the sanctity of all values and the soundness of money must be protected in two ways: by basing the value of money on gold and by allowing bankers to control the supply of money. To do this it was necessary to conceal, or even to mislead, both governments and people about the nature of money and its methods of operation.

The Gold Standard

"For example, bankers called the process of establishing a monetary system on gold 'stabilization,' and implied that this covered, as a single consequence, stabilization of exchanges and stabilization of prices. It really achieved only stabilization of exchanges, while its influence on prices were quite independent and incidental, and might be unstabilizing (from its usual tendency to force prices

downward by limiting the supply of money). As a consequence, many persons, including financiers and even economists, were astonished to discover, in the twentieth century, that the gold standard gave stable exchanges and unstable prices. It had, however, already contributed to a similar, but less extreme, situation in much of the nineteenth century." (Carroll Quigley, *Tragedy and Hope*, pp. 51-53.)

Part IV – The Supply of Money in Each Country

Concerning the operation of the banking system which grew out of England and Europe, Quigley notes:

"In each country the supply of money took the form of an inverted pyramid or cone balanced on its point. In the point was a supply of gold and its equivalent certificates; on the intermediate levels was a much larger supply of notes; and at the top, with an open and expandable upper surface, was an even greater supply of deposits. Each level used the levels below it as its reserves, and, since these lower levels had smaller quantities of money, they were 'sounder.' A holder of claims on the middle or upper level could increase his confidence in his claims on wealth by reducing them to a lower level, although, of course, if everyone, or any considerable number of persons, tried to do this at the same time the volume of reserves would be totally inadequate. Notes were issued by 'banks of emission' or banks of issue,' and were secured by reserves of gold or certificates held in their own coffers or in some central reserve. The fraction of such a note issue held in reserve depended upon custom, banking regulations (including the terms of a bank's charter), or statute law.

The Role of Central Banks

"There were formerly many banks of issue, but this function is now generally restricted to a few or even to a single 'central bank' in each country. Such banks, even central banks, were private institutions, owned by shareholders who profited by their operations. In the 1914–1939 period, in the United States, Federal Reserve Notes were covered by gold certificates to 40 percent of their value, but this was reduced to 25 percent in 1945. The Bank of England, by an Act of 1928, had its notes uncovered up to 250 million, and covered by gold for 100 percent value over that amount. The Bank of France, in the same year, set its note cover at 35 percent. These provisions could always be set aside or changed in an emergency, such as war.

Lodged Deposits and Created Deposits

"Deposits on the upper level of the pyramid were called this name, with typical bankers' ambiguity, in spite of the fact that they consisted of two utterly different kinds of relationships: (1) 'lodged deposits,' which were real claims left by a depositor in a bank, on which the depositor might receive interest, since such deposits were debts owed by the bank to the depositor; and (2) 'created deposits,'

which were claims created by the bank out of nothing as loans from the bank to 'depositors' who had to pay interest on them, since these represented debt from them to the bank. In both cases, of course, checks could be drawn against such deposits to make payments to third parties, which is why both were called by the same name. Both form part of the money supply. Lodged deposits as a form of savings are deflationary, while created deposits, being an addition to the money supply, are inflationary. The volume of the latter depends on a number of factors of which the chief are the rate of interest and the demand for such credit. These two play a very significant role in determining the volume of money in the community, since a large portion of that volume, in an advanced economic community, is made up of checks drawn against deposits.

The Volume of Deposits

"The volume of deposits banks can create, like the amount of notes they can issue, depends upon the volume of reserves available to pay whatever fraction of checks are cashed rather than deposited. These matters may be regulated by laws, by bankers' rules, or simply by local customs. In the United States deposits were traditionally limited to ten times reserves of notes and gold. In Britain it was usually nearer twenty times such reserves. In all countries the demand for and volume of such credit was larger in time of a boom and less in time of a depression. This to a considerable extent explains the inflationary aspect of a depression, the combination helping to form the so-called 'business cycle.'

Central Bank Surrounded by Private Investment Banking Firms

"In the course of the nineteenth century, with the full establishment of the gold standard and of the modern banking system, there grew up around the fluctuating inverted pyramid of the money supply a plethora of financial establishments which came to assume the configurations of a solar system; that is, of a central bank surrounded by satellite financial institutions. In most countries the central bank was surrounded closely by the almost invisible private investment banking firms. These, like the planet Mercury, could hardly be seen in the dazzle emitted by the central bank which they, in fact, often dominated. Yet a close observer could hardly fail to notice the close private associations between these private international bankers and the central bank itself. In France, for example, in 1936 when the Bank of France was reformed its Board of Regents (directors) was still dominated by the names of the families who had originally set it up in 1800; to these had been added a few more recent names, such as Rothschild (added in 1819); in some cases the name might not be readily recognized because it was that of a son-in-law rather than that of a son. Otherwise, in 1914, the names, frequently those of ... Swiss origin (who arrived in the eighteenth century) or of ... German origin (who arrived in the nineteenth century), had been much the same for more than a century.

"In England a somewhat similar situation existed, so that even in the middle of the twentieth century the Members of the Court of the Bank of England were chiefly associates of the various old 'merchant banking' firms such as Baring Brothers, Morgan Grenfell, Lazard Brothers, and others.

The Commercial Banks

"In secondary position, outside the central core, are the commercial banks, called in England the 'joint-stock banks,' and on the Continent frequently known as 'deposit banks.' These include such famous names as Midland Bank, Lloyd's Bank, Barclays Bank in England, the National City Bank in the United States, the Credit Lyonnais in France, and the Darmstadter Bank in Germany.

Institutions That Have Little Financial Power

"Outside this secondary ring is a third, more peripheral, assemblage of institutions that have little financial power but do have the very significant function of mobilizing funds from the public. This includes a wide variety of savings banks, insurance firms, and trust companies.

The Influence of Private Bankers on Industry and Government

"Naturally, these arrangements vary greatly from place to place, especially as the division of banking functions and powers are not the same in all countries. In France and England the private bankers exercised their powers through the central bank and had much more influence on the government and on foreign policy and much less influence on industry, because in these two countries, unlike Germany, Italy, the United States, or Russia, private savings were sufficient to allow much of industry to finance itself without recourse either to bankers or government. In the United States much industry was financed by investment bankers directly, and the power of these both on industry and on government was very great, while the central bank (the New York Federal Reserve Bank) was established late (1913) and became powerful much later.... In Germany industry was financed and controlled by the discount banks, while the central bank was of little power or significance before 1914. In Russia the role of the government was dominant in much of economic life, while in Italy the situation was backward and complicated." (Carroll Quigley, *Tragedy and Hope*, pp. 54-56.)

Part V – The Money Power Dominates Business and Government

Carroll Quigley's commentary on the history of banking should be required reading for the serious student of international affairs. The lengthy text outlines in a fairly readable manner the tremendous interlock of power which the international bankers have developed since 1694. Quigley continued his commentary by stating:

". . . In the various actions which increase or decrease the supply of money, governments, bankers, and industrialists have not always seen eye to eye. On the whole, in the period up to 1931, bankers, especially the Money Power controlled by the international investment bankers, were able to dominate both business and government. They could dominate business, especially in activities and in areas where industry could not finance its own needs for capital, because investment bankers had the ability to supply or refuse to supply such capital. Thus, Rothschild interests came to dominate many of the railroads of Europe, while Morgan dominated at least 26,000 miles of American railroads.

Interlocking Directorates

"Such bankers went further than this. In return for flotations of securities of industry, they took seats on the boards of directors of industrial firms, as they had already done on commercial banks, savings banks, insurance firms, and finance companies. From these lesser institutions they funneled capital to enterprises which yielded control and away from those who resisted. These firms were controlled through interlocking directorships, holding companies, and lesser banks. They engineered amalgamations and generally reduced competition, until by the early twentieth century many activities were so monopolized that they could raise their noncompetitive prices above costs to obtain sufficient profits to become self-financing and were thus able to eliminate the control of bankers. But before that stage was reached a relatively small number of bankers were in positions of immense influence in European and American economic life.

Three Hundred Men Control the Economic Destiny of Europe

"As early as 1909, Walter Rathenau, who was in a position to know (since he had inherited from his father control of the German General Electric Company and held scores of directorships himself), said, 'Three hundred men, all of whom know one another, direct the economic destiny of Europe and choose their successors from among themselves.'

The Power of Investment Bankers over Governments

"The power of investment bankers over governments rests on a number of factors, of which the most significant, perhaps, is the need of governments to issue short-term treasury bills as well as long-term government bonds. Just as businessmen go to commercial banks for current capital advances to smooth over the discrepancies between their irregular and intermittent incomes and their periodic and persistent outgoes (such as monthly rents, annual mortgage payments, and weekly wages), so a government has to go to merchant bankers (or institutions controlled by them) to tide over the shallow places caused by irregular tax receipts. As experts in government bonds, the international bankers not only handled the necessary advances but provided advice to government officials and, on many occasions, placed their own members in official posts for varied periods to deal

with special problems. This is so widely accepted even today that in 1961 a Republican investment banker became Secretary of the Treasury in a Democratic Administration in Washington without significant comment from any direction.

Government Was to Leave the Money Power Supreme and Unquestioned

"Naturally, the influence of bankers over governments during the age of financial capitalism (roughly 1850-1931) was not something about which anyone talked freely, but it has been admitted frequently enough by those on the inside, especially in England. In 1852 Gladstone, chancellor of the Exchequer, declared, 'The hinge of the whole situation was this: the government itself was not to be a substantive power in matters of Finance, but was to leave the Money Power supreme and unquestioned.' On September 26, 1921, *The Financial Times* wrote, 'Half a dozen men at the top of the Big Five Banks could upset the whole fabric of government finance by refraining from renewing Treasury Bills.' In 1924 Sir Drummond Fraser, vice-president of the Institute of Bankers, stated, 'The Governor of the Bank of England must be the autocrat who dictates the terms upon which alone the Government can obtain borrowed money.'

Bankers Steer Governments Through Various Means

"In addition to their power over government based on government financing and personal influence, bankers could steer governments in ways they wished them to go by other pressures. Since most government officials felt ignorant of finance, they sought advice from bankers whom they considered to be experts in the field. The history of the last century shows, as we shall see later, that the advice given to governments by bankers, like the advice they gave to industrialists, was consistently good for bankers, but was often disastrous for governments, businessmen, and the people generally. Such advice could be enforced if necessary by manipulation of exchanges, gold flows, discount rates, and even levels of business activity. Thus Morgan dominated Cleveland's second administration by gold withdrawals, and in 1936-1938 French foreign exchange manipulators paralyzed the Popular Front governments.

International Bankers Dominate International Relations and Other Matters

"As we shall see, the powers of these international bankers reached their peak in the last decade of their supremacy, 1919-1931, when Montagu Norman and J. P. Morgan dominated not only the financial world but international relations and other matters as well. On November 11, 1927, the *Wall Street Journal* called Mr. Norman 'the currency dictator of Europe.' This was admitted by Mr. Norman himself before the Court of the Bank on March 21, 1930, and before the Macmillan Committee of the House of Commons five days later. On one occasion, just before international financial capitalism ran, at full speed, on the rocks which sank it, Mr. Norman is reported to have said, 'I hold the hegemony of the world.' At the time, some Englishmen spoke of 'the second Norman Conquest of England' in reference

to the fact that Norman's brother was head of the British Broadcasting Corporation. It might be added that Governor Norman rarely acted in major world problems without consulting with J. P. Morgan's representatives, and as a consequence he was one of the most widely traveled men of his day. . . . " (Carroll Quigley, *Tragedy and Hope*, pp. 60-61.)

Part VI – The Development of Financial Power in the United States

Concerning the developing of financial power in America, Quigley provides us with the following insights:

"The Founding Fathers had assumed that the political control of the country would be conducted by men of property and leisure who would generally know each other personally and, facing no need for urgent decisions, would move government to action when they agreed and be able to prevent it from acting, without serious damage, when they could not agree. The American Constitution, with its provisions for division of powers and selection of the chief executive by an electoral college, reflected this point of view. So also did the use of the party caucus of legislative assemblies for nomination to public office and the election of senators by the same assemblies. The arrival of a mass democracy after 1830 changed this situation, establishing the use of party conventions for nominations and the use of entrenched political party machines, supported on the patronage of public office, to mobilize sufficient votes to elect their candidates.

Elected Officials Under Pressure from Three Directions

"As a result of this situation, the elected official from 1840 to 1880 found himself under pressure from three directions: from the popular electorate which provided him with the votes necessary for election, from the party machine which provided him with the nomination to run for office as well as the patronage appointments by which he could reward his followers, and from the wealthy economic interests which gave him the money for campaign expenses with, perhaps, a certain surplus for his own pocket. This was a fairly workable system, since the three forces were approximately equal, the advantage, if any, resting with the party machine.

The Forces of Finance and Business Make Large Contributions to Party Political Machines

"This advantage became so great in the period 1865-1880 that the forces of finance, commerce, and industry were forced to contribute ever-increasing largesse to the political machines in order to obtain the services from government which they regarded as their due, services such as higher tariffs, land grants to railroads, better postal services, and mining or timber concessions. The fact that these forces of finance and business were themselves growing in wealth and power made them increasingly restive under the need to make constantly larger contributions to party

political machines. Moreover, these economic tycoons increasingly felt it to be unseemly that they should be unable to issue orders but instead have to negotiate as equals in order to obtain services or favors from party bosses.

The Reason Business Leaders Attacked the Patronage System

"By the late 1870's business leaders determined to make an end to this situation by cutting with one blow the taproot of the system of party machines, namely, the patronage system. This system, which they called by the derogatory term 'spoils system,' was objectionable to big business not so much because it led to dishonesty or inefficiency but because it made the party machines independent of business control by giving them a source of income (campaign contributions from government employees) which was independent of business control. If this source could be cut off or even sensibly reduced, politicians would be much more dependent upon business contributions for campaign expenses. At a time when the growth of a mass press and of the use of chartered trains for political candidates were greatly increasing the expense of campaigning for office, any reduction in campaign contributions from officeholders would inevitably make politicians more subservient to business. It was with this aim in view that civil service reform began in the Federal government with the Pendleton Bill of 1883. As a result, the government was controlled with varying degrees of completeness by the forces of investment banking and heavy industry from 1884 to 1933.

Investment Bankers Wield Enormous Economic, Political, and Social Power

"This period, 1884-1933, was the period of financial capitalism in which investment bankers moving into commercial banking and insurance on one side and into railroading and heavy industry on the other were able to mobilize enormous wealth and wield enormous economic, political, and social power. Popularly known as 'Society,' or the '400,' they lived a life of dazzling splendor. Sailing the ocean in great private yachts or traveling on land by private trains, they moved in a ceremonious round between their spectacular estates and town houses in Palm beach, Long Island, the Berkshires, Newport, and Bar Harbor; assembling from their fortress-like New York residences to attend the Metropolitan Opera under the critical eye of Mrs. Astor; or gathering for business meetings of the highest strategic level in the awesome presence of J. P. Morgan himself.

The Structure of Financial Control Created by the Banking and Business Leaders

"The structure of financial controls created by the tycoons of 'Big Banking' and 'Big Business' in the period 1880-1933 was of extraordinary complexity, one business fief being built on another, both being allied with semi-independent associates, the whole rearing upward into two pinnacles of economic and financial power, of which one, centered in New York, was headed by J. P. Morgan and Company, and the other, in Ohio, was headed by the Rockefeller family. When

these two cooperated, as they generally did, they could influence the economic life of the country to a large degree and could almost control its political life, at least on the Federal level. The former point can be illustrated by a few facts. In the United States the number of billion-dollar corporations rose from one in 1909 (United States Steel, controlled by Morgan) to fifteen in 1930. The share of all corporation assets held by the 200 largest corporations rose from 32 percent in 1909 to 49 percent in 1930 and reached 57 percent in 1939. By 1930 these 200 largest corporations held 49.2 percent of the assets of all 40,000 corporations in the country (\$81 billion out of \$165 billion); they held 38 percent of all business wealth, incorporated or unincorporated (or \$81 billion out of \$212 billion); and they held 22 percent of all the wealth in the country (or \$81 billion out of \$367 billion). In fact, in 1930, one corporation (American Telephone and Telegraph, controlled by Morgan) had greater assets than the total wealth in twenty-one states of the Union.

The Influence of the Morgan and Rockefeller Groups

"The influence of these business leaders was so great that the Morgan and Rockefeller groups acting together, or even Morgan acting alone, could have wrecked the economic system of the country merely by throwing securities on the stock market for sale, and, having precipitated a stock-market panic, could then have brought back the securities they had sold but at a lower price. Naturally, they were not so foolish as to do this, although Morgan came very close to it precipitating the 'panic of 1907,' but they did not hesitate to wreck individual corporations, at the expense of the holders of common stocks, by driving them to bankruptcy. In this way, to take only two examples, Morgan wrecked the New York, New Haven, and Hartford Railroad before 1914 by selling to it, at high prices, the largely valueless securities of myriad New England steamship and trolley lines; and William Rockefeller and his friends wrecked the Chicago, Milwaukee, St. Paul, and Pacific Railroad before 1925 by selling to it, at excessive prices, plans to electrify to the Pacific, copper, electricity, and a worthless branch railroad (the Gary Line).

The Financial Capitalists Exploit an Operating Company

"These are but examples of the discovery by financial capitalists that they made money out of issuing and selling securities rather than out of production, distribution, and consumption of goods and accordingly led them to the point where they discovered that the exploiting of an operating company by excessive issuance of securities or the issuance of bonds rather than equity securities not only was profitable to them but made it possible for them to increase their profits by bankruptcy of the firm, providing fees and commissions of reorganization as well as the opportunity to issue new securities.

Business Interests Control the Republican Party

"When the business interests, led by William C. Whitney, pushed through the first installment of civil service reform in 1883, they expected that they would be able to control both political parties equally. Indeed, some of them intended to contribute to both and to allow an alternation of the two parties in public office in order to conceal their own influence, inhibit any exhibition of independence by politicians, and allow the electorate to believe that they were exercising their own free choice. Such an alternation of the parties on the Federal scene occurred in the period 1880-1896, with business influence (or at least Morgan's influence) as great in Democratic as in Republican administrations. But in 1896, came a shocking experience. The business interests discovered that they could control the Republican Party to a large degree but could not be nearly so confident of controlling the Democratic Party. The reason for this difference lay in the existence of the Solid South as a Democratic section with almost no Republican voters. This section sent delegates to the Republican National Convention as did the rest of the country, but, since these delegates did not represent voters, they came to represent those who were prepared to pay their expenses to the Republican National Convention. In this way these delegates came to represent the business interests of the North, whose money they accepted. Mark Hanna has told us in detail how he spent much of the winter of 1895-1896, in Georgia buying over two hundred delegates for McKinley to the Republican National Convention of 1896. As a result of this system, about a quarter of the votes in a Republican Convention were 'controlled' votes from the Solid South, not representing the electorate. After the split in the Republican Party in 1912, this portion of the delegates was reduced to about 17 percent.

The Inability of the Bankers and Business Leaders to Control the Democratic Convention of 1896

"The inability of the investment bankers and their industrial allies to control the Democratic Convention of 1896 was a result of the agrarian discontent of the period 1868-1896. This discontent in turn was based, largely, on the monetary tactics of the banking oligarchy. The bankers were wedded to the gold standard for reasons we have already explained. Accordingly, at the end of the Civil War, they persuaded the Grant Administration to curb the postwar inflation and go back on the gold standard (crash of 1873 and resumption of specie payments in 1875). This gave bankers a control of the supply of money which they did not hesitate to use for their own purposes, as Morgan ruthlessly pressurized Cleveland in 1893-1896. The bankers' affection for low prices was not shared by the farmer, since each time prices of farm products went down the burden of farmers' debts (especially mortgages) became greater. Moreover, farm prices, being much more competitive than industrial prices, and not protected by a tariff, fell much faster than industrial prices, and farmers could not reduce costs or modify their production plans nearly so rapidly as industrialists could.

Systematic Exploitation of the Agrarian Sectors by the Financial and Industrial Sectors

"The result was a systematic exploitation of the agrarian sectors of the community by the financial and industrial sectors. This exploitation took the form of high industrial prices, high (and discriminatory) railroad rates, high interest charges, low farm prices, and a very low level of farm services by railroads and the government. Unable to resist by economic weapons, the farmers of the West turned to political relief, but were greatly hampered by their reluctance to vote Democratic (because of their memories of the Civil War). Instead, they tried to work on the state political level through local legislation (so-called Granger Laws) and set up third-party movements (like the Greenback Party in 1878 or the Populist Party in 1892).

The Capture of the Democratic Party by the Agrarian Forces

"By 1896, however, agrarian discontent rose so high that it began to overcome the memory of the Democratic role in the Civil War. The capture of the Democratic Party by these forces of discontent under William Jennings Bryan in 1896, who was determined to obtain higher prices by increasing the supply of money on a bimetallic rather than a gold basis, presented the electorate with an election on a social and economic issue for the first time in a generation. Though the forces of high finance and of big business were in a state of panic, by a mighty effort involving large-scale spending they were successful in electing McKinley.

The Financial Power Seeks to Control both Major Political Parties

"The inability of plutocracy to control the Democratic Party as it had demonstrated it could control the Republican Party, made it advisable for them to adopt a one-party outlook on political affairs, although they continued to contribute to some extent to both parties and did not cease their efforts to control both. In fact on two occasions, in 1904 and in 1924, J. P. Morgan was able to sit back with a feeling of satisfaction to watch a presidential election in which the candidates of both parties were in his sphere of influence. In 1924 the Democratic candidate was one of his chief lawyers, while the Republican candidate was the classmate and handpicked choice of his partner, Dwight Morrow. Usually, Morgan had to share this political influence with other sectors of the business oligarchy, especially with the Rockefeller interests (as was done, for example, by dividing the ticket between them in 1900 and in 1920).

America Grew Restless in 1890-1900

"The agrarian discontent, the growth of monopolies, the oppression of labor, and the excesses of Wall Street financiers made the country very restless in the period 1890-1900. All this could have been alleviated merely by increasing the supply of money sufficiently to raise prices somewhat, but the financiers in this

period, just as thirty years later, were determined to defend the gold standard no matter what happened. In looking about for some issue which would distract public discontent from domestic economic issues, what better solution than a crisis in foreign affairs? Cleveland had stumbled upon this alternative, more or less accidentally, in 1895 when he stirred up a controversy with Great Britain over Venezuela. The great opportunity, however, came with the Cuban revolt against Spain in 1895. While the 'yellow press,' led by William Randolph Hearst, roused public opinion, Henry Cabot Lodge and Theodore Roosevelt plotted how they could best get the United States into the fracas. They got the excuse they needed when the American battleship *Maine* was sunk by a mysterious explosion in Havana harbor in February 1898. In two months the United States declared war on Spain to fight for Cuban independence. The resulting victory revealed the United States as a world naval power, established it as an imperialist power with possession of Puerto Rico, Guam, and the Philippines, whetted some appetites for imperialist glory, and covered the transition from the long-drawn age of semidepression to a new period of prosperity. This new period of prosperity was spurred to some extent by the increased demand for industrial products arising from the war, but even more by the new period of rising prices associated with a considerable increase in the world production of gold from South Africa and Alaska after 1895.

America's Entrance Upon the World Stage

"America's entrance upon the state as a world power continued with the annexation of Hawaii in 1898, the intervention in the Boxer uprising in 1900, the seizure of Panama in 1903, the diplomatic intervention in the Russo-Japanese War in 1905, the round-the-world cruise of the American Navy in 1908, the military occupation of Nicaragua in 1912, the opening of the Panama Canal in 1914, and military intervention in Mexico in 1916.

Superficial Concessions by the Wealthy

"During this same period, there appeared a new movement for economic and political reform known as Progressivism. The Progressive movement resulted from a combination of forces, some new and some old. Its foundation rested on the remains of agrarian and labor discontent which had struggled so vainly before 1897. There was also, as a kind of afterthought on the part of successful business leaders, a weakening of acquisitive selfishness and a revival of the older sense of social obligation and idealism. To some extent this feeling was mixed with a realization that the position and privileges of the very wealthy could be preserved better with superficial concessions and increased opportunity for the discontented to blow off steam than from any policy of blind obstructionism on the part of the rich. As an example of the more idealistic impulse we might mention the creation of the various Carnegie foundations to work for universal peace or to extend scholarly work in science and social studies. As an example of the more practical

point of view we might mention the founding of *The New Republic* a 'liberal weekly paper,' by an agent of Morgan financed with Whitney money (1914). Somewhat similar to this last point was the growth of a new 'liberal press,' which found it profitable to print the writings of 'muckrakers,' and thus expose to the public eye the seamy side of Big Business and of human nature itself. But the great opportunity for the Progressive forces arose from a split within Big Business between the older forces of financial capitalism led by Morgan and the new forces of monopoly capitalism organized around the Rockefeller bloc. As a consequence, the Republican Party was split between the followers of Theodore Roosevelt and those of William Howard Taft, so that the combined forces of the liberal East and the agrarian West were able to capture the Presidency under Woodrow Wilson in 1912.

The Unconscious Hypocrisy of Woodrow Wilson

"Wilson roused a good deal of popular enthusiasm with his talk of 'New Freedom' and the rights of the underdog, but his program amounted to little more than an attempt to establish on a Federal basis those reforms which agrarian and labor discontent had been seeking on a state basis for many years. Wilson was by no means a radical (after all, he had been accepting money for his personal income from rich industrialists like Cleveland Dodge and Cyrus Hall McCormick during his professorship at Princeton, and this kind of thing by no means ceased when he entered politics in 1910), and there was a good deal of unconscious hypocrisy in many of his resounding public speeches. Be this as it may, his political and administrative reforms were a good deal more effective than his economic or social reforms. The Clayton Antitrust Act and the Federal Trade Commission Act (1913) were soon tightly wrapped in litigation and futility. On the other hand, the direct election of senators, the establishment of an income tax and of the Federal Reserve System, and the creation of a Federal Farm Loan System (1916) and of rural delivery of mail and parcel post, as well as the first steps toward various laboring enactments, like minimum wages for merchant seamen, restrictions on child labor, and an eight-hour day for railroad workers, justified the support which Progressive had given to Wilson. (Carroll Quigley, *Tragedy and Hope*, pp. 70-76.)

Part VII – The Ultimate Aim of the Powers of Financial Capitalism

Quigley's statements demonstrate the importance of studying money and banking in order to fully understand international affairs. Quigley summarizes the main objectives of the powers of finance capitalism as follows:

"The powers of financial capitalism had another far-reaching aim, nothing less than to create a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole. This system was to be controlled in a feudalist fashion by the central banks of the world acting in concert, by secret agreements arrived at in frequent private meetings and

conferences. The apex of the system was to be the Bank for International Settlements in Basle, Switzerland, a private bank owned and controlled by the world's central banks which were themselves private corporations. Each central bank, in the hands of men like Montagu Norman of the Bank of England, Benjamin Strong of the New York Federal Reserve Bank, Charles Rist of the Bank of France, and Hjalmar Schacht of the Reichsbank, sought to dominate its government by its ability to control Treasury loans, to manipulate foreign exchanges, to influence the level of economic activity in the country, and to influence cooperative politicians by subsequent economic rewards in the business world.

The Role of the Bank for International Settlements

"In each country the power of the central bank rested largely on its control of credit and money supply. In the world as a whole the power of the central bankers rested very largely on their control of loans and of gold flows. In the final days of the system, these central bankers were able to mobilize resources to assist each other through the B.I.S., where payments between central banks could be made by bookkeeping adjustments between the accounts which the central banks of the world kept there. The B.I.S. as a private institution was owned by the seven chief central banks and was operated by the heads of these, who together formed its governing board. Each of these kept a substantial deposit at the B.I.S., and periodically settled payments among themselves (and thus between the major countries of the world) by bookkeeping in order to avoid shipments of gold. They made agreements on all the major financial problems of the world, as well as on many of the economic and political problems, especially in reference to loans, payments, and the economic future of the chief areas of the globe.

The Apex of the Structure of Financial Capitalism

"The B.I.S. is generally regarded as the apex of the structure of financial capitalism whose remote origins go back to the creation of the Bank of England in 1694 and the Bank of France in 1803. As a matter of fact its establishment in 1929 was rather an indication that the centralized world financial system of 1914 was in decline. It was set up rather to remedy the decline of London as the world's financial center by providing a mechanism by which a world with three chief financial centers in London, New York, and Paris could still operate as one. The B.I.S. was a vain effort to cope with the problems arising from the growth of a number of centers. It was intended to be the world cartel of ever-growing national financial powers by assembling the nominal heads of these national financial centers.

The Commander-in-Chief of the World Banking System

"The commander in chief of the world system of banking control was Montagu Norman, Governor of the Bank of England, who was built up by the private

bankers to a position where he was regarded as an oracle in all matters of government and business. In government the power of the Bank of England was a considerable restriction on political action as early as 1819 but an effort to break this power by a modification of the bank's charter in 1844 failed. In 1852, Gladstone, then chancellor of the Exchequer and later prime minister, declared, 'The hinge of the whole situation was this: the government itself was not to be a substantive power in matters of Finance, but was to leave the Money Power supreme and unquestioned.'

The Tremendous Power of the Bank of England

"This power of the Bank of England and of its governor was admitted by most qualified observers. In January, 1924, Reginald McKenna, who had been chancellor of the Exchequer in 1915-1916, as chairman of the board of the Midland Bank told its stockholders: 'I am afraid the ordinary citizen will not like to be told that the banks can, and do, create money. . . . And they who control the credit of the nation direct the policy of Governments and hold in the hollow of their hands the destiny of the people.' In that same year, Sir Drummond Fraser, vice-president of the Institute of Bankers, stated, 'The Governor of the Bank of England must be the autocrat who dictates the terms upon which alone the Government can obtain borrowed money.' On September 26, 1921, *The Financial Times* wrote, 'Half a dozen men at the top of the Big Five Banks could upset the whole fabric of government finance by refraining from renewing Treasury Bills.' Vincent Vickers, who had been a director of the bank for nine years, said, 'Since 1919 the monetary policy of the Government has been the policy of the Bank of England the policy of the Bank of England has been the policy of Mr. Montagu Norman.' On November 11, 1927, the *Wall Street Journal* called Mr. Norman 'the currency dictator of Europe.' This fact was admitted by Mr. Norman himself before the court of the bank on March 21, 1930, and before the Macmillan Committee five days later.

The Position of Montagu Norman

"Montagu Norman's position may be gathered from the fact that his predecessors in the governorship, almost a hundred of them, had served two-year terms, increased rarely, in times of crisis, to three or even four years. But Norman held the position for twenty-four years (1920-1944), during which he became the chief architect of the liquidation of Britain's global preeminence. . . .

Montagu Norman Works in Close Concert With Benjamin Strong

"Norman had a devoted colleague in Benjamin Strong, the first governor of the Federal Reserve Bank of New York. Strong owed his career to the favor of the Morgan Bank, especially of Henry P. Davison, who made his secretary of the Bankers Trust Company of New York (in succession to Thomas W. Lamont) in 1904, used him as Morgan's agent in the banking rearrangements following the

crash of 1907, and made him vice-president of the Bankers Trust (still in succession to Lamont) in 1909. He became governor of the Federal Reserve Bank of New York as the joint nominee of Morgan and of Kuhn, Loeb, and Company in 1914. Two years later, Strong met Norman for the first time, and they at once made an agreement to work in cooperation for the financial practices they both revered.

"These financial practices were explicitly stated many times in the voluminous correspondence between these two men and in many conversations they had, both in their work and at their leisure (they often spent their vacations together for weeks, usually in the south of France).

Forcing the Major Countries to Go on the Gold Standard

"In the 1920's, they were determined to use the financial power of Britain and of the United States to force all the major countries of the world to go on the gold standard and to operate it through central banks free from all political control, with all questions of international finance to be settled by agreements by such central banks without interference from governments.

Central Bankers – Agents and Technicians of the Dominant Investment Bankers

"It must not be felt that these heads of the world's chief central banks were themselves substantive powers in world finance. They were not. Rather, they were the technicians and agents of the dominant investment bankers of their own countries, who had raised them up and were perfectly capable of throwing them down.

The Substantive Financial Powers of the World

"The substantive financial powers of the world were in the hands of these investment bankers (also called 'international' or 'merchant' bankers) who remained largely behind the scenes in their own unincorporated private banks. These formed a system of international cooperation and national dominance which was more private, more powerful, and more secret than that of their agents in the central banks. This dominance of investment bankers was based on their control over the flows of credit and investment funds in their own countries and throughout the world. They could dominate the financial and industrial systems of their own countries by their influence over the flow of current funds through bank loans, the discount rate, and the rediscounting of commercial debts; they could dominate governments by their control over current government loans and the play of the international exchanges.

Men Capable of Bringing Off Successful Financial Coups

"Almost all of this power was exercised by the personal influence and prestige of men who had demonstrated their ability in the past to bring off successful financial coups, to keep their word, to remain cool in a crisis, and to share their winning opportunities with their associates. In this system the Rothschilds had been preeminent during much of the nineteenth century, but, at the end of that century, they were being replaced by J. P. Morgan whose central office was in New York, although it was always operated as if it were in London (where it had, indeed, originated as George Peabody and Company in 1838). Old J. P. Morgan died in 1913, but was succeeded by his son of the same name (who had been trained in the London branch until 1901), while the chief decisions in the firm were increasingly made by Thomas W. Lamont after 1924." (Carroll Quigley, *Tragedy and Hope*, pp. 324-327.)

The preceding quotations by Carroll Quigley outline the development of the international banking system in operation today.

Part VIII – A World System of Financial Control in Private Hands

As one surveys the world of today it appears that the powers of financial capitalism have nearly accomplished their goal to create a "world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole." (Carroll Quigley, *Tragedy and Hope*, p. 324.) Today's international economic system consists of: central banks in every major country, the Bank for International Settlements, the International Monetary Fund, the World Bank, the World Trade Organization, the Organization for economic Cooperation and Development, regular economic summits, the international banking system and the multinational corporate structure.

Undoubtedly the most powerful faction or special interest group in the world is the international banking fraternity – the international bankers, merchant bankers, private bankers and investment bankers. The successful strides of the Houses of Rothschild, Warburg, Morgan, Rockefeller and others, toward global governance, or a world system of financial control in private hands, is a matter of public record. The world today is sitting on the edge of a new era. Many people wonder whether the foundation built by the powers of financial capitalism and a multitude of elite planners is capable of weathering the challenges of the 21st century. Perhaps only time will tell. There is a multitude of challenges, perplexities and problems facing the world of banking. Although many dedicated and intelligent men and women are attempting to steady the bankers' luxury liner, many candid geopolitical observers wonder how long a ship built with questionable tools and materials can stay afloat.

4. International Investment Bankers – Financial Engineering of Corporate Takeovers

Part I – The Financial Core of Monopoly Capitalism

Investment bankers are among the most influential citizens in the world. Clustered in small groups in prominent cities such as New York, Boston, London, Frankfurt, Paris, Tokyo, etc., these men wield more power than kings, presidents, prime ministers and government officials. They control the economies of not only the Western World but the entire world. Their daily decisions affect every person on the earth. A great deal of mystique and secrecy surround these very private bankers, no doubt due to the tremendous amount of power and influence which they command. Their long-range goal, which is shared by their elite partners (the international bankers and corporate directors) is to create "a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole." (Carroll Quigley, *Tragedy and Hope*, p. 324.) T. A. Wise pointed out the tremendous power accumulated by investment bankers as follows:

"The hard financial core of capitalism in the free world is composed of not more than sixty firms, partnerships, and corporations, owned or controlled by some 1,000 men. These men head investment-banking houses in New York City, merchant-banking ventures in London, banques d'affaires in Paris, and similar institutions in Belgium, the Netherlands, Italy, Germany, Sweden, and Australia. Among them they raise, directly or indirectly, an estimated 75 percent of the \$40 billion in fresh capital needed each year to fuel the long-term growth of the industrialized nations.

"In Paris the important banques d'affaires include the Banque de Paris et des Pays-Bas, Credit Lyonnais, Banque Worms, Banque Rothschild – and Lazard Freres. In London there are perhaps a dozen major merchant bankers, including such leading ones as N. M. Rothschild, Morgan Grenfell, S. G. Warburg – and Lazard Brothers. In New York, two dozen investment bankers dominate the world's largest capital market; they include Morgan Stanley, Lehman Brothers, First Boston Corp. – and Lazard Freres...." (*Fortune*, August 1968, p. 101.)

The Power of the Investment Bankers on Wall Street

Investment bankers are the hub of the financial community in New York, London, Paris, etc. In the United States, Wall Street stands pre-eminent among the financial centers of the world.

Concerning the impact of investment bankers on Wall Street, *Newsweek* magazine noted:

"Standing in the visitors' gallery above the teeming floor of the New York Stock Exchange this week, or watching a clacking ticker in Cedar Rapids, even the dullest observer might imagine the stock market as the throbbing heart of the whole U.S. economy. Yet, in fact, it is more like the pulse than the heart – measuring a flow of billions from investor to investor, which does little in itself to strengthen business. The give and take of trading is not an economic heart for the simple reason that it pumps no blood.

"The real pumping is done in another part of Wall Street, in the offices of some 100 investment bankers whose job is to underwrite and sell new securities. They know where the real money can be found in the endless swirl of paper values that runs through the markets from bank vault to bank vault: they know how to put it to work setting bricks in place and creating jobs for millions. The investment banker diverts billions of dollars – some \$20 billion last year in corporate securities, another \$7.1 billion in municipal bonds – from the paper chain into plants, machinery, inventory, working capital, and other solid assets for business and the U.S. economy. It is through the investment banker that Wall Street exerts its real impact on the economy. He stands at the head of the Street, and everything else on the Street is in a real sense an adjunct and a support for his essential job...." (*Newsweek*, October 23, 1961, p. 82.)

A Financial Power Owns the U.S. Government

The power and influence of Wall Street was pointed out by President Franklin D. Roosevelt in a letter dated November 23, 1933, to Colonel Edward Mandell House. Roosevelt said, "[T]he real truth of the matter is, as you and I know, that a financial element in the large centers has owned the government ever since the days of Andrew Jackson...." (*F.D.R.: His Personal Letters*, New York, Duell, Sloan and Pearce, 1950, p. 373.)

Part II – The Wall Street-Washington Complex

Since the days of the First Bank of the United States, bankers and corporate directors have wielded command over the economy and credit of this nation. Today, Wall Street's power and influence is felt in every nation on the earth. One writer, John Thackray, outlined the power which Wall Street has over the U.S. Government. In an article entitled, "The Washington-Wall Street Complex," he said:

"During these times of great concern about the nation's political institutions, the press and the populace at large have expressed growing discontent about the vague, informal concentrations of political power that so often appear to exercise a hold on the workings of our democracy. Whatever the genesis of such concentrations, they seem to have a number of characteristics in common: They are in part invisible, they are self-perpetuating and they deal in a kind of power that never was mentioned in the Constitution. Some of these entities are quite real, such as the

Military-Industrial Complex to which President Dwight Eisenhower gave name, while others are probably more illusory...

Interaction Between Financial Powers and the U.S. Government

"What about the financial community? There has long been a kind of interaction between the wielding of financial power and the administration of our government's policies. But how pervasive is it? To find out *Institutional Investor* researched the Washington-Wall Street Complex, as we've christened it, and discovered that it is much larger and much broader than many people might have suspected. The 167 names listed include a wide variety of people, ranging from former regulators who have shifted over to the side of those they once regulated, to well-known leaders in the Street, who have never actually worked in Washington – yet who by virtue of their fund-raising abilities and connections exercise considerable clout. Most Complex members have served the U.S. government or its agencies to one extent or another. And although they form a unique type of 'old boy' network..., and some members are supremely unaware of belonging to any such Complex, even if they are touched by it all the time.

Members of the Wall Street-Washington Complex Bound Together by a Common Set of Understandings

"To describe the Complex, it is first necessary to realize that its members are bound together by a common set of understandings, of similar claims to insight and knowledge, not the least of which involve the workings of the legislative process. The majority, as we said, have served the Federal government, in posts ranging from high Cabinet levels to legal jobs, say, at the Securities and Exchange Commission. Now they work in the Street in positions of varying influence – sometimes in the most tangential of consulting assignments.... There are a number of men in Washington right now – earning their spurs for a return to the Complex, as most traditionally do. Yet if there is a single unifying force in all this, it is that such involvement with government and politics can change a man, in terms of who he is, who he thinks he is, his perceptions of how the world works – as well as his access to the corridors of power. He is, and many of those who have worked in Washington stress this point, different from others who lack this experience....

"The Complex expanded considerably in the mid-1960s. Investment houses, faced with ever more demanding regulation and compliance issues of the period, turned increasingly to SEC staffers for help. They soon found that some of the most savage regulators could be quickly tamed, and their talents and knowledge of the laws could be exploited. In 1965, for instance, John Cione, nicknamed 'The Enforcer,' for his toughness at the SEC's Northern Regional Office, became the legal bulldog at what is now Blyth Eastman Dillon. In later years, more SECers followed his trail.

"A lot of people from the SEC's Division of Trading and Markets have gone into firms compliance work, because compliance questions became a bigger problem, and the regulations more complicated,' explains Fred Siesel, assistant to the chairman at Weeden & Co., and himself a former SEC economic analyst. It goes without saying, of course, that Wall Street had something else going for them: the ability to pay more than the government does.

"Simultaneously, member firms became more concerned about what was happening on the Washington legislative front, as well as more worried about impending forced changes in the industry's structure. Likewise, for the past five years, the SEC has been more deeply involved than ever before in trying to fathom – and unravel – the economics of the securities business. For this reason, it is said, William Casey, as chairman of the Commission, actively sought more industry personnel to work there. Whether it is a comment on this – or on the health of the business at large – a source within the SEC reports that even now there are more applications from industry men pending than the Commission can accept.

The Sub-Fraternity

"Not surprisingly, then, former SEC staffers comprise the most prominent sub-fraternity within the Complex. That includes not only enforces by investigators as well: many members of the 1963 Special Study team, for instance, have also switched sides. And some of them 'like to keep in touch with one another, in case there is an emergency and we need to call for help,' says Bertram C. Singer, a former SEC trial attorney who is now vice president and general counsel with Cantor, Fitzgerald. Indeed, in Los Angeles, where Singer is stationed, there is an informal lunch club, called the Roundtable, whose members are former SECers now active in the securities business.

"While the Complex is pitted with all kinds of informal groupings and clusters, based on anything from old friendships to new concerns, there are different shadings and colorings to the power wielded. In fact, even though the SEC is the biggest supplier of Complex members – a total of 72, according to our investigations – some of these people, as Wall Streeters, don't carry appreciable power or influence. On the other hand, within the investment banking business, the World Bank seems to be a favorite stamping ground for Complex recruits. No fewer than three Morgan Stanley partners have served there. It is worthy of note that in the past twenty years, Morgan Stanley has also been the manager or co-manager of some \$3.2 billion worth of World Bank underwritings.

The Exercise of Power in Washington

"Needless to say, a certain glamour and sex-appeal attaches itself to those who have once exercised Washington power. Kuhn, Loeb, for instance, has more members of the Complex than anyone else, our reporting shows, followed closely by A.G. Becker, First Boston, Goldman Sachs and Lehman Brothers. It's likely, in

fact, that the number of Complex members is only exceeded by the number of those who'd like to join – under the right circumstances. It is not uncommon on Wall Street for a man to float a rumor about an imminent transfer to the halls of Washington, as a way of inflating what might be a flagging reputation, or simply bidding for an appointment.

"In Washington, on the other hand, many are only too aware that the clock is running out on their government jobs and are already preparing for the day when they will desert their posts – to join for the first time, or to return to, the securities industry. There is, in fact, a rather sharp contradiction here. While many civil servants have dedicated themselves to the relatively low-paying, but rewarding, life of public service, others view their Washington jobs as a short-term way of enhancing their value on the job market. 'The SEC,' says one current SEC staffer who intends to move back to the Street before long 'is the best post-graduate business course there is in the investment industry.'

Stars of the Wall Street Firms

"To be sure, there are some people who have entered the Complex only to pull out again hastily. One noteworthy example is Lawrence O'Brien, politician and former chairman of the Democratic National Committee, who served a brief hitch as president of the ill-fated McDonnell & Co. Then, too, some of the illustrious Complex members who have been successful and who have stayed in positions of influence in the Street haven't always performed as well as might have been hoped. For instance, George Ball, former Undersecretary of State, was supposed to do great things for Lehman in the international area – yet Lehman's international business, so far at least, hasn't exactly bloomed under his direction. In addition, it might seem that Secretary of the Treasury is about as bright a star as can be found in the Washington constellations. Yet former Treasurer chief Henry Fowler, who is not a partner at Goldman, Sachs, has not, hints one senior partner, produced all the new investment banking business that could have been expected. Still, both men have added considerable luster to their firms.

The Real Power Base of Wall Street

"Wall Street is not without its opposition to the Complex. This most often takes the form of a grudging resentment toward the incursions made by famous Washington names into the Wall Street job and reputation market – in concert with the feeling that the real business of the Street is performed by inside men, trained and schooled in the industry for decades, and not some glamorous former Undersecretary or Assistant Secretary who might not even understand the jargon of the Street and whose function is, at least in part, to be a showcase for his and his firm's image.

One of the Most Illustrious Members of the Complex

"Still, public relations has to be considered as inherent in the game. After all, the typical Complex representative seems almost compulsively to capitalize on his personal intimacy with Washington's workings – be it specific knowledge or knowledge of who knows what. One of the most illustrious members of the Complex these days is Peter G. Peterson, chairman of Lehman Brothers, and former Secretary of Commerce in the Nixon Administration. When he was in Washington, Peterson was a close friend to – and political ally of – Henry Kissinger. And today, Peterson's business conversation and speeches are laced with enough references to and stories about what Kissinger did and said to tax the patience of even the most devoted collector of political trivia.

"On the other hand, there can be misfires, even on the public relations front. Some years ago, Charles Plohn, the new issues king, was attracting considerable attention at the SEC. Plohn hired Edward C. Jaegerman, a man with a 25-year-old SEC reputation as a tough and honest investigator. But this did not save Plohn from further SEC criticisms. Eventually Plohn failed, and Jaegerman was indicted, acquitted, and left the securities business. In another context, Maurice Stans, former Secretary of Commerce, who was once a member of the Complex as head of Glore Forgan, was recently acquitted in the Vesco case.

A Wide Diversity of Members Comprise the Complex

"In any event, the Washington-Wall Street Complex, as defined by *Institutional Investor*, today has a wide diversity of members, with differing ranks and status. Our research effort, headed up by Assistant Editor Janice Holling, has collected the names and credentials presented in the accompanying table. And our method was to ask the most visible former Washingtonians about themselves and others of whom they know. These, in turn, were tracked down and interviewed, the same questions being asked of them, and so on. Admittedly, the procedure isn't foolproof and some omissions are inevitable. In addition, some sources declined to cooperate with our reporters. And since a subsequent article on this issue deals with the so-called Washington 'listening posts,' we have here included only the heads of those organizations owned or most intimately associated with brokerage firms. Other deliberate omissions range from the case of Secretary of State Henry Kissinger, who in the past has served as a consultant to Mitchell, Hutchins, and such links as the fact that the daughter of Paine, Webber chief James Davant is married to the son of Colorado Senator Peter Dominick.

Members of the Wall Street-Washington Complex

"For the records, then, the classifications are our own, and they can be characterized as follows:

Dress Circle. At the top of the heap is a tiny handful of Wall Streeters who have never really worked in Washington – except to serve on occasional blue-ribbon commissions – yet who seem to wield power whichever political party is in office. The reason is that they are tops among the Street's political fund-raisers and they have a lot of markers in Washington, which they can call.

Superstars. The glamour that attaches itself to high-level political jobs isn't lost on the Street's former Cabinet-level officers, Under-secretaries of the various Cabinet-level departments and other luminaries often hold their standing when they switch.

Stars. Some men of slightly lesser magnitude than the Washington Superstars – including former Assistant Secretaries and those who served in other key, but non-Cabinet-level, positions – have made it big in the Street.

Gentlemen Callers. While most members of the Complex have fairly impressive calling cards, some are more equal than others. These include some grand old men who long stalked the corridors of power and now have relatively tangential relationships to the Street – as well as policy makers in fields like economics, who now have at least part-time consulting jobs.

Trainees. Wall Street continuously provides fresh recruits for government service, even during times such as these, when public scrutiny of politics and politicians can cause less-than-happy experiences. When Wall Streeters are working in Washington, they can be considered in training for a position in the Complex – since they so often return to work in the financial community.

Round-Trippers. Nothing is immutable, however; not even in the complex. A number of members have returned to work in Washington for a second time.

Handymen. Throughout the financial world there is a sprinkling of former Congressional aides – and people who undertook similar assignments in Washington – who have now crossed over into the Complex and have found a home within it.

Former Cops. Since the SEC is the watchdog of the securities industry, many SEC staffers grow up as policemen and investigators. They're usually lawyers, and they more than earn their pay by knowing what is permissible, what is not permissible – and what might be.

Technocrats. A lot of power is not the power to get things done, but to find out what is happening, or who is making it happen. Accurate, up-to-date information about a Washington matter is often a very scarce commodity – and the individuals who can develop it for firms as well as self-regulatory agencies are extremely valuable to have around.

"What, then, does it all add up to? How much real political power does the Washington-Wall Street Complex actually exercise?"

An Important and Pervasive Force

"... [I]t's clear that something is in place here, something that amounts to an important and pervasive force. It is a force with many arms and many faces – some very powerful, others not necessarily so powerful. Yet its sheer size makes the Washington-Wall Street Complex something to watch in the years ahead – for big as it is, it is likely to get a lot bigger." (*Institutional Investor*, May, 1974, pp. 58-59, 63.)

Part III – Services Provided by Investment Bankers

The article by Thackray only touched the tip of the iceberg, nevertheless, it did document the existence of a Wall Street-Washington Complex which "is much larger and much broader than many people might have suspected." Their influence on government policies over the last twelve decades is staggering.

Besides influencing government policies, goals and legislation to achieve their long-range goals, investment bankers provide a wide range of services to its clients – investors and corporations. Some of the financing services of investment bankers include:

- Corporation underwritings

- Private placements

- Lease financings

- Mergers, acquisitions and divestitures

- Real estate financings and sales

- International public offerings

- International private placements

- Domestic and international project financings

- Industrial revenue bond and pollution control financings

- Commercial paper issuance

- Corporate stock repurchasing

- Registered and non-registered secondary offerings

Underwritten redemption of securities

Sinking fund purchases

Investments for temporary excess cash

Exchange offerings and tender offers

Hedging in financial futures

Government agency financings

State and municipal financings

Financing services for foreign governments and agencies

Financial advisory and evaluation services

The Investing services of the bankers include:

Investment research

Economic forecasting

Money market and bond market analysis

Investment strategy

Block trading

Special order service

Equity securities, listed and over-the-counter

Foreign securities trading

Convertible stocks and bonds

Domestic and international securities arbitrage

Listed options trading

Debt and equity securities swaps

Restricted brokerage transactions

Commercial paper

Government and Federal agency securities

Bankers acceptances

Certificates of deposit

Corporate bonds, notes and preferred stocks

Mortgage-backed securities

Tax-exempt bonds

Securities from managed offerings and participations

Part IV – A Brief Look at an Investment Banking House

In order to understand the services which investment bankers provide and the role they play in the world of international finance, it is necessary to take a brief look inside one of the more prominent investment houses. I have chosen Lazard Freres & Company, however, inasmuch as they provide almost identical services, I could have chosen Morgan Stanley, First Boston Corporation or Goldman Sachs. The following document describes the activities, a brief history, and the services of Lazard Freres & Company in New York City:

Introduction to Lazard Freres

"The investment banking activities of Lazard Freres & Company involve concentration on a select group of important corporate clients. This Firm seeks to focus its strengths on a banking relationship where the opportunity is present for making a material contribution to the success of the client's enterprise. The unique nature of Lazard Freres – the knowledge, relationships, and creativity of its people – makes it ideally suited to serve as investment banker for such companies.

A Worldwide Network of Relationships

"Lazard Freres is a relatively small, closely-knit organization distinguished by its abilities to develop new domestic or international financing techniques when acting as financial advisor to corporate and governmental clients. The Firm's reputation as a creator and executor of major financial transactions rests upon its intimate knowledge of U.S. domestic and international capital markets, its worldwide network of relationships and the accumulated experience and talent of the personnel upon whom it is able to draw. Historically, Lazard Freres has been willing to commit its own capital in venture or turnaround situations which gives the firm a background of operating and industrial experience unavailable to most

of its competitors. A number of its active partners have had business operating and management careers in addition to their experience as investment bankers.

Financial Engineering

"Lazard Freres is involved in a wide range of activities for its corporate clients including domestic and international corporate finance, underwritings, private placements, mergers and acquisitions, project finance, lease financing, and real estate development and finance. It is also an important factor in municipal finance, venture capital and money management. The Firm is proud of its record for quality service and its accomplishments in financial "engineering" in difficult and complex transactions.

"Lazard Freres maintains an institutional bond and stock distribution capability designed to conduct brokerage, trading and securities placement relationships with the top 200 institutions in the nation and, through its affiliated firms in the United Kingdom and France, with the major institutions internationally. This capability enables the firm to provide corporate clients with timely capital market judgements and efficient execution independently from any need to meet overheads or generate trading and distribution profits.

History of Lazard Freres

"Lazard Freres and Company was founded in New Orleans in 1848 and is among the oldest banking partnerships in the United States. Since then, the Firm, now based in New York, has become a leading U.S. investment bank. Subsequent to the formation of Lazard Freres & Company, the associated but independent firms of Lazard Freres et Cie. in Paris and Lazard Brothers & Company, Limited in London were founded. All three firms cooperate closely with each other in order to provide their multinational group of clients with financial services on a global basis. One or the other of the three Lazard banks is a member of the major U.S. stock exchange, the Paris Bourse and has associations in Zurich, Rome, Singapore, Hong Kong, Tokyo and Seoul. Recently, Lazard Brothers & Company, Limited has invested capital as a limited partner in Lazard Freres & Company. The senior partner of both Lazard Freres & Company and Lazard Freres et Cie. is Michel David-Weill who succeeded Andre Meyer in New York at the end of 1977.

Financial Advisor to Key Corporations

"Historically, Lazard Freres has acted as financial advisor in the development of many major corporations, with partners of the Firm working closely with the top management to devise corporate strategy, financial planning and acquisition philosophy, and to execute financings and acquisitions. Over the years and continuing today, Lazard Freres has advised such corporations as ITT, RCA, Allied Chemical, Corning Glass, Englehard Minerals, Newmont Mining, Owens-Illinois, General Dynamics, Pfizer, Allis-Chalmers, among others.

"The Firm has demonstrated especially its expertise in advising large corporations and governments during periods of difficulty. At crucial times, Lazard Freres has acted as financial advisor to Lockheed, Allis-Chalmers, Eastern Airlines, Boise Cascade and Chrysler, as well as Indonesia and New York City, providing material assistance and unconventional solutions.

Handling of Private Placements

"The Firm has been called in to handle two of the largest private placements in recent years, both of which equaled or exceeded \$500 million – one to finance the construction of a petro-chemical facility at Corpus Christi, Texas for a joint venture consisting of Union Pacific, ICI and Solvay Company; the other, to finance the acquisition of Peabody Coal.

Serving a Select Group of Clients

"Lazard Freres concentrates its efforts on servicing a select group of corporate, governmental and municipal clients. In order to maintain this focus it has eschewed expansion into retail brokerage or dealing in common stocks as a principal. Through its specialized sales and trading operation, the Firm maintains daily contact with the major investing institutions and money centers in the U.S. and, through its international associations, abroad.

"Lazard Freres sells and maintains positions in corporate and municipal bonds. The firm sells and trades equity securities and is a member of the New York Stock Exchange. The Firm has an important Equity Research Department which was created to service its money management effort, but which is able to render valuable advice to the firm's corporate clients. The firm is an active manager of and participant in negotiated and competitive corporate and municipal issues, and forms and runs syndicates to distribute the securities. The Firm is thus able to provide its clients with sound judgement on price and timing of issues. It has also been able to identify major low cost opportunities in the private market as they occur.

"As a manager of corporate and municipal issues, the firm has a syndicate department which solicits indications of interest from major institutional purchasers, underwriters and dealers. The Firm has consistently sold in excess of its underwriting position in debt issues in which it has acted as manager or co-manager This has also been true in the case of equity issues where there was a strong institutional interest. In cases where strong retail interest is indicated, the firm has recommended certain co-managers with strong retail distribution capabilities.

Purchase of Major Holdings in Other Corporations

"Among the related services which the firm is able to provide for its corporate clients and their managements are execution services in listed securities. The Firm performs sales of 'restricted' stock under Rules 133, 144 and 145, shelf registrations and the purchase of a client's own common stock in the market and from known large holders. As an adjunct to its merger and acquisition activity, the firm is able to purchase in the market major holdings in other corporations on behalf of its clients. In conjunction with these activities, the firm conducts appraisals and valuations for tax, stock options and other purposes.

Attracting New Clients

"In recent years, Lazard Freres has been successful in attracting a number of clients who are new to the firm. In many cases, the loyalties of these new clients has been cemented by the execution of an assignment in which the firm has been able to add considerable value because of its creativity and expertise. Recently, companies like Reliance Electric, Studebaker-Worthington, United Technologies, Norton Simon and the Continental Group have decided to involve Lazard Freres in their corporate finance business. The Firm is also working with a number of clients in the extractive industries including Ashland Oil and Kennecott.

Mergers and Acquisitions

"Lazard Freres is particularly known for its activities and successes in corporate acquisitions and tender offers.... It has negotiated numerous major acquisitions for corporations and investors both in the United States and abroad.

"In addition to transactions in which Lazard Freres has represented the acquiror, the Firm has also represented the seller in a number of significant transactions, and has often been called upon to render advice to corporations wishing to dispose of a division or redeploy its assets through sale or joint venture. The Firm has a great deal of experience in providing its opinion on the fairness of the financial terms of a proposed corporate transaction.

Extensive Expertise in Contested Transactions

"Numerous companies have sought the firm's advice when anticipating or confronted by an unsolicited tender offer. Our extensive expertise in contested transactions makes us particularly competent to advise companies in planning defense strategies against tenders.

"The Firm has wide experience in mergers and associated advisory services for life and casualty insurance companies and allied financial services companies and currently has a number of assignments of this nature. The Firm advised ITT in its acquisition of Hartford Fire Insurance and in its subsequent disposition of ITT

Hamilton Life and ITT Life of New York. The Firm also advised Continental Group in its acquisition of Richmond Corporation. It advised Ticor in connection with the acquisition of Constellation Reinsurance, and is currently providing advice in connection with its acquisition of Southern Pacific Company. The Firm represented AMIC during the negotiations with Merrill Lynch and Mutuelles Unies in its tender offer for shares of Appalachian National.

International Multi-Source Finance

"Internationally, the Firm has raised funds for numerous agencies and organizations in Europe, Latin America and Asia. The European Coal & Steel Community, the European Investment Bank and the Inter-American Development Bank have frequently sought funds in U.S. financial markets through its efforts, and the Central-American Bank for Economic Integration, the Private Investment Corporation of Asia, the Ivory Coast Development Bank and the Industrial Mining and Development Bank of Iran have utilized the Firm's resources to raise needed capital.

The Associated Firms of Lazard Brothers and Lazard Freres

"The associated firms of Lazard Brothers Limited and Lazard Freres et Cie. have broad experience with European and other international currency markets and the three firms together are able to advise on alternative financing opportunities in all markets. Lazard Freres has managed euro-bond financings for many U.S. corporations including Owens-Illinois, Nabisco, RCA, ITT, Monsanto, Corning Glass, Revlon and AMF.

"Lazard Freres has been a leader in developing instruments to assist emerging nations in achieving the necessary finance for infrastructure and natural resource development. The Firm has maintained a significant role in the development of such entities as the Ivory Coast Development Bank and the Private Investment Company of Asia. The Firm currently advises the governments of Indonesia, Turkey and Bagon in financial matters.

Project and Joint Venture Finance

"Because financing availability and cost are a critical element in the accomplishment of a major project, a financial advisor such as Lazard Freres is often engaged to assist in the design and structure of the financial and legal arrangements. The Firm's personnel have considerable experience in providing such advice to corporate and governmental clients all over the world. A good example of such a project was the Pipeline Sud European for which the financing was arranged jointly by Lazard Freres & Co. and Lazard Freres et Cie. The firms introduced the concept of throughout financing for oil pipelines in Europe.

Creative Financial Planning

"In many situations, Lazard Freres has been involved when innovative approaches are required. This has enabled the Firm to nurture its capability for creative financial planning. One example of this was the divestiture of Peabody Coal by Kennecott and its acquisition by a joint venture. In another transaction, the Firm was approached in 1977 by Champlin Petroleum Company, a subsidiary of Union Pacific, for the purpose of finding a suitable partner to exploit existing petroleum reserves. The Firm developed the idea of the formation of a joint venture between Champlin, The Solvay Company of Belgium and ICI to share a petro-chemical facility in Corpus Christi, Texas and assisted in the implementation of the project and the arrangement of the \$500 million private placement in the U.S. on behalf of the joint venture, which, like the Peabody placement, was one of the largest project private placements ever arranged. Lazard Freres made the transaction possible by bringing the partners together through its knowledge and understanding of their business needs and qualifications. The transaction typifies the Firm's ability to draw on many areas of expertise in order to create value for its clients.

"Lazard has recently become financial advisor to three major domestic energy projects, the \$12 billion Northwest Alaska Gas Project, the \$1.5 billion ETSI Coal Slurry Pipeline Project, and Southern Natural Resources.

Handling of Complex Negotiations

"All three Lazard houses have been involved in a wide variety of such projects in addition to those mentioned above. The Firm has acted as advisor on the sale of major oil and gas properties to Ashland Oil Corporation, Mobil Oil, ITT and others. It handled complex negotiations leading to the merger of Atlantic Richfield and the Sinclair Oil Company, as well as in a transaction by which Hess Oil Company acquired ownership of Amerada Corporation, a company launched by associates of Lazard Brothers & Company, Limited.

Advice to International Insurance Companies

"In addition to the advice to U.S. based insurance companies described above, the Firm through its associated firms Lazard Brothers and Lazard Freres et Cie. have close relationships with a number of major insurance companies around the world. Directors of Lazard Brothers hold the position of Chairman or Deputy Chairman of Friendly Provident Life, Royal Insurance and Sun Life, and have board representation at Legal and General, Sun Alliance and, until recently, Commercial Union and Phoenix. Lazard Freres et Cie. has a direct ownership in La France and Assicurazioni Generali." (Brochure, Lazard Freres, New York City, no date.)

Part V – America's Top Corporations and Their Investment Bankers

As the previous descriptive material on Lazard Freres demonstrates, investment bankers service the global and domestic corporations in a variety of ways. The following list includes several of the major companies and their investment banker: Etna Life Casualty – Morgan Stanley; American Airlines – Goldman Sachs; American Express – Salomon Brothers; AMF – Lazard Freres; Archer-Daniels-Midland – Salomon Brothers; Black & Decker – Lehman Brothers Kuhn Loeb; Borden – Morgan Stanley; Carter Hawley Hale Stores – Morgan Stanley; Chrysler – Lazard Freres and First Boston; Colgate-Palmolive – Dillon Read; DuPont (E. I. de Nemours – Morgan Stanley; Ford Motor Co., – Goldman Sachs; General Foods – Goldman Sachs; Goodrich (B.F.) – Goldman Sachs; Gulf Oil – First Boston; IT&T – Lazard Freres & Lehman Brothers Kuhn Loeb; Johns Manville – Goldman Sachs; Kennecott Cooper – First Boston; Motorola – Goldman Sachs; Penzoil – Lehman Brothers Kuhn Loeb; Quaker Oats – Goldman Sachs & Lazard Freres; Shell Oil – Morgan Stanley; Standard Oil of Calif. – Blythe Eastman Dillon & Solomon Brothers; Texaco – Morgan Stanley; Time – Salomon Brothers; UAL – Morgan Stanley; United Brands – Goldman Sachs; Weyerhaeuser – Morgan Stanley. (*Institutional Investor*, April 1979, pp. 49-62.)

The ranking of the leading investment firms and the number of their clients in 1979 was: Goldman Sachs (127); Merrill Lynch White Weld (122); Lehman Brothers Kuhn Loeb (85); First Boston (78); Morgan Stanley (70); Salomon Brothers (59); Kidder Peabody (51); Blyth Eastman Dillon (51); Smith Barney, Harris Upham (38); Lazard Freres (36). (Ibid)

Part VI – Andre Meyer: One of the Most Famous Investment Bankers

One of the most important investment bankers in the world was Andre Meyer, the former senior partner of Lazard Freres & Co. in New York, who died in 1979. T. A. Wise describes some of the activities and influence of this financial wizard as follows:

"Andre Meyer [was] a sixty-nine-year-old investment banker who was born in France, left there in 1940 only a step ahead of the German Gestapo, and became a U.S. citizen in 1948. Meyer's official title is senior partner of Lazard Freres & Co. In New York. But he also has a large number of official and unofficial relationships that give him a distinctive role in the power politics of finance. He is, for example, the only U.S. investment banker who is a partner or director of major investment-banking houses in Europe and other parts of the world. Meyer not only serves on the boards of such large U.S. corporations as RCA and Allied Chemical, but is a member of the Fiat and Montecatini Edison boards in Italy and the Sofina board in Belgium.

Meyer's Connections in High Places

"Meyer's connections in high places have won him a string of delicate public assignments. As a youth in the Twenties, he represented French bankers negotiating the Young Plan. In 1963, President Kennedy appointed him to the Fowler Committee, set up to develop ways of promoting foreign investment in the U.S. and foreign financing of U.S. corporations abroad. More recently, President Johnson named him to the Dillon Committee, which played a major role in the creation of the IMF's Special Drawing Rights. Meyer is credited with being one of the first men to urge a two-tier system of pricing gold.

"Meyer's close friends include Robert McNamara, the new president of the World Bank, and Henry Fowler, Secretary of the Treasury. He is a confidant of Eugene Black, former head of the World Bank who is now a financial adviser to the U.S. and the U.N. (Black's son is a Lazard partner.) And his contacts with other internationally known financial figures are old and deep. Jean Monnet, the father of the Common Market, and Jacques Reuff, de Gaulle's key adviser on monetary policy, are old friends. Reuff's father, a doctor, delivered Meyer at birth. Maurice Couve de Murville, France's new Premier, is a friend of thirty years' standing.

An Impressive Network of Influential Acquaintances

"Indeed, Meyer has built such an impressive network of influential acquaintances that Dale Carnegie could have taken lessons from him. He is not only a personal friend and adviser to Jacqueline Kennedy but is also a trustee of Joseph Kennedy's substantial estate. Lyndon Johnson consults him regularly. And he is a joint investor with David Rockefeller in several real-estate ventures.

The Single Most Intriguing Figure in the World

"Meyer's formidable combination of talent, experience, and personal contacts prompts many sophisticated financial people in the U.S. and abroad to concede that he is the single most intriguing and influential figure...operating in the capital markets of the free world. To many people who deal with him he appeared to be a tough, aggressive, and imaginative banker who knows precisely what he wants and is determined to get it. A fellow corporate board member calls him "the de Gaulle of the financial world." Extremely publicity-shy, he insists that all negotiations in which he is involved be kept strictly confidential. A few years ago, when word leaked prematurely that a major oil company was considering buying Avis, which Meyer then controlled, he immediately broke off discussions. 'We don't want to deal with people who cannot control their information,' he snapped. (*Fortune*, August 1968, pp. 102-103.)

Part VII – Mergers and Acquisitions

Meyer's righthand man at Lazard Freres was Felix G. Rohatyn. Rohatyn is one of Wall Street's most respected "merger and acquisition" kings. One way in which a "world system of financial control in private hands" is being built is through mergers and acquisitions. Most mergers and acquisitions are arranged by investment bankers. The end result of these various mergers over the years is the giant multinational corporations. In essence, global companies are created by the elite triangle of power in the world – the international bankers, investment bankers and corporate directors. Each of these individuals sit on each others' board of directors to the degree that it seems like one large world corporation, although legally they are separate global entities. For example, in 1973 Lazard Freres' general partners were directors in thirty-one corporations. The same pattern exists for the other investment banking houses, as well as the giant corporations and banks.

A Web of Interlocking Directorates

A virtual web of interlocking directorates bind the corporations, international banks and investment houses together. It is this web of influence which constitutes the "elite financial and industrial establishment" of the United States. Similar "establishments" exists in London, Paris, Geneva, Brussels, Frankfurt, Tokyo, etc. The elites from these areas are also bound together in a tightly knitted web of interdependence. The combination of elites in New York, Boston, Paris, London, Tokyo, Frankfurt, etc., is what constitutes the world power structure. It is a very real, visible identity. The long-range goal of this elite power structure is a "world system of financial control in private hands."

The World Power Structure

The real world power structure is like concentric circles. The central core probably consists of less than one hundred powerful financial, industrial, and corporate figures. The second circle probably consists of a group of 500-900 elite bankers, industrialists, businessmen, etc. The third circle probably consists of another 5000 elites who uphold and promote the system throughout the world. To this writer, the elite power structure of the world resembles a giant global corporation with a chairman of the board, a board of directors, numerous presidents and vice-presidents, etc. However, such a corporation does not exist, at least not yet. These influential and powerful individuals are the architects of the "new Imperial System."

Giant World Monopolies Are Being Built

If one looks at the world today there exists about five hundred major global companies. These companies through the process of merger and acquisition are slowly swallowing up the businesses and corporations of this world. The process

of building giant world monopolies is being accomplished and orchestrated by the investment banking world. It is called "financial engineering" and entails the arranging of mergers and acquisitions and the selling of financial advice. In fact, the arrangement of mergers and acquisitions is the most profitable aspect of investment banking.

The Concentration of Power in Our Society

On June 20, 1979, John H. Shenefield, Assistant Attorney-General, Anti-trust Division of the United States Department of Justice, forwarded to the President and Congress a report entitled, "Conglomerate Mergers, Small Business, and the Scope of Existing Anti-Merger Statutes." The report stated:

Introduction

"Over the past decade, a broad spectrum of public officials, members of the academic and business communities, and the public at large has expressed increasing concern about the cumulative effect of large conglomerate mergers on the concentration of economic power in our society and about the long-range impact of such mergers on competition and on the ability of small businesses to function effectively.

"The purpose of this report is to evaluate these concerns in the context of the current ability of the antitrust agencies to deal effectively with the problems raised by mergers, particularly conglomerate mergers, among America's largest businesses.

Large Merger Waves

"We believe that this review is a timely one. The United States has experienced several large merger waves within the last century. The first major merger wave, viewed by some as an effort to create monopolies, resulted in the passage of the Sherman Act of 1890 and the Clayton Act of 1914. The next merger wave, which has been characterized as an effort to create oligopolies by merger, led, in part, to the enactment of the Celler-Kefauver Act of 1950, which strengthened Clayton Act Section 7. As the merger waves of the late 1960's and early 1970's developed, it became clear to antitrust experts that the existing antitrust laws which had proved relatively effective against horizontal and vertical mergers were of only limited applicability to conglomerate consolidations.

The First Merger Wave

"While the first conglomerate merger wave caused widespread public debate, no additional antitrust legislation directed at conglomerate mergers was enacted by Congress at that time, partially out of a belief that conglomerate mergers, previously a relatively unstudied phenomenon, might have overall positive benefits

on economic activity. When that merger wave drew to a close, immediate public interest in conglomerate mergers diminished. Subsequently, however, analyses of the effects, both positive and negative, of conglomerates became increasingly available as the data from that period, compiled from financial reports and government statistics, was subjected to scrutiny by researchers.

A New Merger Wave

"With the recent emergence of a new conglomerate merger wave, the stage was therefore set for a renewed public debate concerning the need for additional legislation to deal with merger among the largest business enterprises. The small business community has been an active participant in this dialogue.

"A poll taken among the 570,000 members of the National Federation of Independent Business during early 1979 revealed that 61 percent of those responding believed that mergers by and among the largest firms should not be permitted unless proponents of such an acquisition could demonstrate that it was not anticompetitive or monopolistic. Similarly, a 1978 report of the House Committee on Small Business, *Future of Small Business in America*, concluded that the antitrust enforcement agencies should develop proposals to reverse the trend increasing aggregate concentration through mergers and acquisitions.

"It is to a discussion of conglomerate mergers – their effects and the ability of the antitrust laws to deal with them – that this report now turns.

The Conglomerate Merger Phenomenon

"The Current conglomerate Merger Wave – Its Effect on Economic Concentration"

"During the past few years, the number of reported mergers, especially the number of mergers involving the largest American corporations, has increased sharply. Between 1975 and 1978 the number of 'giant mergers,' those involving the acquisition of companies in transactions valued at \$100 million or more, leaped from 14 to 80, a 500 percent gain. Overall, in that same period, the annual total purchase value for all announced mergers rose nearly 190 percent. Today's merger activity is significantly above historical averages in both absolute and relative terms, and rivals the 1968-1969 merger peaks in intensity.

"The principal type of merger consummated in this wave is conglomerate. In recent years, mergers involving companies engaged in businesses totally unrelated to each other, so-called 'pure conglomerate mergers,' have accounted for between 45 and 55 percent of all manufacturing assets acquired in large mergers; the percentage interest is between 80 and 90 percent of manufacturing assets transferred when the other categories of conglomerate mergers, product and market extension mergers, are included.

A Long Term Trend Toward Increasing Concentrations of Power

"This merger activity is taking place in any economy which is experiencing a long-term trend toward an increasing concentration of economic power. In 1950, when Congress strengthened the Clayton Act, legislators expressed concern that 'industrial giants' were gaining too much economic power, and that this 'rising tide economic concentration' threatened local control of business and other non-economic values. Then, Congress noted that the 316 largest industrial firms had increased their share of the manufacturing sector's working capital from 40 percent in 1929 to 47 percent in 1940. Between 1947 and 1972, however, the largest 200 American industrial firms increased their share of the nation's manufacturing assets from 46 to 61 percent. During the current merger wave, the trend has continued. By 1977 these top 200 firms controlled 62 percent of the industrial assets.

High Levels of Concentration

"Data recently made available by the Internal Revenue Service also reveals that relatively high levels of concentration exist economy-wide and that they have been increasing, or not declining significantly, in several sectors. For example, the percent of total corporate assets from all sectors of the economy attributable to the 50 largest companies grew from 20.8 percent in 1968 to 23.1 percent in 1974, and the share of the largest 500 corporations rose from 45.9 percent to 48.6 percent. In terms of total receipts during those years, the share of the top 50 went from 15.5 percent to 19.2 percent, and of the top 500, from 35.2 percent to 40.6 percent. Excluding financial, insurance, and real estate corporations, the share of the top 50's assets increased from 25.1 percent to 25.7 percent, and that of the top 500, from 53.9 percent to 55.6 percent. For receipts, the numbers were, top 50, 16.6 percent to 20.9 percent; top 500, 36.5 percent to 42.2 percent.

"Mergers have played a significant part, though only a part, in this growth. Studies estimate that as much as 73 percent of the increase in concentration of assets held by the largest 200 manufacturing companies during the 1950's and 1960's was directly attributable to assets acquired in mergers. Approximately 13.6 percent of the assets held by the top 200 industrial companies in 1977 were obtained by mergers. At least one study estimates that but for mergers by the 200 largest industrial companies, the overall concentration of assets held by our country's largest firms would have declined in the 1960's.

"In similar fashion, conglomerate mergers by large firms have served to diminish the number of decision centers in the business community. For example, from 1968 through 1977, corporations with more than \$1 billion in assets acquired 160 independent industrial enterprises having assets over \$10 million by means of conglomerate mergers.

The Cumulative Effects of Large Conglomerate Mergers May Be Substantial

"Although conglomerate mergers among large enterprises may, on average, have relatively few net economic benefits or detriments for the firms involved, the cumulative impact of conglomerate mergers on society may be significant. The next section of this report will detail those effects as they specifically relate to small business; this section will summarize the effect of conglomerate acquisitions on society as a whole.

Concentration of Power into Fewer and Fewer Corporations

"Perhaps the most overt effect of mergers and acquisitions among America's largest businesses is the contribution they make toward the increasing concentration of economic power in relatively fewer and fewer corporations. One of the fundamental principles underlying our society's approach toward economic organization, repeatedly articulated by Congress and the courts in developing antitrust policy, is the encouragement of a diversity of voices and a decentralization of economic power. Large business organizations, however, are seen by some as inherently at odds with these basic precepts of a democratic society: because they employ many individuals, and purchase and produce much of our nation's economic output, large enterprises may have undue influence on the political affairs of the nation.

Large Corporations Are in a Position to Encourage Favors From Public Officials

"With a broad community of interests dependent on their financial well-being, the largest corporations are in a position to encourage a favorable response from public officials. Similarly, because of their ability to marshal both economic resources and the time of employees, large firms may be in a position to have a disproportionate voice in the shaping of the political debate over various issues of public importance. This latter role of the corporation in American society was recently brought home by the Supreme Court's decision in *First National Bank of Boston v. Bellotti*, which upheld the right of business enterprises to spend funds without government restriction to advocate positions on a wide variety of issues.

An Undercutting of Basic American Values

"Thus, to the extent that conglomerate mergers decrease the number of independent decision centers in the business community without enhancing productivity, they contribute to a needless undercutting of basic American values. In addition, conglomerate mergers cumulatively may cause economic and competitive harms as well.

"First, conglomerate mergers may divert corporate financial resources or loan capacity from investment in new productive facilities. Instead of taking the

relatively risky, but societally beneficial, step of creating new capacity for the production of goods and services, firms may take the expedient step of 'growth by acquisition,' a process that simply serves to transfer wealth from the purchasing corporation (and its shareholders) to the shareholders of the target enterprise. Moreover, when banks lend funds to finance a takeover, resources available for internal expansion by businesses, including small business, are diminished. Where this process involves a 'hostile' takeover, additional investable funds may be dissipated in the form of payments to lawyers and public relations agencies as the suitor and target firm battle it out in every forum except that of the market place. Indeed, it is estimated that one recent highly contested acquisition cost upwards of \$15 million in direct outlays. Needless to say, corporate efficiency can only suffer as the attention of senior managers is diverted from the normal process of running a business so they can participate in the battle for control of the target firm.

The Effect of Mergers

"The cumulative effect of conglomerate mergers may do more than merely decrease investment in new productive facilities; it may decrease competition throughout the economy as firms choose to buy a 'presence' in an attractive market by acquisition of an existing firm, rather than through creation of a new competitor. As long as companies continue to have the opportunity to diversify through acquisition, including acquisition of relatively dominant firms, they cannot be faulted for avoiding the more competitive means of diversification, *de novo* entry or purchase of a firm with a relatively small market share.

"Finally, conglomerate mergers facilitate the emergence of 'mutual forbearance' on the part of major firms. As firms increasingly operate in markets common to each other, they can develop a community of interests which discourages aggressive competition. For example, a firm with a competitive advantage in one market may forego exercising that advantage because a competitor in that market is a conglomerate operating also in another market in which the first firm is competitively weak. The firm may fear that to compete in the first market will invite retaliation in the second, imposing costs counterbalancing any expected gains in the first. The likelihood of the emergence of this 'live and let live' philosophy may be enhanced where these overlaps occur in concentrated markets in which the conglomerates involved control leading firms.

The Effects of Conglomerate Mergers on Small Businesses

"This section explores the effects of conglomeration on small business. Acquisition of a firm by a large corporation may have a variety of effects on small business. It can affect small business in the markets in which the acquired firm operates, the acquired firm's relationships to its small business suppliers and customers, and the acquired firm's relationship with the community in which it

functions. Additionally, even if individual mergers do not produce a significant impact, the effect of many mergers, taken together, may be significant.

"At the outset it should be noted that, as a direct consequence of disproportionately large growth by large corporations, the share of productive wealth held by small business has declined. In 1960, small and medium size corporations controlled 50 percent of the nation's manufacturing assets. Notwithstanding a substantial increase in the number of small business firms, by 1976 the relevant share dwindled to 30 percent. This decline is not just the product of natural forces encouraging accelerated growth by large firms. Artificial barriers seemingly restrain small business growth. Thus, in examining the effects of conglomerate mergers upon small business, it is important to note the ways in which conglomerate mergers may exacerbate those problems which small businesses believe hamper their development.

Competitive Effects on Markets in Which the Conglomerate Operates

"The chief threat to small business rivals resulting from the acquisition of a competitor by a large enterprise is that the transaction will 'entrench' the competitor's market position or enable the acquired firm to 'invest' in short-run predatory conduct for the purpose of achieving the benefits of a dominant position thereafter. Moreover, the purchase of a firm by a multiline conglomerate may enhance the firm's opportunity to use business reciprocity, tie-in sales, or predatory pricing tactics to gain unwarranted sales and profits at the expense of smaller rivals. A conglomerate merger which may enlarge a disparity in financial resources between a conglomerate firm and its market rivals may also create a fear that the newly enriched competitor may use its resources to retaliate against any company instituting a price move, and thus, either discourage smaller rivals from aggressively competing or encourage them to obtain a similar resource by seeking out a comparably sized merger partner, further accelerating the loss of small businesses.

The Threat of Anticompetitive Entrenchment

"The threat of anticompetitive entrenchment is especially great when a conglomerate firm acquires a dominant or near-dominant firm in a concentrated industry. In some cases the conglomerate may be able to transfer its economic power to a new line of commerce. It may be able to use earnings derived in other markets to subsidize its operations in the new market, or vice-versa, to enable it to sell its products at a substantial reduction in price and profits to gain an increase in its market share at the expense of firms which are unable to adopt similar pricing strategies because they lack a second income stream to support production at reduced profit levels. This possibility particularly affects the one-market small business.

"Some conglomerate firms have extensively and intensively advertised products which are obtained in a merger. This advertising may increase the sale of the product at the expense of firms, especially small firms, which lack the financial wherewithal to mount such marketing campaigns. While there is not a consensus on this matter, some economists believe that this advertising is anticompetitive in that it creates a barrier to the growth or entry of competitors. If large scale advertising is, as other economists suggest, a proper form of competition in distribution, the adverse effects on small business that may result cannot theoretically be considered 'anticompetitive.' Nevertheless, it would appear that, to the extent that the only 'advantage' derived from a conglomerate acquisition of a leading firm is an increased advertising budget, the transaction may injure small businesses without significant benefits to the public.

Effects on Customers and Suppliers of a Conglomerate

"While an alteration in an acquired corporation's operational practices does not always ensue following its acquisition by a conglomerate, changes in marketing strategies, pricing practices and credit extension policies have sometimes followed a merger. These operational modifications may disrupt long established business relationships. Small business firms are particularly affected by such changes, since many of these firms are engaged in the distributional process and must purchase products from these acquired manufacturers for resale at the wholesale or retail level.

"Of particular concern to small business may be the conglomerate establishment of a centralized purchasing system. The conglomerate may attempt to consolidate its buying power by having all supplies purchased at a central location. It may choose to eliminate existing arrangements with local small business in favor of acquiring goods from a larger company. The consolidation of purchasing power may or may not represent a savings to the firm, but it often creates severe losses for the affected small businesses.

"Small firms are especially vulnerable to the adverse consequences of changes in existing business practices, since even transitory costs generated by such changes can cause severe cash flow difficulties and disproportionately affect the small business firm's often small profit.

Effects on the Conglomerate's Community

"A conglomerate merger may decrease the commitment of an acquired firm to the financial and civic health of its local community. When corporate decision-making power is transferred and consolidated in distant cities, local interests and needs may become increasingly less relevant to corporate management. Local service industries may, in particular, find their business diminished when the corporation chooses to rely on businesses in the cities where its headquarters are located to fulfill the financial, legal, accounting and other needs of the business.

"Additionally, because a large corporation often determines the fate of a particular plant by reference to broad corporate goals, it may close an acquired plant for not achieving these goals, though the business remains viable. Whereas a locally oriented enterprise might make a special effort to seek improved methods of operation to allow it to remain in business and thus preserve the jobs of local managers and employees, the large corporation may believe that its management talent and available funds might more readily be invested elsewhere in its conglomerate structure and simply shut the business down.

"A plant closure directly affects those small businesses that dealt with the plant directly. Additionally, a plant closure may affect the economic vitality of a community, which may affect small businesses through a 'ripple' effect.

Effect of Government Regulation on Small Business

"Small business persons believe that much of the current governmental regulation handicaps their firms' performance. The cost of providing information required by regulators is relatively fixed: regardless of the size of a firm queried, a substantially equivalent effort may be required to answer most government questionnaires. This means the proportionate cost of conforming to regulatory informational demands is inversely related to the size of the responding firm. Moreover, small firms are often unable to hire regulatory specialists to monitor, communicate with, or challenge regulatory authorities, and thus must suffer the consequences of an increased cost for last-second compliance with regulations. Larger enterprises thus gain a substantial, if artificial, competitive advantage where regulation exists.

The Growth of Government Regulations

"Regulatory involvement is growing. The number of rules promulgated by agencies, as recorded in the Federal Register, has increased substantially. The conglomerate merger wave may contribute to this growth. While many government regulatory programs represent much-needed efforts to protect the public health and safety, many citizens also appear to believe, however reluctantly, that 'big government' is a necessary countervailing power to 'big business.' Consequently, calls for government regulation over and above that which might be required is a more decentralized, more competitive economy, may receive the support of legislators. To the extent that conglomerate mergers contribute to this perceived need for countervailing governmental intervention, the continued occurrence of such mergers will likely lead to further regulation. Ironically, of course, such regulation may impose relatively greater costs on small business, creating further difficulties for their efforts to prosper.

The Prospect for Control of Conglomerate Mergers Under Existing Antitrust Laws

"The principal legal constraint on mergers, Section 7 of the Clayton Act, has, for a number of reasons, proved an unsatisfactory tool for controlling conglomerate mergers. Its ineffectiveness is best illustrated by the fact that since 1973, in a period of heightened conglomerate merger activity, there has not been a successfully litigated conglomerate merger challenge; both the Antitrust Division and the Federal Trade Commission have lost approximately twelve merger cases based on conglomerate theories from 1973 through 1978.

"The chief defect of present law is its narrow focus on anticompetitive effects in particular markets. Judicial decisions in the early 1960's made clear that the statute can effectively scrutinize horizontal or vertical mergers because those mergers have a direct potential for lessening competition in a given line of commerce. However, conglomerate mergers, for the most part, have escaped enforcement efforts because they often do not pose immediate competitive threats to a given market. Government attempts to expand the scope of the act by challenging mergers because of their effect on aggregate or *economy-wide* concentration have been rejected.

"Although the courts have accepted certain of the competitive theories advanced by antitrust agencies to attack particular conglomerate mergers, the requisite proof is very difficult.

"For instance in 'actual' potential competition cases the plaintiff may be required to establish that the potential entrant *subjectively* intended alternative entry into the market. Thus, it may not be sufficient to establish the objective fact that alternative means of entry were feasible. Similarly, in cases where it is alleged the acquiring firm was a procompetitive force because it was perceived as a potential entrant, the courts may require evidence that existing competitors actually modified their conduct because of its presence on the fringe of the market. Further, the requirement that a potential entrant be one of only a few such entrants limits the effectiveness of the theory with respect to purely conglomerate mergers.

"Courts have also recognized that a conglomerate merger may entrench a leading firm. The courts, however, have required fairly specific proof of such an entrenching effect before finding a violation of Section 7. Courts have refused to apply the theory where the acquired firm was not dominant in its market or where the argued entrenching effect was not based upon a close complementary relationship between the products sold by the two firms.

"An increased opportunity for anticompetitive reciprocity has been recognized as a possible harmful effect of certain conglomerate mergers. As with the other conglomerate merger theories, the focus is on specific anticompetitive effects in particular economic markets. Thus, the mere possibility of some increased opportunity for reciprocity has not been generally accepted as a basis for prohibiting the typical conglomerate merger.

"Finally, even when particular anticompetitive effects can be demonstrated, the parties to the merger may simply decide to divest a portion of their assets to remedy the specific anticompetitive problem, often leaving them free to combine the bulk of their assets.

Possible Legislative Remedies

"On the basis of the evidence developed over the past decade, it is fair to conclude that mergers among this nation's largest business enterprises, particularly those that are conglomerate in nature, on an average contribute little to the enhancement of efficiency, productivity, and competition. At the same time, these transactions, by their very nature, serve to enhance the aggregate concentration of economic power in the hands of fewer and fewer large enterprises while removing from the business community independent voices for innovation, competition, and political expression.

"Most importantly, merger and acquisition activity by the largest businesses carries with it a significant potential for harm to competition in general and to small business in particular. Acquisitions of dominant firms by firms with substantial resources may serve to entrench those firms and to finance predatory behavior that might not otherwise have been possible. Internalization of procurement and supply functions within a conglomerate may eliminate the acquired firm as either a supplier or customer of small businesses, as headquarters officials in a distant city find it administratively convenient to deal directly with a fewer number of larger enterprises. In some instances, where the acquired firm is a major factor in the local economy, the result may be the long-run impairment of the community's business environment." (U. S. Department of Justice, Antitrust Division, Washington, D. C., pp. 1-18.)

Part VIII – Conclusion

From the above report by the Department of Justice, the reader can begin to glimpse the tremendous movement which is currently underway to create giant global monopolies. It should be pointed out that these large corporations are controlled by a few large family empires or individuals. A "world system of financial control in private hands" is not an illusion but is fast becoming a reality. The power of the elite financial oligarchy is growing daily as mergers and acquisitions continue throughout the world. Tremendous power is being concentrated into a few hands. The triangular interlock of international bankers, corporate directors, and investment bankers is successfully steering the business of the world into a system that resembles a giant world corporation. In the near future, one hundred global companies may dominate every major field – banking, business, transportation, communications, industry, chemicals, computers, utilities, etc. These one hundred global corporations and the remaining four hundred large world corporations are so intertwined through the process of interlocking

directorates as to form what resembles a single world corporation with a defined set of ideologies.

The world of the future will be 'managed' by global companies and global institutions. The nation-state will become an 'administrative' unit of the global system of governance operated by the elite financial oligarchy. In the world of the future as well as the world of the past, the investment banker will continue to play a dominant role in the world's elite power structure as financial engineer and manager.

5. The Impact of Wall Street on the World

Part I – Introduction

Since the early 1900s, certain influential and powerful groups of international bankers, investment bankers, and corporate directors have developed a close alliance with leading socialists and communists throughout the world. One prominent scholar who has presented evidence of the East-West interlock or alliance is Antony Sutton, former Research Fellow at the Hoover Institution on War and Peace at Stanford University. While at the Hoover Institution, Sutton published his monumental three-volume series entitled, "Western Technology and Soviet Economic Development 1917-1965." After completing his lengthy treatise on Western assistance to the Soviet Union, Sutton produced four books which subsequently surprised the academic world: *National Suicide: Military Aid to the Soviet Union* (1973); *Wall Street and the Bolshevik Revolution* (1974); *Wall Street and FDR* (1975); and *Wall Street and the Rise of Hitler* (1976).

A Well Documented Study of the Elite Power Structure in America

In a well-documented and scholarly fashion Sutton introduced the reader to fact after fact that certain groups of Wall Street bankers and businessmen had been supporting socialism and communism around the world. Antony Sutton's premise is that international bankers, investment bankers, and corporate directors operate upon monopolistic practices and are determined to use governments to further their control of the earth – its people and resources. A socialist government is based on central economic and political control. It is easier to control a small group of administrators than a nation of sovereign people. The nations which have embraced socialism or communism have been reduced to mere administrative units which operate under the direction and control of the world's power structure – the international bankers, investment bankers, and corporate directors. Socialism eliminates competition in the market arena and produces greater monopoly control. In other words, socialism and communism (which operate from below), coupled with monopoly and finance capitalism (which operate from above) create a "world system of financial control in private hands able to dominate the political system of

each country and the economy of the world as a whole." (Carroll Quigley, *Tragedy and Hope*, The Macmillan Company, NY, 1966, p.324.)

The Earth is Falling Under the Control of Global Corporations

The earth is gradually falling under the control of large global companies and international institutions. The governmental machinery of the nation-states throughout the world is dominated and controlled by the world's elite power structure. These elite groups finance socialism and communism because it reduces people to a situation where they are totally dependent upon the state. The elite power structure controls the government by placing its special emissaries in strategic places within the government, such as Secretary of State, Secretary of Treasury, Secretary of the Commerce, the CIA and National Security Council, the Securities and Exchange Commission, etc. These individuals then introduce and maintain governmental policies which keep the people in bondage and the elite in positions of power.

Professor Sutton is one of the few scholars to see through the maze of deception and propaganda which has been disseminated throughout the world by the elites in the United States, Europe, Asia and elsewhere. In the remainder of this section, we will examine a number of comments made by Professor Sutton which illustrate that a capitalist-socialist-communist alliance is operating from Wall Street.

Part II – Wall Street and the Bolshevik Revolution

Inasmuch as we have already discussed Sutton's research on military and industrial aid to the Soviet Union in the section on multinational corporations, we will concentrate on his three books on Wall Street in this chapter. In this section, we will look at *Wall Street and the Bolshevik Revolution*, published in 1974. In chapter one, Professor Sutton briefly outlines the monopolistic goals of the inner sanctums of Wall Street. He then explains why so many academics have been duped into believing that capitalists and communists are enemies. He stated:

"Consequently, one barrier to mature understanding of recent history is the notion that all capitalists are the bitter and unswerving enemies of all Marxists and socialists. This erroneous idea originated with Karl Marx and was undoubtedly useful to his purposes. In fact, alliance between international political capitalists and international revolutionary socialists is to their mutual benefit. This alliance has gone unobserved largely because historians – with a few notable exceptions – have an unconscious Marxian bias and are thus locked into the impossibility of any such alliance existing. The open-minded reader should bear two clues in mind: monopoly capitalists are the bitter enemies of laissez-faire entrepreneurs; and, given the weaknesses of socialist central planning, the totalitarian socialist state is a perfect captive market for monopoly capitalists, if an alliance can be made with the socialist power-brokers. Suppose – and it is only hypothesis at this point – that American monopoly capitalists were able to reduce a planned socialist Russia to

the status of a captive technical colony? Would not this be the logical twentieth-century internationalist extension of the Morgan monopolies and the Rockefeller petroleum trust of the late nineteenth century? (Antony C. Sutton, *Wall Street and the Bolshevik Revolution*, New Rochelle, NY: Arlington House, 1974, p. 17.)

International Financiers Support Communism

It is obvious that the world is being propelled or guided into a global system of central economic and political planning under international institutions such as the IMF, IBRD, OECD, BIS, WTO, economic summitry, etc. This could not occur if the people of the world had not been pre-conditioned into accepting the communist and socialist philosophy. Professor Sutton in *Wall Street and the Bolshevik Revolution* provides sufficient evidence to conclude that without the assistance of the certain international financiers and businessmen, communism would have never flourished in the Soviet Union and, later, in China. In fact, had these totalitarian powers been curtailed by freedom fighters, it is possible that today Russia, China, East Europe and parts of Asia would be free nations with prosperity equal to that of the United States.

International Financiers are Responsible for the Survival of Communism

The harsh facts indicate that elites in the United States and Europe are responsible not only for the birth but the survival of communism since the Bolshevik Revolution. Professor Sutton provided the reader with the following synopsis of the material he presented in his book:

"Evidence already published by George Katkov, Stefan Possony, and Michael Futrell has established that the return to Russia of Lenin and his party of exiled Bolsheviks, followed a few weeks later by a party of Mensheviks, was financed and organized by the German government. The necessary funds were transferred in part through the Nya Banken in Stockholm, owned by Olof Aschberg, and the dual German objectives were: (1) removal of Russia from the war, and (b) control of the postwar Russia market.

Working Relationship between Morgan Guaranty Trust Company and Bolsheviks

"We have now gone beyond this evidence to establish a continuing working relationship between Bolshevik banker Olof Aschberg and the Morgan-controlled Guaranty Trust Company in New York before, during, and after the Russian Revolution. In tsarist times Aschberg was the Morgan agent in Russia and negotiator for Russian loans in the United States; during 1917 Aschberg was financial intermediary for the revolutionaries; and after the revolution Aschberg became head of Ruskombank, the first Soviet international bank, while Max May, a vice president of the Morgan-controlled Guaranty Trust, became director and chief of the Ruskombank foreign department. We have presented documentary

evidence of a continuing working relationship between the Guaranty Trust Company and the Bolsheviks.

Transfer of Funds from Wall Street to Revolutionaries

"Moreover, there is evidence of transfers of funds from Wall Street bankers to international revolutionary activities. For example, there is the statement (substantiated by a cablegram) by William Boyce Thompson – a director of the Federal Reserve Bank of New York, a large stockholder in the Rockefeller-controlled Chase Bank, and a financial associate of the Guggenheims and the Morgan – that he (Thompson) contributed \$1 million to the Bolshevik Revolution for propaganda purposes. Another example is John Reed, the American member of the Third International executive committee who was financed and supported by Eugene Boissevain, a private New York banker, and who was employed by Harry Payne Whitney's *Metropolitan* magazine. Whitney was at that time a director of Guaranty Trust. We also established that Ludwig Martens, the first Soviet 'ambassador' to the United States, was (according to British Intelligence chief Sir Basil Thompson) backed by funds from Guaranty Trust Company. In tracing Trotsky's funding in the U.S. we arrived at German courses, yet to be identified, in New York. And though we do not know the precise German sources of Trotsky's funds, we *do* know that Von Pavenstedt, the chief German espionage paymaster in the U.S., was also senior partner of Amsinck & Co. Amsinck was owned by the ever-present American International Corporation – also controlled by the J. P. Morgan firm.

"Further, Wall Street firms including Guaranty Trust were involved with Carranza's and Villa's wartime revolutionary activities in Mexico. We also identified documentary evidence concerning a Wall Street syndicate's financing of the 1912 Sun Yat-sen revolution in China, a revolution that is today hailed by the Chinese Communists as the precursor of Mao's revolution in China. Charles B. Hill, New York attorney negotiating with Sun Yat-sen in behalf of this syndicate, was a director of three Westinghouse subsidiaries, and we have found that Charles R. Crane of Westinghouse in Russia was involved in the Russian Revolution.

Significant Evidence of Wall Street's Involvement in Bolshevik Revolution

"Quite apart from finance, we identified other, and possibly more significant, evidence of Wall Street involvement in the Bolshevik cause. The American Red Cross Mission to Russia was a private venture of William B. Thompson, who publicly proffered partisan support to the Bolsheviks. British War Cabinet papers now available record that British policy was diverted towards the Lenin-Trotsky regime by the personal intervention of Thompson with Lloyd George in December 1917. We have reproduced statements by director Thompson and deputy chairman William Lawrence Saunders, both of the Federal Reserve Bank of New York, strongly favoring the Bolsheviks. John Reed not only was financed from Wall

Street, but had consistent support for his activities, even to the extent of intervention with the State Department from William Franklin Sands, executive secretary of American International Corporation. In the sedition case of Robert Minor there are strong indications and some circumstantial evidence that Colonel Edward House intervened to have Minor released. The significance of the Minor case is that William B. Thompson's program for Bolshevik revolution in Germany was the very program Minor was implementing when arrested in Germany.

International Agents

"Some international agents, for example Alexander Gumberg, worked for Wall Street and the Bolsheviks. In 1917 Gumberg was the representative of a U.S. firm in Petrograd, worked for Thompson's American Red Cross Mission, became chief Bolshevik agent in Scandinavia until he was deported from Norway, then became confidential assistant to Reeve Schley of Chase Bank in New York and later to Floyd Odlum of Atlas Corporation.

"This activity in behalf of the Bolsheviks originated in large part from a single address: 120 Broadway, New York City. The evidence for this observation is outlined but no conclusive reason is given for the unusual concentration of activity at a single address, except to state that it appears to be the foreign counterpart of Carroll Quigley's claim that J. P. Morgan infiltrated the domestic left. Morgan also infiltrated the international left.

The American International Corporation

"The Federal Reserve Bank of New York was at 120 Broadway. The vehicle for this pro-Bolshevik activity was American International Corporation – at 120 Broadway. AIC views on the Bolshevik regime was requested by Secretary of State Robert Lansing only a few weeks after the revolution began, and Sands, executive secretary of AIC, could barely restrain his enthusiasm for the Bolshevik cause. Ludwig Martens, the Soviet's first ambassador, had been vice president of Weinberg & Posner, which was also located at 120 Broadway. Guaranty Trust Company was next door at 140 Broadway but Guaranty Securities Co. was at 120 Broadway. In 1917 Hunt, Hill & L. Betts was at 120 Broadway, and Charles B. Hill of this firm was the negotiator in the Sun Yat-sen dealings. John MacGregor Grant co., which was financed by Olof Aschberg in Sweden and Guaranty Trust in the United States, and which was on the Military Intelligence black list, was at 120 Broadway. The Guggenheims and the executive heart of General Electric (also interested in American International) were at 120 Broadway. We find it therefore hardly surprising that the Bankers club was also at 120 Broadway, on the top floor (the thirty-fourth).

American-Russian Syndicate Formed in 1918

"It is significant that support for the Bolsheviks did not cease with consolidation of the revolution; therefore, this support cannot be wholly explained in terms of the war with Germany. The American-Russian syndicate formed in 1918 to obtain concessions in Russia was backed by the White, Guggenheim, and Sinclair interests. Directors of companies controlled by these three financiers included Thomas W. Lamont (Guaranty Trust), William Boyce Thompson (Federal Reserve Bank), and John Reed's employer Harry Payne Whitney (Guaranty Trust). This strongly suggests that the syndicate was formed to cash in on earlier support for the Bolshevik cause in the revolutionary period. And then we found that Guaranty Trust financially backed the Soviet Bureau in New York in 1919.

Soviets Form Their First International Bank

"The first really concrete signal that previous political and financial support was paying off came in 1923 when the Soviets formed their first international bank, Ruskombank. Morgan associate Olof Aschberg became nominal head of this Soviet bank; Max May, a vice president of Guaranty Trust, became a director of Ruskombank, and the Ruskombank promptly appointed Guaranty Trust Company its U.S. agent." (Antony C. Sutton, *Wall Street and the Bolshevik Revolution*, pp. 169-172.)

Alliance Between Morgan Interests and Bolsheviks

The above synopsis of Sutton's work detailed an extensive and close alliance between Morgan interests and the revolutionaries in the Soviet Union. It also demonstrates that certain individuals in Europe were party to the rise of communism in the Soviet Union. We are not talking about a small group of over-zealous revolutionaries. We are talking about the involvement of the most powerful bankers in America – those connected with J. P. Morgan's empire. At this time, the Morgan group was the undisputed ruler of Wall Street. Professor Sutton next outlines his views on why the capitalist-communist alliance was created:

"What motive explains this coalition of capitalists and Bolsheviks: Russia was then – and is today – the largest untapped market in the world. Moreover, Russia, then and now, constituted the greatest potential competitive threat to American industrial and financial supremacy. (A glance at a world map is sufficient to spotlight the geographical difference between the vast land mass of Russia and the smaller United States.) Wall Street must have cold shivers when it visualizes Russia as a second super American industrial giant.

Wall Street Financiers Enlarge Their Monopolistic Ambitions

"But why allow Russia to become a competitor and a challenge to U.S. supremacy? In the late nineteenth century, Morgan, Rockefeller, and Guggenheim

had demonstrated their monopolistic proclivities. In *Railroads and Regulation 1877-1916* Gabriel Kolko has demonstrated how the railroad owners, not the farmers, wanted state control of railroads, in order to preserve their monopoly and abolish competition. So the simplest explanation of our evidence is that a syndicate of Wall Street financiers enlarged their monopoly ambitions and broadened horizons on a global scale. *The gigantic Russian market was to be converted into a captive market and a technical colony to be exploited by a few high-powered American financiers and the corporations under their control.* What the Interstate Commerce commission and the Federal Trade Commission under the thumb of American industry could achieve for that industry at home, a planned socialist government could achieve for it abroad – given suitable support and inducements from Wall Street and Washington, D.C.

The Bolshevik Revolution Was an Alliance of Statists

"Finally, lest this explanation seem too radical, remember that it was Trotsky who appointed tsarist generals to consolidate the Red Army; that it was Trotsky who appealed for American officers to control revolutionary Russia and intervene in behalf of the Soviets; that it was Trotsky who squashed first the libertarian element in the Russian Revolution and then the workers and peasants; and that recorded history *totally* ignores the 700,000-man Green Army composed of ex-Bolsheviks, angered at betrayal of the revolution, who fought the Whites *and* the Reds. In other words, we are suggesting that the Bolshevik Revolution was an alliance of statists: statist revolutionaries and statist financiers aligned against the genuine revolutionary libertarian elements in Russia.

The Real Motivation of the Bankers on Wall Street

"The question now in the readers' minds must be, were these bankers also secret Bolsheviks? No, of course not. The financiers were without ideology. It would be a gross misinterpretation to assume that assistance for the Bolsheviks was ideologically motivated, in any narrow sense. The financiers were *power*-motivated and therefore assisted *any* political vehicle that would give them an entree to power: Trotsky, Lenin, the tsar, Kolchak, Denikin – all received aid, more or less. All, that is, but those who wanted a truly free individualist society.

American Business Leaders Support the Cause of Fascism

"Neither was aid restricted to statist Bolsheviks and statist counter-Bolsheviks. John P. Diggins, in *Mussolini and Fascism: The View from America*, has noted in regard to Thomas Lamont of Guaranty Trust that:

"Of all American business leaders, the one who most vigorously patronized the cause of Fascism was Thomas W. Lamont. Head of the powerful J. P. Morgan banking network, Lamont served as something of a business consultant for the government of Fascist Italy.

"Lamont secured a \$100 million loan for Mussolini in 1926 at a particularly crucial time for the Italian dictator. We might remember too that the director of Guaranty Trust was the father of Corliss Lamont, a domestic Communist. This evenhanded approach to the twin totalitarian systems communism and fascism, was not confined to the Lamont family. For example, Otto Kahn, director of American International Corporation and the Kuhn, Loeb & Co., felt sure that 'American capital invested in Italy will find safety, encouragement, opportunity and reward.' This is the same Otto Kahn who lectured the socialist League of Industrial Democracy in 1924 that *its* objectives were *his* objectives. They differed only – according to Otto Kahn – over the means of achieving these objectives.

Rockefeller's Public Relations Man is Responsible for Selling the Soviet Regime to the American People

"Ivy Lee, Rockefeller's public relations man, made similar pronouncements, and was responsible for selling the Soviet regime to the gullible American public in the late 1920s. We also have observed that Basil Miles, in charge of the Russian desk at the State Department and a former associate of William Franklin Sands, was decidedly helpful to the businessmen promoting Bolshevik causes; but in 1923 the same Miles authored a profascist article, 'Italy's Black Shirts and Business. 'Success of the Fascists is an expression of Italy's youth,' wrote Miles while glorifying the fascist movement and applauding its esteem for American business." (Antony C. Sutton, *Wall Street and the Bolshevik Revolution*, pp. 172-174.)

A Plan to Perpetuate the Power Base of Financiers

Professor Sutton next outlines a plan financed by Andrew Carnegie which guaranteed that the international financiers and industrialists would continue in power:

"The Marburg Plan, financed by Andrew Carnegie's ample heritage, was produced in the early years of the twentieth century. It suggests premeditation for this kind of superficial schizophrenia, which in fact masks an integrated program of power acquisition: 'What then if Carnegie and his unlimited wealth, the international financiers and the Socialists could be organized in a movement to compel the formation of a league to enforce peace.'

Socialism on a Global Basis

"The governments of the world, according to the Marburg Plan, were to be socialized while the ultimate power would remain in the hands of the international financiers 'to control its councils and enforce peace [and so] provide a specific for all the political ills of mankind."

"This idea was knit with other elements with similar objectives. Lord Milner in England provides the transatlantic example of banking interests recognizing the

virtues and possibilities of Marxism. Milner was a banker, influential in British wartime policy, and pro-Marxist. In New York the socialist "X" club was founded in 1903. It counted among its members not only the Communist Lincoln Stefens, the socialist William English Walling, and the Communist banker Morris Hillquit, but also John Dewey, James T. Shotwell, Charles Edward Russell, and Rufus Weeks (vice president of New York Life Insurance Company). The annual meeting of the Economic Club in the Astor Hotel, New York, witnessed socialist speakers. In 1908, when A. Barton Hepburn, president of Chase National Bank, was president of the Economic Club, the main speaker was the aforementioned Morris Hillquit, who 'had abundant opportunity to preach socialism to a gathering which represented wealth and financial interests.'

Growth of the Modern Internationalist Movement

"From these unlikely seeds grew the modern internationalist movement, which included not only the financiers Carnegie, Paul Warburg, Otto Kahn, Bernard Baruch, and Herbert Hoover, but also the Carnegie Foundation and its progeny *International Conciliation*. The trustees of Carnegie were, as we have seen, prominent on the board of American International Corporation. In 1910 Carnegie donated \$10 million to found the Carnegie Endowment for International Peace, and among those on the board of trustees was Elihu Root (Root Mission to Russia, 1917), Cleveland H. Dodge (a financial backer of President Wilson), George W. Perkins (Morgan partner), G. J. Balch (AIC and Amsinck), R. F. Herrick (AIC), H. W. Pritchett (AIC), and other Wall Street luminaries. Woodrow Wilson came under the powerful influence of – and indeed was financially indebted to – this group of internationalists. As Jennings C. Wise has written, 'Historians must never forget that Woodrow Wilson...made it possible for Leon Trotsky to enter Russia with an American passport.'

"But Leon Trotsky also declared himself an internationalist. We have remarked with some interest his high-level internationalist connections, or at least friends, in Canada. Trotsky then was not pro-Russian, or pro-Allied, or pro-German, as many have tried to make him out to be. Trotsky was *for* world revolution, *for* world dictatorship; he was, in one word, an internationalist. Bolshevists and bankers have ten this significant common ground – internationalism. Revolution and international finance are not at all inconsistent if the result of revolution is to establish more centralized authority. International finance prefers to deal with central governments. The last thing the banking community wants is laissez-faire economy and decentralized power because these would disperse power.

The Goal of a Monopoly – a Captive World Market

"This, therefore, is an explanation that fits the evidence. This handful of bankers and promoters was not Bolshevik, or Communist, or socialist, or Democrat, or even American. Above all else these men wanted markets, preferably captive

international markets – and wanted markets that could be exploited monopolistically without fear of competition from Russians, Germans, or anyone else – including American businessmen outside the charmed circle. This closed group was apolitical and amoral. In 1917, it had a single-minded objective – a captive market in Russia, all presented under, and intellectually protected by, the shelter of a league to enforce the peace.

American Firms Build the Soviet Union

"Wall Street did indeed achieve its goal. American firms controlled by this syndicate were later to go on and build the Soviet Union, and today are well on their way to bringing the Soviet military-industrial complex into the age of the computer.

A Plea for Humanism and Collectivism

"Today the objective is still alive and well. John D. Rockefeller expounds it in his book *The Second American Revolution* – which sports a five-pointed star on the title page. The book contains a naked plea for humanism, that is, a plea that our first priority is to work for others. In other words, a plea for collectivism. Humanism is collectivism. It is notable that the Rockefellers, who have promoted this humanistic idea for a century, have not turned their OWN property over to others. Presumably it is implicit in their recommendation that *we* all work *for* the Rockefellers. Rockefeller's book promotes collectivism under the guises of 'cautious conservatism' and 'the public good.' It is in effect a plea for the continuation of the earlier Morgan-Rockefeller support of collectivist enterprises and mass subversion of individual rights.

The Alliance Between International Finance and International Revolution

"In brief, the public good has been, and is today, used as a device and an excuse for self-aggrandizement by an elitist circle that pleads for world peace and human decency. But so long as the reader looks at world history in terms of an inexorable Marxian conflict between capitalism and communism, the objectives of such an alliance between international finance and international revolution remain elusive. So will the ludicrousness of promotion of the public good by plunderers. If these alliances still elude the reader, then he should ponder the obvious fact that these same international interests and promoters are always willing to determine what *other* people should do, but are signally unwilling to be first in line to give up their own wealth and power. Their mouths are open, their pockets are closed.

The Monopolist Seeks to Control Congress and Let Society Work for the Monopolist

"This technique, used by the monopolists to gouge society, was set forth in the early twentieth century by Frederick C. Howe in *The Confessions of a Monopolist*.

First, says Howe, politics is a necessary part of business. To control industries it is necessary to control Congress and the regulators and thus make society go to work for you the monopolist. So, according to Howe, the two principles of a successful monopolist are, 'First, let Society work for you; and second, make a business of politics.' These, wrote Howe, are the basic 'rules of big business.'

Evidence of the Monopolist's Plan

"Is there any evidence that this magnificently sweeping objective was also known to Congress and the academic world? Certainly the possibility was known and known publicly. For example, witness the testimony of Albert Rhys Williams, an astute commentator on the revolution, before the Senate Overman Committee:

"...it is probably true that under the Soviet government industrial life will perhaps be much slower in development than under the usual capitalistic system. But why should a great industrial country like America desire the creation and consequent competition of another great industrial rival? Are not the interests of America in this regard in line with the slow tempo of development which Soviet Russia projects for herself?

"SENATOR WOLCOTT: Then your argument is that it would be to the interest of America to have Russia repressed?

"MR. WILLIAMS: Not repressed....

"SENATOR WOLCOTT: You say. Why should America desire Russia to become an industrial competitor with her?

"MR. WILLIAMS: This is speaking from a capitalistic standpoint. The whole interest of America is not, I think, to have another great industrial rival, like Germany, England, France, and Italy, thrown on the market in competition. I think another government over there besides the Soviet government would perhaps increase the tempo or rate of development of Russia, and we would have another rival. Of course, this is arguing from a capitalistic standpoint.

"SENATOR WOLCOTT: So you are presenting an argument here which you think might appeal to the American people, your point being this, that if we recognize the Soviet government of Russia as it is constituted we will be recognizing a government that can not compete with us in industry for a great many years?

"MR. WILLIAMS: That is a fact.

"SENATOR WOLCOTT: That is an argument that under the Soviet government Russia is in no position, for a great many years at least, to approach America industrially?

"Mr. WILLIAMS: Absolutely.

A Clue to the Revisionist Interpretation of Russian History

"And in that forthright statement by Albert Rhys Williams is the basic clue to the revisionist interpretation of Russian history over the past half century.

"Wall Street, or rather the Morgan-Rockefeller complex represented at 120 Broadway and 14 Wall Street, had something very close to Williams' argument in mind. Wall Street went to bat in Washington for the Bolsheviks. It succeeded. The Soviet totalitarian regime survived. In the 1930s foreign firms, mostly of the Morgan-Rockefeller group, built the five-year plans. They have continued to build Russia, economically and militarily. On the other hand, Wall Street presumably did not foresee the Korean War and the Vietnam War – in which 100,000 Americans and countless allies lost their lives to Soviet armaments built with this same imported U.S. technology. What seemed a farsighted, and undoubtedly profitable, policy for a Wall Street syndicate, became a nightmare for millions outside the elitist power circle and the ruling class." (Antony C. Sutton, *Wall Street and the Bolshevik Revolution*, pp. 174-179.)

Financing the Enemy

The above summary by Professor Sutton adequately demonstrates the power and influence which has been accumulated in the hands of certain international financiers and businessmen. In addition to creating a captive market, it should be asked if the Soviet military-industrial complex was built by elite financial groups to serve as a motivator for integration of the Western world? Was an "enemy" deliberately created to scare and force the Western world to unite or converge? In the face of a giant "enemy" in Moscow and Peking, the Western world has united according to the long-range plans of the elite financial groups in the world. The Western world, its politicians and scholars have played into the hands of the international financiers. It was they who created the communist menace. It was they who have sustained it financially. The Soviet Union and China and all socialist economies would have collapsed long ago without continued injections of taxpayer's money – predominately from the United States. Socialist economics are built on false principles and incapable of working efficiently, to say nothing of the loss of freedom inherent in socialist ideology.

The bankers and industrialists who make up the elite power structure in the world are desirous to control the earth – its people and resources. They, therefore, constructed a philosophy or ideology which would allow them to gain their prize – control of the earth. The entire world, including the United States, has adopted the principles of socialism to one degree or another. The elite power structure or financial groups now control the world economy and are strengthening international bodies to govern it more adequately.

Part III – Wall Street and FDR

In the 1930s the New Deal almost destroyed the free enterprise system in America, however, the corporate socialists operating the giant multinational corporations out of Wall Street remained almost untouched. The giant corporations prospered by New Deal policies while the small businesses of America were strangled by regulatory agencies and bureaucratic orders.

The Origin of Corporate Socialism

In Antony Sutton's second treatise on Wall Street he demonstrates that President Franklin D. Roosevelt was not against business per se, he just shared John D. Rockefeller's dislike of free enterprise and competition. Sutton documents that FDR was an elitist who guided public policy to benefit the select few who run Wall Street and control the United States economy. Sutton calls those businessmen who make society or the public taxpayer work for them corporate socialists. He outlined the origins of corporate socialism as follows:

"Old John D. Rockefeller and his 19th century fellow-capitalists were convinced of one absolute truth: that no great monetary wealth could be accumulated under the impartial rules of a competitive laissez-faire society. The only sure road to the acquisition of massive wealth was monopoly: drive out your competitors, reduce competition, eliminate laissez-faire, and above all get state protection for your industry through compliant politicians and government regulation. This last avenue yields a legal monopoly, and a legal monopoly always leads to wealth.

The Robber Baron Scheme is the Socialist Plan

"The robber baron schema is also, under different labels, the socialist plan. The difference between a corporate state monopoly and a socialist state monopoly is essentially only the identity of the group controlling the power structure. The essence of socialism is monopoly control by the state using hired planners and academic sponges. On the other hands, Rockefeller, Morgan, and their corporate friends aimed to acquire and control *their* monopoly and to maximize its profits through influence in the state political apparatus; this, while it still needs hired planners and academic sponges, is a discreet and far more subtle process than outright state ownership under socialism. Success for the Rockefeller gambit has depended particularly upon focusing public attention upon largely irrelevant and superficial historical creations, such as the myth of a struggle between capitalists and communists, and careful cultivation of political forces by big business. We call this phenomenon of corporate legal monopoly – market control acquired by using political influence – by the name of corporate socialism.

Confessions of a Monopolist

"The most lucid and frank description of corporate socialism and its mores and objectives is to be found in a 1906 booklet by Frederick Clemson Howe, *Confessions of a Monopolist*.

Corporate Socialism is Making Society Work for the Elites

"Frederick Howe's role in the 1917 Bolshevik Revolution and its aftermath was described in *Wall Street and the Bolshevik Revolution*. Howe also emerges in Roosevelt's New Deal as consumer counsel in the Agricultural Adjustment Administration. So Howe's interest in society and its problems spans the early 20th century, from his association with Newton D. Baker, later Secretary of War, to communist Lincoln Steffens. As a special U.S. Commissioner, Howe made studies of municipal ownership of public utilities in England and in 1914 was appointed by President Wilson as U.S. Commissioner of Immigration.

"What is the secret of making great wealth? Howe answers the question as follows: 'Mr. Rockefeller may think he made his hundreds of millions by economy, by saving on his gas bills, but he didn't. He managed to get the people of the globe to work for him....'

"In brief, corporate socialism is intimately related to making society work for the few.

The Monopolists Get the Planet to Work for Them

"This is the significant theme in Howe's book, expressed time and time again, with detailed examples of the 'let others work for you' system at work. How did Mr. Rockefeller and his fellow monopolists get the globe to work for them? It went like this, according to Howe:

"This is the story of something for nothing – of making the other fellow pay. This making the other fellow pay, of getting something for nothing, explains the lust for franchises, mining rights, tariff privileges, railway control, tax evasions. All these things mean monopoly, and all monopoly is bottomed on legislation.

"And monopoly laws are born in corruption. The commercialism of the press, or education, even of sweet charity, is part of the price we pay for the special privileges created by law. The desire of something for nothing, of making the other fellow pay, of monopoly in some form or other, is the cause of corruption. Monopoly and corruption are cause and effect. Together, they work in Congress, in our Commonwealths, in our municipalities. It is always so. It always has been so. Privilege gives birth to corruption, just as the poisonous sewer breeds disease. Equal chance, a fair field and no favors, the 'square deal' are never corrupt. They do not appear in legislative halls nor in Council Chambers. For these things mean

labor for labor, value for value, something for something. This is why the little business man, the retail and wholesale dealer, the jobber, and the manufacturer are not the business men whose business corrupts politics.

A Politically Run Economy

"Howe's opposite to this system of corrupt monopoly is described as 'labor for labor, value for value, something for something.' But these values are also the essential hall marks of a market system, that is, a purely competitive system, where market clearing prices are established by impartial interaction of supply and demand in the market place. Such an impartial system cannot, of course, be influenced or corrupted by politics. The monopoly economic system based on corruption and privilege described by Howe is a politically run economy. It is at the same time also a system of disguised forced labor, called by Ludwig von Mises the *Swangswirtschaft* system, a system of compulsion. It is this element of compulsion that is common to all politically run economies: Hitler's New Order, Mussolini's corporate state, Kennedy's New Frontier, Johnson's Great Society, and Nixon's Creative Federalism. Compulsion was also an element in Herbert Hoover's reaction to the depression and much more obviously in Franklin D. Roosevelt's New Deal and the National Recovery Administration.

Writing the Rules and Regulations to Protect Wealth

"It is this element of compulsion that enables a few – those who hold and gain from the legal monopoly – to live in society at the expense of the many. Those who control or benefit from the legislative franchises and regulation and who influence the government bureaucracies at the same time are determining the rules and regulations to protect their present wealth, prey on the wealth of others, and keep out new entrants from their business. For example to make the point clear, the Interstate Commerce Commission, created in 1880, exists to restrict competition in the transportation industry, not to get the best deal possible for shippers. Similarly, the Civil Aeronautics Board exists to protect the domestic aviation industry, not the airline traveler. For a current example, among hundreds, witness the CAB seizure in July 1974 of a Philippines Air Lines (PAL) DC-10 at San Francisco airport. What sin had PAL committed? The airline merely substituted a DC-10 plane, for which equipment CAB had not granted permission, for a DC-8. Who gained? The domestic U.S. airlines, because of less competition. Who lost? The traveler denied seats and a choice of equipment. Any doubts about whose side the CAB might be on were dispelled by article a few weeks later in *The Wall Street Journal* (August 13, 1974) entitled 'CAB Is an Enthusiastic Backer of Moves to Trim Airline Service, Increase Fares.' This piece contained a gem by CAB vice chairman Whitney Gilliland: 'We've had too much emphasis on passenger convenience in the past.' Gilliland added that the CAB must be more tolerant of capacity-packed planes, 'even if it may mean somebody has to wait a day to get a flight.'

Regulatory Agencies are Devices to Shield Elite Industries from Competition

"In brief, regulatory agencies are devices to use the police power of the state to shield favored industries from competition, to protect their inefficiencies, and to guarantee their profits. And, of course, these devices are vehemently defended by their wards: the regulated businessmen or, as we term them, 'the corporate socialists.'

Corporate Socialism is a System Where the Elite Hold Legal Monopolies

"This system of legal compulsion is the modern expression of Frederic Bastiat's dictum that socialism is a system where everyone attempts to live at the expense of everyone else. Consequently, corporate socialism is a system where those few who hold the legal monopolies of financial and industrial control profit at the expense of all others in society.

The Federal Reserve System is a Private Banking Monopoly

"In modern America the most significant illustration of society as a whole working for the few is the 1913 Federal Reserve Act. The Federal Reserve System is, in effect, a private banking monopoly, not answerable to Congress or the public, but with legal monopoly control over money supply without let or hindrance or even audit by the General Accounting Office. It was irresponsible manipulation of money supply by this Federal Reserve System that brought about the inflation of the 1920s, the 1929 Depression, and so the presumed requirement for a Roosevelt New Deal..." (Antony C. Sutton, *Wall Street and FDR*, New Rochelle, NY: Arlington House Publishers, 1975, pp. 72-75.)

The Literary Path of Support for Corporate Socialism

The corporate directors have subsidized a multitude of books, documents, etc., which argue the case for corporate socialism. Sutton traces part of their ideology in the following paragraphs:

"One can trace a literary path by which prominent financiers have pushed for national planning and control for their own benefit and that ultimately evolved into the Roosevelt New Deal.

"In the years following the 1906 publication of Howe's *Confessions of a Monopolist*, Wall Street financiers made book-length literary contributions, none quite as specific as Howe, but all pushing for the legal institutions that would grant the desired monopoly and the control that flows from this monopoly. From these books, we can trace New Deal ideas and the theoretical base upon which corporate socialism later came to be justified. Two themes are common in these Wall Street literary efforts. First, that individualism, individual effort, and individual initiative are out of date and that 'destructive' competition, usually termed 'blind competition'

or 'dog-eat-dog competition' is outmoded, unwanted, and destructive of human ideals. Second, we can identify a theme that follows from this attack on individualism and competition to the effect that great advantages accrue from cooperation, that cooperation advances technology, and that cooperation prevents the 'wastes of competition.' It is then concluded by these financier philosophers that trade associations and ultimately economic planning – in other words, enforced 'cooperation – are a prime objective for responsible and enlightened modern businessmen.

"Such themes of cooperation and rejection of competition are expressed in different ways and with varying degrees of lucidity. Businessmen are not persuasive writers. Their books tend to be turgid, superficially self-seeking, and somewhat weightily pedantic. A few such examples will, however, demonstrate how Wall Street corporate socialists made their case.

The Leading Wall Street Proponents of Corporate Socialism

"Bernard Baruch was ... [an] outstanding corporate socialist.... After Baruch and the Warburgs, also discussed in the next chapter, the next most prolific writer was influential banker Otto Kahn of Kuhn, Loeb & Co.

"Kahn is notable for his support of both the Bolshevik Revolution and Benito Mussolini, support which he concretized in such totalitarian expressions as, 'The deadliest foe of democracy is not autocracy but liberty frenzied.' On socialism, Otto Kahn stated his sympathy toward its objectives on many occasions. For instance his address to the socialist League of Industrial Democracy in 1924 included the following:

"Let me point out that such measures as, for instance, the progressive income tax, collective bargaining by employees, the eight-hour day, the governmental supervision and regulation of railroads and of similar natural monopolies or semi-monopolies, are approved by the sense of justice of the business community, provided the application of such measures is kept within the limits of reason, and that they would not be repealed by business if it had the power to repeal them.

"What you Radicals and we who hold opposing views differ about, is not so much the end as the means, not so much what should be brought about as how it should and can be brought about, believing as we do, that rushing after the Utopian not only is fruitless and ineffectual, but gets into the way of, and retards, progress toward realizing attainable improvement.

"With all due respect, I venture to suggest that Radicalism too often tends to address itself more to theoretical perfection than to concrete amelioration; to phantom grievances, or grievances of the past, which have lost their reality, rather than to actual matters of the day; to slogans, dogmas, professions, rather than to facts.

"A number of these financier-philosophers from Wall Street were trustees of the Brookings Institution in Washington, D.C., responsible for many of the policy guides to achieve this desired system. Robert S. Brookings, founder of the Brookings Institution, is generally termed an economist, but Brookings himself wrote: 'I certainly have no claim to that professional title. I write only as one who, through a long business experience of more than sixty years, has had much to do with manufacturing and distribution...' In his self-described role of businessman, Brookings published three books: *Industrial Ownership*, *Economic Democracy*, and *The Way Forward*. In these three books, Brookings argues that classical political economy, as reflected in the work of Adam Smith and his school,

"While logically convincing, was actually incomplete in that it made no allowance for the moral and intellectual development of man and his dependence on nationalism for its expression, so ably presented later by Adam Muller and Frederick List, or for the economic influence of mechanical production upon the relation of capital to labor.

Rejection of the Free Market System

"Consequently, but without presenting his evidence, Brookings rejects the free enterprise ideas of Adam Smith and accepts the statist ideas of List – also, by the way, reflected in the Hitlerian corporate state. From rejection of free enterprise Brookings finds it quite easy to deduce a 'moral' system rejecting the market place and substituting an approximation to the Marxist labor theory of value. For example, Brookings writes:

"A sound system of economic morality demands therefore that instead of our paying labor merely a market wage, the minimum necessary to secure its services, capital should receive the market wage necessary to secure its services, and the balance should go to labor and the consuming public.

The Elite Attack the Free Market System

"From this quasi-Marxist argument Brookings constructs, rather vaguely and without detailed support, the outlines of proposals needed to combat the 'evils' of the prevailing market system. Of these proposals, 'The first is the revision of the anti-trust laws in such a way as to permit extensive cooperation.' This, argues Brookings, would have two effects: advance research and development and flatten out the business cycle. Just how these objectives follow from 'cooperation' is not stated by Brookings, but he cites Herbert Hoover at length to support his argument, and particularly Hoover's article, 'If Business Doesn't, Government Will.'

"Then, like any good socialist, Brookings concludes: 'Efficiently managed corporations have nothing to fear from intelligent public supervision designed to protect the public and the trade alike from grasping and intractable minorities.' This is necessary because, Brookings argues elsewhere, statistics indicate that most

businesses operate inefficiently, 'So we know from sad experience that blind or ignorant competition has failed to make its reasonable contribution through earnings to our national economic needs.'

Brookings Attacks the Profit Motive

"In 1932 Brookings emerged from his shell in *The Way Forward* to become even more outspoken about developments in Soviet Communism:

"The verbal damning of communism now prevalently popular in the United States will get us nowhere. The decision between capitalism and communism hinges on one point. Can capitalism adjust itself to this new age? Can it move out from its old individualism, dominated by the selfish, profit motive, and so create a new co-operative epoch with social planning and social control, that can serve, better than it has, the welfare of all the people? If it can, it can survive. If it cannot, some form of communism will be forced upon our children. Be sure of that!

Brookings Supports Fascism

"And in the same book Brookings had good words to say about another forced labor system, Italian fascism:

"Although Italy is an autocracy under the dictatorship of the Duce, every economic interest of the country is afforded opportunity for discussion and negotiation so that they may, by mutual agreement, arrive at a fair compromise of their differences. The government will not permit, however, either through lockouts or strikes, any interference with the productivity of the nation, and if, in the last analysis, the groups fail to agree among themselves, the government through its minister or the labor court determines the solution of all problems. In Italy as elsewhere, however, the autocracy of capital seems to exist, and the general feeling among the working classes is that government favors the employers.'

"What then is preeminent in Brookings' writing in his predilection for *any* social system, communism, fascism, call it what you will, that reduces individual initiative and effort and substitutes collective experience and operation. What is left unsaid by Brookings and his fellow financier philosophers is the identity of the few running the forced labor collective. It is implicit in their arguments that the operators of the system, will be the corporate socialists themselves.

George W. Perkins Attacks the Free Enterprise System

"From the purely theoretical proposals of Brookings we can move to those of George W. Perkins, who combined parallel proposals with some effective, but hardly moral ways of putting them into practice.

"George W. Perkins was the forceful, energetic builder of the great New York Life Insurance Company. Perkins was also, along with Kahn and Brookings, an articulate expounder of the evils of competition and the great advantages to be gained from ordered cooperation in business. Perkins preached this collectivist theme as one of a series of lectures by businessmen at Columbia University in December 1907. His speech was hardly a roaring success; biographer John Garraty claims that when it was over:

"...The President of Columbia, Nicholas Murray Butler, hurried off without a word of congratulations, evidently believing, according to Perkins, that he had unwittingly invited a dangerous radical to Morningside Heights. For Perkins had attacked some of the basic concepts of competition and free enterprise.

"Garraty summarizes Perkins' business philosophy:

"The fundamental principle of life is co-operation rather than competition – such was the idea that Perkins developed in his talk. Competition is cruel, wasteful, destructive, outmoded; co-operation, inherent in any theory of a well-ordered Universe, is humane, efficient, inevitable and modern.

Planning Proposals for Material and Human Resources

"Again, as with Brookings, we find proposals for 'elimination of waste' and more 'planning' for material and human resources and the concept that big business has 'responsibilities to society' and is more likely to act fairly toward labor than small business. These high-sounding phrases are, of course, impressive – particularly if New York Life Insurance had lived up to its social do-good sermons. Unfortunately, when we probe further, we find evidence of wrongdoing by New York Life Insurance and investigation of this wrongdoing by the State of New York, which found a decidedly antisocial ring about New York Life's corporate behavior. In 1905-06 the Armstrong Committee (the New York State Legislature Joint Committee on Investigation of Life Insurance) found that New York Life Insurance Company had been a liberal contributor to the Republican National Committee in 1896, 1900, and 1904. Without question, these financial contributions were to advance the interests of the company in political circles. In 1905 John A. McCall, president of New York Life Insurance, was called before the New York investigating committee and proceeded to advance the idea that the defeat of Byran and free silver coinage was for him a *moral* issue. According to McCall, '...I consented to a payment to defeat Free Silver, not to defeat the Democratic party, but to defeat the Free Silver heresy, and thank God that I did it.'

Corporate Financiers Do Not Support the U.S. Constitution

"At the same hearing the vice president of Mutual Life Insurance also advanced the interesting concept that business had a 'duty' to 'scotch' unwelcome ideas and policies. The history of corporate financing of politics has hardly maintained the

principles of the Constitution and a free society. More specifically, there is a gross inconsistency between the social do-good principles of cooperation advanced by Perkins and his fellow businessmen and the contemporary antisocial behavior of his own New York Life Insurance Company.

Corporate Socialism is a Vehicle to Acquire Wealth at the Expense of Society

"In brief, the principles of corporate socialism are but a thin veneer for the acquisition of wealth by a few at the expense of the many.

"We can now look profitably at the preaching of those financiers more intimately associated with Roosevelt and the New Deal. One such financier-philosopher who expressed his collectivist ideas in writing was Edward Filene (1860-1937). The Filenes were a family of highly innovative businessmen, owners of the large department store William Filene's Sons Co. in Boston. A vice president of Filene's became one of the three musketeers running the National Recovery Administration in 1933; the other two of the triumvirate were Walter Teagle, president of Standard Oil and John Raskob, vice president of Du Pont and General Motors.

Edward Filene Supports Corporate Socialism

"From the turn of the century Edward Filene concerned himself with public affairs. He served as chairman of the Metropolitan Planning Commission of Boston, promotor of people's banks, and provided assistance to various cooperative movements. Filene was active in the Red Cross and the U.S. Chamber of Commerce; a founder of the League to Enforce Peace; a founder and later president of the Cooperative League, subsequently renamed the Twentieth Century Fund; and a member of the Foreign Policy Association and the Council on Foreign Relations. In Roosevelt's era Filene was chairman of the Massachusetts State Recovery Board and active in the 1936 campaign for FDR's reelection. Filene wrote several books, of which two, *The Way Out* (1924) and *Successful Living in this Machine Age*, (1932), express his philosophical leanings. In *The Way Out*, Filene emphasizes the theme of reducing waste, and the shortsightedness of competition and stresses the value of cooperation between business and government. Filene summarizes his argument as follows:

"Two things are clear. The first is that the business in order to be good business must itself be conducted as a public service. The second is that the finest possible public service of business men is that rendered in and through the private businesses of the world.

"This 'public service is private business' theme is expanded in another of his books:

"My own attitude is that business must undertake social planning, but neither for the purpose of snuffing out new theories nor of preserving old ones, but because there has been a social revolution. The old order has gone and by no possibility can we bring it back. We are living in a new world. It is a world in which mass production has related everybody to everybody; and our plans, therefore, must take everybody into consideration.

The Road to War

"We also find in Filene 'the road to peace is the balance of power' argument – a repeat of a 19th-century formula resurrected by Henry Kissinger in the 1970s and one that has always ultimately led to war rather than peace. Filene phrases his version as follows:

"No wonder there was war. Peace, it was soon discovered, could be maintained only by a balance of power between the larger competitors, and that balance of power was frequently upset. Eventually the whole impossible situation exploded in the greatest war of human history. The World War did not cause the world change which we have lately been noting. It was, rather, one of the phenomena of that change, just as the French Revolution was a phenomenon of the First Industrial Revolution.'

Myron C. Taylor – Chairman of U.S. Steel

"This theme of promotion of the public interest as a matter of primary benefit to business itself is also found in Myron C. Taylor, chairman of United States Steel Company. The public interest, Taylor argues, needs cooperation by business for rational production. The blindness of big business is clear when Taylor denies this would also be restraint of trade. Taylor omits to explain how we can adjust production to consumption without compulsion of those who may not want to cooperate. Taylor summarizes his proposals as follows:

"The point, then, is to discover what we as a nation possess and to learn to use it rather than go out in search of the new only because it is new. The primary responsibility is on industry to find ways to promote the public interest and the interests of its own producers, employees, distributors, and customers, by making and carrying out whatever constructive plans may be permissible under the present laws, acting openly and, so far as possible, in cooperation with the Government. I confess I find it extremely hard to believe that constructive, cooperative plans sincerely undertaken by a basic industry for rationally adjusting production to demand in that industry, and which avoid any attempt artificially to fix or control prices, can be fairly regarded as in restraint of trade and commerce. For the sole effect would be to remove vital impairments of production, trade, and commerce, and to promote the public interests.

Walter C. Teagle – President of Standard Oil

"The Standard Oil contribution to this liturgy is expressed by Walter C. Teagle, president of Standard Oil Company of New Jersey and appointed by President Roosevelt to a top position in his NRA. Teagle phrases his version of corporate socialism as follows:

"The ills of the oil industry are peculiar to that industry and require peculiar remedies. These are modification of anti-trust laws, cooperation among producers, and the exercise of the policing power of the States.'

"More bluntly than the others, Teagle wants the police power of the State to enforce voluntary cooperation:

"Voluntary cooperation within the industry is not sufficient to remedy its ills. It would not be sufficient even if legal restrictions on cooperation were removed, although tremendous progress would result from the removal of such restrictions.

"To protect the correlative rights of producers and to enforce adequate conservation laws the police power of the State must be employed. This is a matter for State, rather than Federal action, but cooperation among various States and among the operating units of the industry will also be needed if production in the country at large is to be limited to the nation's markets. The solution of the problem therefore depends upon voluntary cooperation within the industry, upon exercise of the police power of the State, and upon cooperation among the various States concerned and among unites (sic) of the industry in the different States. To permit this both State and Federal anti-trust laws will need to be revised.'

Bernard Baruch – The Most Prestigious Financier of All Time

"These extracts reflect the basic outlook of our Wall Street financier philosophers. These were not minor figures on the Street. On the contrary, they were the powerful and influential elements and in significant cases associated with Roosevelt and the New Deal. Otto Kahn was a prime mover in the Federal Reserve System. Lamont and Perkins were key figures in the banking and insurance fields. Businessman Brookings gave his name and money to the influential research institute that produced the reports upon which much policy came to be based. Louis Kirstein, a vice president of Filene's firm, and Walter Teagle of Standard Oil became two of the three dominant men who ran the National Recovery Administration under Bernard Baruch's protege Hugh Johnson. Bernard Baruch was probably the most prestigious Wall Streeter of all time, perhaps even exceeding in influence both Morgan and Rockefeller. We will examine Baruch and the Warburgs next.

Wall Street Financiers Favor Every System Except the Free Market

"What was the philosophy of the financiers so far described? Certainly *anything* but laissez-faire competition, which was the last system they envisaged. Socialism, communism, fascism or their variants were acceptable. The ideal for these financiers was 'cooperation,' forced if necessary. Individualism was out, and competition was immoral. On the other hand, cooperation was consistently advocated as moral and worthy, and nowhere is compulsion rejected as immoral. Why? Because, when the verbiage is stripped away from the high-sounding phrases, compulsory cooperation was their golden road to a legal monopoly. Under the guise of public service, social objectives, and assorted do-goodism, it is fundamentally "Let society go to work for Wall Street." (Antony C. Sutton, *Wall Street and FDR*, pp. 75-83.)

Bernard Baruch's Influence in Washington, D.C.

One of Wall Street's most prominent and powerful figures in the past was Bernard Baruch. As head of the War Industries Board he was the economic dictator of America in 1918. Baruch had a great deal more influence on Roosevelt's New Deal policies than historians admit. Sutton sketched Baruch's influence in Washington as follows:

"While the Federal Reserve System and its private legal monopoly of the money supply has been a fount of wealth for its operators, the ultimate goal of making society work for the few as outlined by Frederick Howe and Clinton Roosevelt can be brought about only by planned control of the whole economy, and this requires compulsory adherence of the many smaller entrepreneurs to the dictates of the few deciding the plans to be followed.

A Device to Control the Unwanted Rigors of Competition

"The genesis of Roosevelt's NRA, a system that included compulsory adherence by small entrepreneurs to a plan devised by big business, can be traced from Bernard Baruch's U.S. War Industries Board, established and elaborated as an emergency wartime measure. In 1915, before the U.S. entered World War I, Howard E. Coffin, then chairman of General Electric, headed the U.S. Committee on Industrial Preparedness. In company with Bernard Baruch and Daniel Willard of the Baltimore and Ohio Railroad, Coffin was also a member of the Advisory Commission to the Council of National Defense. In 1915 Bernard Baruch was invited by President Woodrow Wilson to design a plan for a defense mobilization committee. This Baruch plan subsequently became the War Industries Board, which absorbed and replaced the old General Munitions Board. Margaret L. Coit, Baruch's biographer, describes the War Industries Board as a concept similar to cooperative trade associations, a device long desired by Wall Street to control the unwanted rigors of competition in the market place.

"Committees of industry, big business and small business, both represented in Washington, and both with Washington representation back home – this could be the backbone of the whole structure.

Wilson Appoints Baruch as Chairman of the War Industries Board

"By March 1918 President Wilson acting without Congressional authority, had endowed Baruch with more power than any other individual had been granted in the history of the United States. The War Industries Board, with Baruch as its chairman, became responsible for building all factories and for the supply of all raw material, all products, and all transportation, and all its final decisions rested with chairman Bernard Baruch. In brief, Baruch became economic dictator of the United States, or 'Marshal of Manufacturers' in Clinton Roosevelt's scheme. Yet, as Margaret Coit points out, '...the creation of this office was never specifically authorized by an Act of Congress.'

"So by the summer of 1918 Baruch, with extraordinary and unconstitutional powers, had, in his own words, 'finally developed a scheme of positive control' over the major portion of the industrial fabric.... Success bred courage for more success, and trade after trade was taken under control with an increasing willingness on the part of the interests affected.'

"At the time of the Armistice the W.I.B. comprised Baruch (chairman), Alexander Legge of International Harvester (vice chairman), with E.B. Parker and R.S. Brookings (whose ideas we have already examined) in charge of price fixing. Assistants to the chairman were: Herbert Bayard Swope, brother of Gerard Swope of General Electric; Clarence Dillon of the Wall Street firm Dillon, Read & Co.,; Harrison Williams; and Harold T. Clark.

Economic Planning in Peacetime

"Baruch's final report on W.I.B. activity was much more than a history of its operations; it was also a specific plan and recommendation for economic planning in peacetime. Baruch was not content merely to summarize the lessons to be learned for planning in war or for industrial preparedness in time of uneasy peace. On the contrary, Baruch's conclusions were directed, in his own words, to the 'industrial practices of peace' and to make recommendations 'relating to the business practices of normal times.' The bulk of the conclusions relate to change-over of a *planned* wartime economic system to a *planned* peacetime economic system, and even the suggestions for wartime practice are related to peacetime functions. Baruch suggested that the most important 'direct war lessons to be derived' from the operation of the War Industries Board were:

"1. The establishment of a peacetime skeleton organization with 50 commodity divisions, meeting to keep abreast of the development of industry and develop information. The thrust of this proposal was that the information needed

for peacetime planning should be collected and that the direction of the organization should stem from large-scale or major industry.

"2. That the government 'should devise some system for protecting and stimulating internal production of certain raw materials used in war,' and

"3. That war-related industries should be encouraged by the government to maintain skeleton organizations for wartime use.

Baruch Lays the Plan for Centralized Economic Planning in U.S.

"Apart from these quite elementary suggestions, Baruch is exclusively concerned in the report with peacetime 'planning.' First we are presented with the canard that, in some unstated way, 'the processes of trade' have changed and are now forced to give way before 'certain new principles of supervision.' This non sequitur is followed by the statement:

"'We have been gradually compelled to drift away from the old doctrine of Anglo-American law, that the sphere of Government should be limited to preventing breach of contract, fraud, physical injury and injury to property, and that the Government should exercise protection only over noncompetent persons.'

"It is necessary, writes Baruch, for government 'to reach out its arm' to protect 'competent individuals against the discriminating practices of mass industrial power.' While Baruch points to Federal control of the railroads and the merchant fleet, he does not state *why* the representatives of big business would be the best fitted to exercise this control. In other words, why the fox is proposed as the most competent being to run the chicken coop is left unstated. Baruch then slashes at the Sherman and Clayton anti-trust laws on the grounds that these statutes are merely efforts to force industry into the mold of 'simpler principles sufficient for the conditions of a bygone day,' and lauds the achievement of the War Industries Board because it had constructed hundreds of trade associations controlling prices and methods of distribution and production:

Centralizing Economic Power in Washington, D.C.

"'Many businessmen have experienced during the war, for the first time in their careers, the tremendous advantages, both to themselves and to the general public, of combination, of cooperation and common action with their natural competitors.'

"If these cooperative attributes are not continued, argues Baruch, then businessmen will be tempted 'and many of them will be unable to resist' to conduct 'their business for private gain with little reference to general public welfare.' On the other hand, trade associations can be of the greatest public benefit to achieve the desired end of cooperation. Baruch concludes:

"The question, then is what kind of Government organization can be devised to safeguard the public interest while these associations are preserved to carry on the good work of which they are capable.'

The Objectives of Bernard Baruch and Karl Marx are Identical

"Baruch, like any good socialist, proposes government organizations to develop these principles of cooperation and coordination.

"If the reader will shed for a moment the idea of a mutual antagonism between communism and capitalism, he will readily see in the writing of Bernard Baruch the basic objectives of Karl Marx writing in *The Communist Manifesto*. What is different between the two systems are the names of the elitist few running the operation known as state planning; the vanguard of the proletariat in Karl Marx is replaced by the vanguard of big business in Bernard Baruch.

The Elite Gain from Central Economic Planning of Society

"Who would gain from Baruch's proposal? The consumer? Not at all, because consumer interests are *always* protected by free competition in the market place, where goods and services are produced at the least cost, in the most efficient manner, and the consumer is given maximum choice among competing producers. The gainers from Baruch's proposals would be the few who control major industrial sectors – particularly iron and steel, raw materials, electrical goods, that is, those industries already well established and fearful of competition from more enterprising newcomers. In other words, the gainers from his proposal would be Bernard Baruch and the Wall Street coterie that effectively controls big business through its interlocking directorships. The gut issue then is: who benefits from these proposals for trade associations and government coordination of industry? The principal, indeed the only major benefactors-apart from the swarms of academic advisers, bureaucrats, and planners – would be the financial elite in Wall Street.

"So here we have, in Baruch's own words and ideas, an implementation of Frederick Howe's injunction to 'make society work for you,' the monopolist." (Antony C. Sutton, *Wall Street and FDR*, pp. 88-89.)

The Introduction of Keynesian Economics in America

In a chapter entitled, "FDR and the Corporate Socialist," Sutton summarizes his findings and concludes:

"It was under Roosevelt that quaint Keynesian notions – the modern versions of John Laws' con game with paper money – were introduced to Washington, and so the seeds of our present economic chaos were laid in the early 1930s under Roosevelt. Contemporary double digit inflation, a bankrupt Social Security system,

bumbling state bureaucracy, rising unemployment – all this and more can be traced to Franklin Delano Roosevelt and his legislative whirlwind.

A Looting of the American Economy

"But while we now pay the price for these unsound and irresponsible policies, so pervasive in prevailing misinformation that even the identity of the originators of Roosevelt's New Deal and their reasons have been forgotten. While our economists cover their blackboards with meaningless static equations, a dynamic looting operation of the economy has been in progress by the authentic formulators of the liberal New Deal. While the bleeding heart social engineers have screamed at capitalism as the cause of the world's misery, they have been blissfully unaware that their *own* social formulas in part emanated from – and have certainly been quietly subsidized by – these same so-called capitalists. The tunnel vision of our academic world is hard to beat and equalled only by their avarice for a piece of the action....

"Certainly, if sheer weight of printed paper has any influence, the power of any financial elite should have collapsed long ago. The establishment does appear to have considerable endurance, but nowhere near as much influence as many believe. The most important leg sustaining the credibility and so the power of the elite is the academic community. This group has, in large part, swapped truth and integrity for a piece of the political power and the financial action. Apparently academics can be bought – and you don't have to pay overly much.'

Elite Legislation Seeks to Create Legal Monopolies

"What we do find is that government intervention into the economy is the root of our present problems; that a Wall Street coterie has substantive, if subtle, muscle within this government structure to obtain legislation beneficial to itself; and that a prime example of this self-seeking legislation to establish legal monopoly under big business control was FDR's New Deal and, in particular, the National Recovery Administration....

The Thesis of Corporate Socialism

"The economic recovery part of the New Deal was a creation of Wall Street – specifically Bernard Baruch and Gerard Swope of General Electric – in the form of the Swope Plan.... [W]e expanded upon the idea of the politicization of business and formulated the thesis of corporate socialism: that the political way of running an economy is more attractive to big business because it avoids the rigors and the imposed efficiency of a market system. Further, through business control or influence in regulatory agencies and the police power of the state, the political system is an effective way to gain a monopoly, and a legal monopoly *always* leads to wealth. Consequently, Wall Street is intensely interested in the political arena and supports those political candidates able to maximize the amount of political

decision-making under whatever label and minimize the degree to which economic decisions in society are made in the market place. In brief, Wall Street has a vested interest in politics because through politics it can make society go to work for Wall Street. It can also thus avoid the penalties and risks of the market place....

Wall Street Creates a Central Banking Monopoly

"Under Woodrow Wilson Wall Street achieved a central banking monopoly, the Federal Reserve System. The significance of the International Acceptance Bank, controlled by the financial establishment in Wall Street, was that the Federal Reserve banks used the police power of the state to create for themselves a perpetual money-making machine: the ability to create money with a stroke of a pen or the push of a computer key. The Warburgs, key figures in the International Acceptance Bank – an overseas money-making machine – were advisers to the Roosevelt administration and its monetary policies. Gold was declared a 'barbaric relic,' opening the way to worthless paper money in the United States. In 1975, as we go to press, the fiat inconvertible dollar is obviously on the way to ultimate depreciation.

Wall Street Engineers Removal of Gold as Backing for American Currency

"Did Wall Street recognize the result of removing gold as backing for currency? Of course it did! Witness Paul Warburg to a Congressional Committee:

"'Abandonment of the gold standard means wildly fluctuating foreign exchanges and, therefore, the destruction of the free inflow of foreign capital and business. Weak countries will repudiate – or, to use the more polite expression, 'fund their debts' – but there will be no general demonetization of gold. Gold at the end of the war will not be worth less but more.'

A Financial Elite Whose Objective is the Monopoly Acquisition of Wealth

"The inevitable conclusion forced upon us by the evidence is that there may indeed exist a financial elite, as pointed out by Franklin D. Roosevelt, and that the objective of this elite is monopoly acquisition of wealth. We have termed this elite advocates of corporate socialism. It thrives on the political process, and it would fade away if it were exposed to the activity of a free market. The great paradox is that the influential world socialist movement, which views itself as an enemy of this elite, is in fact the generator of precisely that politicization of economic activity that keeps the monopoly in power and that its great hero, Franklin D. Roosevelt, was its self-admitted instrument." (Antony C. Sutton, *Wall Street and FDR*, pp. 171, 173-174, 176-177.)

The Development of Giant Monopolies to Rule the World Economy

Sutton's writings once again demonstrate the power of the international bankers, investment bankers, and corporate directors. They dominate not only Wall Street but every financial center in the world and the global economy. The objective of this triangular financial system is political power and financial gain. Their strategy is to empower governments to aid in their development of giant monopolies which will dominate and rule the world economy. In other words, a 'world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole.' (Carroll Quigley, *Tragedy and Hope*, The Macmillan Company, N.Y., 1966, p. 324.)

Part IV – Wall Street and the Rise of Hitler

One of the most incredible secrets of World War II is that Hitler's rise to power can be attributed to key Wall Street financiers and other international bankers and businessmen in Europe. In Professor Sutton's third book on Wall Street, he provides conclusive evidence that World War II was extremely profitable for select groups of the financial elite. Sutton carefully traces the financial support of Hitler through original documents and eye-witness accounts which prove that German industrialists and Wall Street financiers played a substantial role in the rise of Nazism.

The Rise of Modern Socialism

The rise of modern socialism and its support by the elite power structure is no accident. Sutton demonstrates that the same firms, and often the identical figures which were responsible for the Bolshevik Revolution in 1917, the financial and political backing of Franklin D. Roosevelt for president of the United States in 1933 also aided in the rise of Hitler.

Only Key Corporations Involved in the Official Circle of Financial Elite

At the beginning of his book, Sutton pointed out that not every major corporation is involved in the 'official' circle of the financial elite. He stated:

"...American companies associated with the Morgan-Rockefeller international investment bankers – not, it should be noted, the vast bulk of independent American industrialists – were intimately related to the growth of Nazi industry. It is important to note as we develop our story that General Motors, Ford, General Electric, DuPont and the handful of U.S. companies intimately involved with the development of Nazi Germany were – except for the Ford Motor Company – controlled by the Wall Street elite – the J. P. Morgan firm, the Rockefeller Chase Bank and a lesser extent the Warburg Manhattan bank. This book is not an indictment of *all* American industry and finance. It is an indictment of the 'apex' – those firms controlled through the handful of financial houses, the Federal Reserve

Bank system, the Bank for International Settlements, and their continuing international cooperative arrangements and cartels which attempt to control the course of world politics and economics." (Antony C. Sutton, *Wall Street and the Rise of Hitler*, Seal Beach: 76 Press, 1977, pp. 31-32.)

Wall Street and the Rise of Hitler

Sutton provides the reader of *Wall Street and the Rise of Hitler* with a superb summary of his findings of the role played by certain American corporate directors in financing the emergence of international socialism. The evidence which he amassed is incredibly revealing:

"We have demonstrated with documentary evidence a number of critical associations between Wall Street international bankers and the rise of Hitler and Naziism in Germany.

"First: that Wall Street financed the German cartels in the mid-1920s which in turn proceeded to bring Hitler to power.

"Second: that the financing for Hitler and his S.S. street thugs came in part from affiliates or subsidiaries of U.S. firms, including Henry Ford in 1922, payments by I.G. Farben and General Electric in 1933, followed by the Standard Oil of New Jersey and I.T.T. subsidiary payments to Heinrich Himmler up to 1944.

"Third: that U.S. multi-nationals under the control of Wall Street profited handsomely from Hitler's military construction program in the 1930s and at least until 1942.

"Fourth: that these same international bankers used political influence in the U.S. to cover up their wartime collaboration and to do this infiltrated the U.S. Control Commission for Germany.

"Our evidence for these four major assertions can be summarized as follows:

The Dawes and Young Plans for German Reparations

"In Chapter One we presented evidence that the Dawes and Young Plans for German reparations were formulated by Wall Streeters, temporarily wearing the hats of statesmen, and these loans generated a rain of profits for these international bankers. Owen Young of General Electric, Hjalmar Schacht, A Voegler, and others intimately connected with Hitler's accession to power had earlier been the negotiators for the U.S. and German sides, respectively. Three Wall Street houses – Dillon, Read; Harris, Forbes; and, National City Company – handled three-quarters of the reparations loans used to create the German cartel system, including the dominant I.G. Farben and Vereinigte Stahlwerke, which together produced 95 percent of the explosives for the Nazi side in World War II.

The Role of I.G. Farben

"The central role of I.G. Farben in Hitler's *coup d'etat* was reviewed in Chapter Two. The directors of American I.G. (Farben) were identified as prominent American businessmen: Walter Teagle, a close Roosevelt associate and backer and an NRA administrator; banker Paul Warburg (his brother Max Warburg was on the board of I.G. Farben in Germany); and Edsel Ford, Farben contributed 400,000 RM directly to Schacht and Hess for use in the crucial 1933 elections and Farben was subsequently in the forefront of military development in Nazi Germany.

Dominant Wall Streeters in A.E.G.

"A donation of 60,000 RM was made to Hitler by German General Electric (A.E.G.), which had four directors and a 25-30 percent interest held by the U.S. General Electric parent company.... [W]e found that Gerard Swope, an originator of Roosevelt's New Deal (its National Recovery Administration segment), together with Owen Young of the Federal Reserve Bank of New York and Clark Minor of International General Electric, were the dominant Wall Streeters in A.E.G. and the most significant single influence.

A.E.G. Plants Avoid Being Bombed by Allies

"We also found no evidence to indict the German electrical firm Siemens, which was *not* under Wall Street control. In contrast, there is documentary evidence that both A.E.G. and Oscram, the other units of the German electrical industry – both of which had U.S. participation and control – *did* finance Hitler. In fact, almost all directors of German General Electric were Hitler backers, either directly through A.E.G. or indirectly through other German firms. G.E. rounded out its Hitler support by technical cooperation with Krupp, aimed at restricting U.S. development of tungsten carbide, which worked to the detriment of the U.S. in World War II. We concluded that A.E.G. plants in Germany managed, by a yet unknown maneuver, to avoid bombing by the Allies.

The Role of Standard Oil of New Jersey

"An examination of the role of Standard Oil of New Jersey (which was and is controlled by the Rockefeller interests) was undertaken.... Standard Oil apparently did not finance Hitler's accession to power in 1933 (that part of the 'myth of Sidney Warburg' is not proven). On the other hand, payments were made up to 1944 by Standard Oil of New Jersey, to develop synthetic gasoline for war purposes on behalf of the Nazis and, through its wholly owned subsidiary, to Heinrich Himmler's S.S. Circle of Friends for political purposes. Standard Oil's role was technical aid to Nazi development of synthetic rubber and gasoline through a U.S. research company under the management control of Standard Oil. The Ethyl Gasoline Company, jointly owned by Standard Oil of New Jersey and General Motors, was instrumental in supplying vital ethyl lead to Nazi Germany – over the

written protests of the U.S. War Department – with the clear knowledge that the ethyl lead was for Nazi military purposes.

ITT Works Both Sides of World War II

"In Chapter Five we demonstrated that International Telephone and Telegraph Company, one of the more notorious multi-nationals, worked both sides of World War II through Baron Kurt von Schroder, of the Schroder banking group. I.T.T. also held a 28-percent interest in Focke-Wolfe aircraft, which manufactured excellent German fighter planes. We also found that Texaco (Texas Oil Company) was involved in Nazi endeavors through German attorney Westrick, but dropped its chairman of the board Rieber when these endeavors were publicized.

Henry Ford Was an Early Backer of Hitler

"Henry Ford was an early (1922) Hitler backer and Edsel Ford continued the family tradition in 1942 by encouraging French Ford to profit from arming the German Wehrmacht. Subsequently, these Ford-produced vehicles were used against American soldiers as they landed in France in 1944. For his early recognition of, and timely assistance to, the Nazis, Henry Ford received a Nazi medal in 1938. The records of French Ford suggest Ford Motor received kid glove treatment from the Nazis after 1940.

An Indictment of Wall Street

"The provable threads of Hitler financing are drawn together...and answer with precise names and figures the question, who financed Adolf Hitler? This chapter indicts Wall Street and, incidentally, no one else of consequence in the United States except the Ford family. The Ford family is not normally associated with Wall Street but is certainly a part of the 'power elite.'

The Nazi Inner Circle

"In earlier chapters we cited several Roosevelt associates, including Teagle of Standard Oil, the Warburg family, and Gerard Swope. In Chapter Eight the role of Putzi Hanfstaengl, another Roosevelt friend and a participant in the Reichstag fire, is traced. The composition of the Nazi inner circle during World War II, and the financial contributions of Standard Oil of New Jersey and I.T.T. subsidiaries, are traced in Chapter Nine. Documentary proof of these monetary contributions is presented. Kurt von Schroder is identified as the key intermediary in this S.S. 'slush fund.'

A Suppressed Book Reveals the Financing of Hitler

"Finally, in Chapter Ten we reviewed a book suppressed in 1934 and the 'myth of "Sidney Warburg."' The suppressed book accused the Rockefellers, the

Warburgs, and the major oil companies of financing Hitler. While the name 'Sidney Warburg' was no doubt an invention, the extraordinary fact remains that the argument in the suppressed 'Sidney Warburg' book is remarkably close to the evidence presented now. It also remains a puzzle why James Paul Warburg, fifteen years later, would want to attempt, in a rather transparently slipshod manner, to refute the contents of the 'Warburg' book, a book he claims not to have seen. It is perhaps even more of a puzzle why Warburg would choose Nazi von Papen's *Memoirs* as the vehicle to present his refutation.

The Role of the Morgan and Rockefeller Banks in World War II

"Finally, in Chapter Eleven we examined the roles of the Morgan and Chase Banks in World War II, specifically their collaboration with the Nazis in France while a major war was raging.

A Pattern of Subsidy and Political Manipulation

"In other words, as in our two previous examinations of the links between New York international bankers and major historical events, we find a provable pattern of subsidy and political manipulation.

"Looking at the broad array of facts presented in the three volumes of the Wall Street series, we find persistent recurrence of the same names: Owen Young, Gerard Swope, Hjalmar Schacht, Bernard Baruch, *etc.*; the same international banks: J. P. Morgan, Guaranty Trust, Chase Bank; and the same location in New York: usually 120 Broadway.

"This group of international bankers backed the Bolshevik Revolution and subsequently profited from the establishment of a Soviet Russia. This group backed Roosevelt and profited from New Deal socialism. This group also backed Hitler and certainly profited from German armament in the 1930s. When Big Business should have been running its business operations at Ford Motor, Standard of New Jersey, and so on, we find it actively and deeply involved in political upheavals, war, and revolutions in three major countries.

The 1929 Financial Crisis

"The version of history presented here is that the financial elite knowingly and with premeditation assisted the Bolshevik Revolution of 1917 in concert with German bankers. After profiting handsomely from the German hyper-inflationary distress of 1923, and planning to place the German reparations burden onto the backs of American investors, Wall Street found it had brought about the 1929 financial crisis.

Roosevelt and Hitler Plans for Fascist Takeovers of America and Germany

"Two men were then backed as leaders for major Western countries: Franklin D. Roosevelt in the United States and Adolf Hitler in Germany. The Roosevelt New Deal and Hitler's Four Year Plan had great similarities. The Roosevelt and Hitler plans were plans for fascist takeovers of their respective countries. While Roosevelt's NRA failed, due to then-operating constitutional constraints, Hitler's Plan succeeded.

"Why did the Wall Street elite, the international bankers, want Roosevelt and Hitler in power? This is an aspect we have not explored. According to the 'myth of "Sidney Warburg," Wall Street wanted a policy of revenge; that is, it wanted war in Europe between France and Germany. We know even from Establishment history that both Hitler and Roosevelt acted out policies leading to war.

A Remarkable Concentration of Power

"The link-ups between persons and events in this three-book series would require another book. But a single example will perhaps indicate the remarkable concentration of power within a relatively few organizations, and the use of this power.

"On May 1st, 1918, when the Bolsheviks controlled only a small fraction of Russia (and were to come near to losing even that fraction in the summer of 1918), the American League to Aid and Cooperate with Russia was organized in Washington, D.C. to support the Bolsheviks. This was not a 'Hands off Russia' type of committee formed by the communist Party U.S.A. or its allies. It was a committee *created by Wall Street* with George P. Whalen of Vacuum Oil Company as Treasurer and Coffin and Oudin of General Electric, along with Thompson of the Federal Reserve System, Willard of the Baltimore & Ohio Railroad, and assorted socialists.

An Interlock of Elites Support Revolution in the World

"When we look at the rise of Hitler and Naziism we find Vacuum Oil and General Electric well represented. Ambassador Dodd in Germany was struck by the monetary and technical contribution by the Rockefeller-controlled Vacuum Oil Company in building up military gasoline facilities for the Nazis. The Ambassador tried to warn Roosevelt. Dodd believe, in his apparent naivete of world affairs, that Roosevelt would intervene, but Roosevelt himself was backed by these same oil interests and Walter Teagle of Standard Oil of New Jersey and the NRA was on the board of Roosevelt's Warm Springs foundation. So, in but one of many examples, we find the Rockefeller-controlled Vacuum Oil Company prominently assisting in the creation of Bolshevik Russia, the military build-up of Nazi Germany, and backing Roosevelt's New Deal.

"Within the last decade or so, certainly since the 1960s, a steady flow of literature has presented a thesis that the United States is ruled by a self-perpetuating and unelected power elite. Even further, most of these books aver that this elite controls, or at the least heavily influences, all foreign and domestic policy decisions, and that no idea becomes respectable or is published in the United States without the tacit approval, or perhaps lack of disapproval, of this elitist circle.

Flow of Anti-Establishment Literature

"Obviously the very flow of anti-establishment literature by itself testifies that the United States cannot be wholly under the thumb of any single group or elite. On the other hand, anti-establishment literature is not fully recognized or reasonably discussed in academic or media circles. More often than not it consists of a limited edition, privately produced, almost hand-to-hand circulated. There are *some* exceptions, true; but not enough to dispute the observation that anti-establishment critics do not easily enter normal information/distribution channels.

"Whereas in the early and mid-1960s, any concept of rule by...any kind of elite, was reason enough to dismiss the proponent out of hand as a 'nut case,' the atmosphere for such concepts has changed radically. The Watergate affair probably added the final touches to a long-developing environment of skepticism and doubt.... In brief, no one any longer really believes the Establishment information process. And there is a wide variety of alternative presentations of events now available for the curious.

"Several hundred books, from the full range of the political and philosophical spectrum, add bits and pieces of evidence, more hypotheses, and more accusations. What was not too long ago a kooky idea, talked about at midnight behind closed doors,...is now openly debated – not, to be sure, in Establishment newspapers but certainly on non-network radio talk shows, the underground press, and even from time to time in books from respectable Establishment publishing houses.

Is There a Power Elite Behind the U.S. Government?

"So let us ask the question again: Is there an unelected power elite behind the U.S. Government?

"A substantive and often-cited source of information is Carroll Quigley, Professor of International Relations at Georgetown University, who in 1966 had published a monumental modern history entitled *Tragedy and Hope*. Quigley's book is apart from others in this revisionist vein, by virtue of the fact that it was based on a two-year study of the internal documents of one of the power centers. Quigley traces the history of the power elite.

"...the powers of financial capitalism had another far reaching aim, nothing less than to create a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole.'

"Quigley also demonstrates that the Council on Foreign Relations, the National Planning Association, and other groups are 'semi-secret' policy-making bodies under the control of this power elite....

Documentation of the Elite Power Structure

"Possibly, the papers used by Quigley had been vented, and did not include documentation on elitist manipulation of such events as the Bolshevik Revolution, Hitler's accession to power, and the election of Roosevelt in 1933. More likely, these political manipulations may not be recorded at all in the files of the power groups. They may have been unrecorded actions by a small *ad hoc* segment of the elite. It is noteworthy that the documents used by this author came from government sources, recording the day-to-day actions of Trotsky, Lenin, Roosevelt, Hitler, J. P. Morgan and the various firms and banks involved....

"Obviously any such exercise of unconstrained and supra-legal power is unconstitutional, even though wrapped in the fabric of law-abiding actions. We can therefore legitimately raise the question of the existence of a subversive force operating to remove constitutionally guaranteed rights.

"Twentieth-century history, as recorded in Establishment textbooks and journals, is inaccurate. It is a history which is based solely upon those official documents which various Administrations have seen fit to release for public consumption.

Establishment Version of World History is Designed to Hide a Pervasive Fabric of Deceit and Immoral Conduct

"But an accurate history cannot be based on a selective release of documentary archives. Accuracy requires access to all documents. In practice, as previously classified documents in the U.S. State Department files, the British Foreign Office, and the German Foreign Ministry archives and other depositories are acquired, a new version of history has emerged; the prevailing Establishment version is seen to be, not only inaccurate, but designed to hide a pervasive fabric of deceit and immoral conduct.

The Real Center of Political Power in America

"The center of political power, as authorized by the U.S. Constitution, is with an elected congress and an elected President, working within the framework and under the constraints of a Constitution, as interpreted by an unbiased Supreme Court. We have in the past *assumed* that political power is consequently carefully

exercised by the Executive and legislative branch, after due deliberation and assessment of the wishes of the electorate. In fact, nothing could be further from this assumption. The electorate has long suspected, but now knows, that political promises are worth nothing. Lies are the order of the day for policy implementors. Wars are started (and stopped) with no shred of coherent explanation. Political worlds have ever matched political deeds. Why not? Apparently because the center of political power has been elsewhere than with elected and presumably responsive representatives in Washington, and this power elite has its own objectives, which are inconsistent with those of the public at large. (Antony C. Sutton, *Wall Street and FDR*, pp. 163-172.)

Elite Power Structure is Masked from the Public

Professor Sutton's work demonstrates that self-perpetuating, elitist groups of international bankers, investment bankers, and corporate directors have combined to control the wealth, resources, and people on this planet. The financial elite are well above the people and nations of the earth.

The Seat of Political Power in America is Wall Street

Wall Street and the Bolshevik Revolution, *Wall Street and FDR* and *Wall Street and the Rise of Hitler* have greatly aided the researcher in pursuit of truth and understanding of the elite power structures which operate on the earth. Professor Sutton provides the following summary of his trilogy on corporate socialists and international socialism.

"In this three-volume series we have identified for three historical events the seat of political power in the United States – the power behind the scenes, the hidden influence on Washington – as that of the financial establishment in New York: the private international bankers, more specifically the financial houses of J.P. Morgan, the Rockefeller-controlled Chase Manhattan Bank, and in earlier days (before amalgamation of their Manhattan Bank with the former Chase Bank), the Warburgs.

The U.S. Has Become a Quasi-Totalitarian State

"The United States has, in spite of the Constitution and its supposed constraints, become a quasi-totalitarian state. While we do not (yet) have the overt trappings of dictatorship, the concentration camps and the knock on the door at midnight, we most certainly do have threats and actions aimed at the survival of non-Establishment critics, use of the Internal Revenue Service to bring dissidents in line, and manipulation of the Constitution by a court system that is politically subservient to the Establishment.

International Bankers Favor Centralized Power

"It is in the pecuniary interests of the international bankers to centralize political power – and this centralization can best be achieved within a collectivist society, such as socialist Russia, national socialist Germany, or a Fabian socialist United States.

"There can be no full understanding and appreciation of twentieth-century American politics and foreign policy without the realization that this financial elite effectively monopolizes Washington policy.

"In case after case, newly released documentation implicates this elite and confirms this hypothesis. The revisionist versions of the entry of the United States into World Wars I and II, Korea, and Vietnam reveal the influence and objectives of this elite.

The Acquisition of Economic Power and Markets

"For most of the twentieth century the Federal Reserve System, particularly the Federal Reserve Bank of New York (which is outside the control of Congress, unaudited and uncontrolled, with the power to print money and create credit at will), has exercised a virtual monopoly over the direction of the American economy. In foreign affairs the Council on Foreign Relations, superficially an innocent forum for academics, businessmen, and politicians, contains within its shell, perhaps unknown to many of its members, a power center that unilaterally determines U.S. foreign policy. The major objective of this submerged – and obviously subversive – foreign policy is the acquisition of markets and economic power (*profits*, if you will), for a small group of giant multi-nations under the virtual control of a few banking investment houses and controlling families.

Foundations Controlled by the Elite

"Through foundations controlled by this elite, research by compliant and spineless academics, 'conservatives' as well as 'liberals,' has been directed into channels useful for the objectives of the elite essentially to maintain this subversive and unconstitutional power apparatus.

"Through publishing houses controlled by this same financial elite unwelcome books have been squashed and useful books promoted; fortunately publishing has few barriers to entry and is almost atomistically competitive. Through control of a dozen or so major newspapers, run by editors who think alike, public information can be almost orchestrated at will. Yesterday, the space program; today, an energy crisis or a campaign for ecology; tomorrow, a war in the Middle East or some other manufactured 'crisis.'

The Manipulation of Society by the Eastern Establishment

"The total result of this manipulation of society by the Establishment elite has been four major wars in sixty years, a crippling national debt, abandonment of the Constitution, suppression of freedom and opportunity, and creation of a vast credibility gulf between the man in the street and Washington, D.C. While the transparent device of two major parties trumpeting artificial differences, circus-like conventions, and the cliché of 'bipartisan foreign policy' no longer carries credibility, and the financial elite itself recognizes that its policies lack public acceptance, it is obviously prepared to go it alone without even nominal public support.

Is the Elite Power Structure a Subversive Force?

"In brief, we now have to consider and debate whether this New York-based elitist Establishment is a subversive force operating with deliberation and knowledge to suppress the Constitution and a free society. That will be the task ahead in the next decade.

"The arena for this debate and the basis for our charges of subversion is the evidence provided by the revisionist historian. Slowly, over decades, book by book, almost line by line, the truth of recent history has emerged as documents are released, probed, analyzed, and set within a more valid historical framework.

The Eastern Establishment Wanted War with Japan

"Let us consider a few examples. American entry into World War II was supposedly precipitated, according to the Establishment version, by the Japanese attack on Pearl Harbor. Revisionists have established that Franklin D. Roosevelt and General Marshall *knew* of the impending Japanese attack and did nothing to warn the Pearl Harbor military authorities. The Establishment wanted war with Japan. Subsequently, the Establishment made certain that Congressional investigation of Pearl Harbor would fit the Roosevelt whitewash. In the words of Percy Greaves, chief research expert for the Republican minority on the Joint Congressional Committee investigating Pearl Harbor:

"The complete facts will never be known. Most of the so-called investigations have been attempts to suppress, mislead, or confuse those who seek the truth. From the beginning to the end, facts and files have been withheld so as to reveal only those items of information which benefit the administration under investigation. Those seeking the truth are told that other facts or documents cannot be revealed because they are intermingled in personal diaries, pertain to our relations with foreign countries, or are sworn to contain no information of value.

Elite Moved U.S. into World War I

"But this was not the first attempt to bring the United States into war, or the last. The Morgan interests, in concert with Winston Churchill, tried to bring the U.S. into World War I as early as 1915 and succeeded in doing so in 1917. Colin Thompson's *Lusitania* implicates President Woodrow Wilson in the sinking of the *Lusitania* – a horror device to generate a public backlash to draw the United States into war with Germany. Thompson demonstrates that Woodrow Wilson knew *four days beforehand* that the *Lusitania* was carrying six-million rounds of ammunition plus explosives, and therefore, 'passengers who proposed to sail on that vessel were sailing in violation of statute of this country.'

"The British Board of Inquiry under Lord Mersey was *instructed* by the British Government 'that it is considered politically expedient that Captain Turner, the master of the *Lusitania*, be most prominently blamed for the disaster.'

"In retrospect, given Colin Thompson's evidence, the blame is more fairly to be attributed to President Wilson, "Colonel" House, J. P. Morgan, and Winston Churchill; this ... elite should have been brought to trial for willful negligence, if not treason. It is to Lord Mersey's eternal credit that after performing his 'duty' under instructions from His Majesty's government, and placing the blame on Captain Turner, he resigned, rejected his fee, and from that date on refused to handle British government commissions. To his friends Lord Mersey would only say about the *Lusitania* case that it was a 'dirty business.'

The Attempt to Install a Fascist Dictatorship in America

"Then in 1933-4 came the attempt by the Morgan firm to install a fascist dictatorship in the United States. In the words of Jules Archer, it was planned to be a Fascist *putsch* to take over the government and 'run it under a dictator on behalf of America's bankers and industrialists.' Again, a single courageous individual emerged – General Smedley Darlington Butler, who blew the whistle on ... Wall Street.... And once again Congress stands out, particularly Congressmen Dickstein and MacCormack, by its gutless refusal to do no more than conduct a token whitewash investigation.

The Eastern Establishment Has Been Subsidizing the Soviet Union for Over 50 Years

"Since World War II we have seen the Korean War and the Vietnam War – meaningless, meandering no-win wars costly in dollars and lives, with no other major purpose but to generate multibillion-dollar armaments contracts. Certainly these wars were not fought to restrain communism, because for fifty years the Establishment has been nurturing and subsidizing the Soviet Union which supplied armaments to the other sides in both wars – Korea and Vietnam. So our revisionist

history will show that the United States directly or indirectly armed both sides in at least Korean and Vietnam.

"In the assassination of President Kennedy, to take a domestic example, it is difficult to find anyone who today accepts the findings of the Warren Commission – except perhaps the members of that Commission. Yet key evidence is still hidden from public eyes for 50 to 75 years. The Watergate affair demonstrated even to the man in the street that the White House can be a vicious nest of intrigue and deception.

Operation Keelhaul Was Part of a Long-Range Program for Nurturing Collectivism

"Of all recent history the story of Operation Keelhaul is perhaps the most disgusting. Operation Keelhaul was the forced repatriation of millions of Russians at the orders of President (then General) Dwight D. Eisenhower, in direct violation of the Geneva Convention of 1929 and the long-standing American tradition of political refuge. Operation Keelhaul, which contravenes all our ideas of elementary decency and individual freedom, was undertaken at the direct orders of General Eisenhower and, we may now presume, was a part of a long-range program of nurturing collectivism, whether it be Soviet communism, Hitler's Naziism, or FDR's New Deal. Yet until recent publication of documentary evidence by Julius Epstein, anyone who dared to suggest Eisenhower would betray millions of innocent individuals for political purposes was viciously and mercilessly attacked.

The Cost of Surrendering Power to the Elite

"What this revisionist history really teaches us is that our willingness as individual citizens to surrender political power to an elite has cost the world approximately two-hundred-million persons killed from 1820 to 1975. Add to that untold misery the concentration camps, the political prisoners, the suppression and oppression of those who try to bring the truth to light.

When Will It All Stop?

"When will it all stop? It will not stop until we act upon one simple axiom: that the power system continues only so long as *individuals* want it to continue, and it will continue only so long as *individuals* try to get something for nothing. The day when a majority of individuals declares or acts as if it wants nothing from government, declares it will look after its own welfare and interests, then on *that* day power elites are doomed. The attraction to 'go along' with power elites is the attraction of something for nothing. That is the bait. The Establishment always offers something for nothing; but the something is taken from someone else, as taxes or plunder, and awarded elsewhere in exchange for political support.

Periodic Crisis and Wars Used to Gain Support for Legalized Plunder

"Periodic crises and wars are used to whip up support for other plunder-reward cycles which in effect tighten the noose around our individual liberties. And of course we have hordes of academic sponges, amoral businessmen, and just plain hangers-on, to act as non-productive recipients for the plunder.

"Stop the circle of plunder and immoral reward and elitist structures collapse. But not until a majority finds the moral courage and the internal fortitude to reject the something-for-nothing con game and replace it by voluntary associations, voluntary communes, or local rule and decentralized societies, will the killing and the plunder cease." (Antony C. Sutton, *Wall Street and FDR*, pp. 173-177.)

6. The Arrogance of Wall Street – the Mexican Peso Bailout

Picture of Robust Growth and Potential

On June 1, 1994, *USA Today* ran a spectacular 16 page advertisement about the dynamic growth and potential of Mexico. With glowing words, Mexico was extolled as an economic and financial market with almost unlimited possibilities for foreign investors. The lead article was entitled, "The Rewards of Reform." A picture of President Carlos Salinas de Gortari of Mexico, President George Bush of the United States and Prime Minister Brian Mulroney of Canada, taken during preparatory talks for NAFTA, was placed prominently on the front page.

The following words, enlarged to add emphasis, were placed under the picture of the three world leaders: "Armed with modernation, liberalization and competitiveness, the Mexican people are ready to follow Salinas into the danger-fraught global market place in search of the treasures offered to good performers by NAFTA, GATT, APEC and the OECD. There is little apprehension about any post-election changes in policy." ("Our World: Mexico", *USA Today Advertising Insert*, June 15, 1994.)

All is Not Well in Mexico

Obviously these words were carefully crafted to placate certain international investors and to create greater confidence in Mexico's ruling oligarchy. However, astute investors knew that not all was well in Mexico. They realized that a major financial crisis was brewing in Mexico and that the peso was about to be devalued. Proponents of NAFTA also knew that the Salinas Administration was not being honest about its future financial instability and the precarious state of the peso. That is why the Clinton Administration set up a secret \$6 billion fund for Mexico to use to bolster the peso. It appears that the White House knew more than it was letting on to the American people and the world. They kept quiet until after NAFTA passed Congress in the fall of 1994. Then the peso fell over 30% creating a panic throughout the financial community.

Smart Investors Began Moving Funds Out of Mexico in 1994

According to Bill Montague, "For months, U.S. investors have been selling Mexican stocks and bonds and moving their money out of the country. To do this, they need to sell pesos and buy dollars. That tended to drive down the peso. Until last week, the Bank of Mexico-Mexico's equivalent of the Federal Reserve – propped up the currency by buying pesos with dollars. But as peso selling increased, the bank ran short of dollars. That forced the Mexican government, on Dec. 20, to let the peso float – to find its own level in the currency markets. The result was something close to panic selling earlier this week. The peso plummeted." (*USA Today*, December 29, 1994.)

The Crash of the Peso

Why did investors move billions of dollars out of Mexico if its future was so promising? In an article entitled, "Mexico's Wake Up Call, Michael Meyer wrote:

"The peso's near collapse, accompanied by soaring interest rates and a crashing Mexican stock market, provided a stunning demonstration that Mexico has far to go in convincing the business world that it has outgrown a past of autocratic politics and erratic economics. The crisis may bring more unrest to a country that has experienced a guerrilla uprising and two political assassinations in the past 12 months, and it will end the U.S. export boom that followed the controversial North American Free Trade Agreement with the United States and Canada. Foreign investors, many of whom had jumped into hot Latin American securities with barely a glance at the risks, are also among the casualties. If they pull out their money, Mexico will have an even tougher time restoring economic growth.

"The tumult leaves a shadow over President Ernesto Zedillo, himself an economist, who took office on Dec. 1. Zedillo's predecessor, Carlos Salinas de Gortari, had all but cured Mexico's inflation by anchoring the wobbly peso to the U.S. dollar. He was aided by foreigners, drawn by interest rates topping 20 percent, who poured so much money into Mexico that the peso stayed strong. But when the dollar inflow slowed last spring, Salinas was left with an ugly choice. Allowing the peso to slide would fuel inflation and tempt the fates. Mexican governments are normally weak near the end of a six-year term, and memories of 1982, when outgoing president Jose Lopez Portillo promised to defend the peso 'like a dog' and then saw it plummet, are vivid. Trying to hold the peso firm, though, would mean hiking interest rates at election time.

"Instead of either unwelcome choice, Salinas's government began using its \$30 billion in foreign-currency reserves to buy up pesos, at times spending \$1 billion a day. Zedillo, sources say, asked Salinas in October to let the peso fall – a request Salinas is said to have flatly rejected. By December 19, reserves were below \$10 billion and falling fast. Zedillo had no choice but to abandon the pretense that 3.5 pesos were worth one dollar. The peso tumbled 70 percent before climbing back to

5 last Friday, leaving carnage from Buenos Aires to Wall Street. The government's silence made matters worse...." (*Newsweek*, January 9, 1995, p. 52.)

The Clinton Administration Rushes to Rescue Wall Street

After the peso crisis in December of 1994, the Clinton Administration went to work to ensure that the global investors who held large segments of Mexican debt would not lose billions of dollars. On January 2, 1995, President Ernesto Zedillo of Mexico announced an emergency economic plan to rescue the plummeting peso. It was reported that: "The emergency economic plan he proposes includes loans of \$18 billion from 'friendly' countries, including \$9 billion from the United States – \$3 billion more than originally pledged." (*USA Today*, January 3, 1995.)

The emergency plan contained a series of loan guarantees from the U.S. Why were these loan guarantees necessary? Mexico had over \$58 billion in Treasury Notes that were due in 1995. Over \$10 billion high-interest Treasury Bills were due on April 1, 1995. The holders of these notes were able to convert the pesos to dollars. However, the Mexican Treasury was empty. That is why the elite financial powers rushed to have the U.S. taxpayers provide \$9 billion to Mexico. The funds were going from the American taxpayers to Washington, D.C., from Washington, D.C. to Mexico City, and from Mexico City to Wall Street in New York City and other foreign investors. The American taxpayers were called upon to bail out the investors in Mexico.

Size of Rescue Package Increases

Mexico's total foreign debt is estimated at \$160 billion and since it didn't have the funds to pay off its notes in 1995, the financial community decided to increase the size of its "rescue package." The \$9 billion in U.S. funds was only the down payment on the Mexican bail out of 1995. According to David Beckwith, head of International Investing at John Hancock Mutual Funds, the Mexican peso crisis has "got the look of total disaster. It's so bad that it defies description." (*USA Today*, January 11, 1995.)

A Peso Meltdown

In an article entitled, "Peso Strips Investor Confidence," John Waggoner and David Craig quoted Mike Majure, portfolio manager at Diaz-Verson Capital Investments, as saying, "It's translating into a meltdown in Latin America. People are just getting out at any price. Everybody is headed for the door at the same time and the liquidity just isn't there." (*USA Today*, January 11, 1995, p. 23.)

Waggoner and Craig pointed out: "The meltdown really is a crisis of confidence in Mexico's government. Mexico's ambitious economic plans were built on getting foreigners to invest in Mexican infrastructure: Plants, factories, toll roads and telecommunications. That infrastructure was expected to boost Mexico's economy

– and help it pay its debts. To get foreign investors into Mexico, the government kept currency exchange rates stable, privatized many government-owned companies and eased restrictions on foreign investment.

"For a long time, the plan worked. *Tesobonos* became a wildly popular investment for U.S. mutual funds and other institutional investors. Currently, there are about \$26 billion in *Tesobonos* outstanding, \$17 billion outside Mexico. 'They're mostly held in the U.S., by mutual funds, banks, private investors. Nearly everyone has dipped his toes in at some point,' says Paul Ghaffari, a money manager at Morgan Stanley.

"And Mexican stocks became a staple of U.S. mutual funds – not only funds that invested overseas, but also some garden-variety U.S. stock funds. In September, Capital Management and Research, the USA's fourth-largest mutual fund company, was the biggest holder of Telefonos de Mexico, the Mexican telephone company. It held 9.8 million shares, or 1.9% of the outstanding shares, Bloomberg Business News says. Fidelity, the USA's biggest fund group, owned 3.4 million shares, or 0.7%. Telefonos is down 31% since Dec. 19.

"While foreign money was flowing in, the Mexican stock market boomed. The value of Mexico's 190 publicly traded stocks soared from \$140 billion to more than \$200 billion in 1993. Mexico's market is dwarfed by the USA's, which has more than 5,000 actively traded stocks and a market capitalization – total value of all those stocks – well over \$5 trillion. But Mexico is Latin America's biggest stock market, twice as big as Brazil's \$99 billion market.

"The frenzy of growth stopped short when Mexico devalued its currency. Now, Mexican and foreign investors no longer believe the government's promises that it will stabilize the peso. Confusion and distrust permeate Mexican society: 'Right now, no one really believes what the government is saying,' says Guillermo Saenz Martinez, chief investment strategist for INFRA, a large Mexican manufacturing company...." (*USA Today*, January 11, 1995, p. 2B)

Over \$8 Billion Fled Mexico in Nine Days

In an article entitled, "Mexico's Crisis: Who in Latin America is Next?" Georgie Anne Geyer stated: "When the crisis started in mid-December, it was bad enough: When Zedillo nudged the peso downward and let it float against the dollar, the Mexican stock market plummeted. As fund managers from New York to London dumped Mexican securities, the peso at one point lost 40 percent of its value. Within nine days, 12 percent of Mexico's total foreign investment (roughly \$8 billion) reportedly had fled the country.

"Now the situation is, day after day, worsening (despite a mid-week rebound). The headlines are 'Latin American Prices Plunge' and even 'Budget Fears Hit World Currencies.

"No one explained it better than Dr. Riordan Roett, senior political analyst for the Chase Manhattan Bank, who told analysts here that, in the financial markets, 'the perception is that something is fundamentally wrong with Mexico. This is not NAFTA; this is not bailing them out of their debt problems in 1982. This is a situation that involves millions of investors who are now rapidly selling.

"The Latin American stock funds are down 32 percent since Dec. 15. Stocks are plunging in Mexico. It is no longer a question of only Mexico but of all of the 'emerging markets. Mexico was the country perceived to be the most predictable. Now, the perception is that the financial markets are frozen in Mexico." (*Universal Press*, Syndicate, January 13, 1995.)

Rescue Package Increased to \$40 Billion

On January 13, 1995, John Waggoner reported that, "The Mexican stock market and the press rallied again Thursday, buoyed by news that the U.S. is putting together a massive aid package.

"President Clinton and congressional leaders pledged to 'do what is necessary to restore financial confidence in Mexico without affecting the budget at home.' The United States is expected to put together loan guarantees worth \$25 billion to \$40 billion....

"But Mexico's problems are far from over. High interest rates probably will send the country into a recession. The government expects 20% inflation this year. High inflation and a tough recession could send the Mexico banking system to the brink of disaster." (*USA Today*, January 13, 1995, B1.)

In his article, Waggoner quotes Steve Dexter, co-portfolio manager of Kemper International Fund as saying, "We haven't seen all the bombs blow up yet." (*Ibid.*)

Mexico Slips to Third World Status

Mexico's financial crisis is far deeper than the Clinton Administration is willing to admit. And the elite in New York are as quiet as possible in order not to awaken the American people to the extent of the financial mismanagement of the ruling oligarchy in Mexico. In less than a year, Mexico has slipped from First World status to a risky, Third World country, at least, in the eyes of foreign investors.

On January 16, 1995, *Business Week* noted, "The peso debacle has once again revived doubts about whether hitching together such vastly different economies as the U.S. and Mexico under the North American Free Trade Agreement will ever really pay off. (*Business Week*, January 16, 1995, p. 43.)

Two Groups Are Victimized by Peso Crisis

It is apparent that there are two groups that are the victims of the Mexican peso crisis. First, are the Mexican people. Their wages and savings have been slashed 30%. Second, are the less astute investors who are part of smaller mutual funds or as single investors were not prepared for the massive drop in stock values (30%) that occurred when the peso fell.

The Winners of the Peso Crisis

It is interesting to note that there are three winners in the peso devaluation. First, are the investors who hold Mexican government debt notes. The massive rescue package put together by the Clinton Administration and other international financial institutions ensures that they do not lose money. Second, the large U.S. multinational corporations that moved factories into Mexico. The pay of Mexican workers was cut, in U.S. dollars, by 30%. Profits from U.S. corporations which moved to Mexico will increase dramatically. The third winners are the large international bankers and investment firms that pulled billions of dollars out of Mexico at just the right time and who are now able to pick up tremendous bargains for a fraction of their original cost or investment.

This latter group will reap billions and billions of dollars in profits from President Zedillo's new economic and financial reforms. Global investors are being offered opportunities to invest in ports, railroads, phone services and satellite telecommunication systems.

Restructuring of Mexico's Debt

The large investment bankers, such as J. P. Morgan and Citicorp, are being called upon by Guillermo Ortiz, the new Finance Secretary to help restructure Mexico's government debt.

As noted in *Business Week*, "Ortiz' mandate is to shift Mexico's source of funding from volatile short-term securities to longer-term investment. For starters, he has turned to Wall Street investment banks to help him design a new series of dollar-denominated notes. They will be offered in exchange for billions of dollars' worth of outstanding *Tesobonos*, which are short-term debt instruments sold in dollars but payable in pesos at the current rate. Since the currency crisis began, investors have shown barely any interest in *Tesobonos*, even though their yields have shot past 12%. 'That's an absurdly low rate in this currency environment,' says Bear Stearns & Co. Managing Director Geoffrey E. J. Dennis.

"Payoff. Investment bankers and money managers think that new notes will have maturities of two to five years and will pay substantially more than U.S. Treasuries – perhaps as much as 20% at the outset. Some fund managers want the

notes to be backed by collateral, say a portion of Mexico's oil-export revenues or other hard-currency cash flows.

"Ortiz is also expected to move the government toward more borrowing from commercial banks to replace short-term financing by fickle mutual- and pension-fund managers. 'The banks can take a longer view on sovereign credits,' says Mark J. Siegel, head of emerging markets at Putnam Investment Management in Boston. The banks, however, may be looking at a lucrative payoff. Some Wall Streeters think that J. P. Morgan and Citicorp, among others, will reap handsome profits in coming years by lending to Mexico while taking major roles in the new privatization programs.

"But Ortiz will probably have to expand privatization beyond the skimpy menu Zedillo provided. Most of what Zedillo offered was already in the pipeline. The one new wrinkle being discussed, allowing 100% ownership of Mexican banks by foreign institutions, which are currently limited to 30%, isn't arousing much interest. Any bank available would probably be riddled with bad loans. But interest is growing in other, more attractive, sectors. Zedillo will come under continued pressure to open up petrochemicals, gasoline marketing, refining and electricity. (*Business Week*, January 16, 1995.)

The Crash Signals the Time to Buy Mexican Stocks

In an article entitled, "Bargain Hunters, Lock and Load, ("Mexican Stocks Will Become Ever-Easier Prey") Joan Warner stated: "Buy signal. That's how professional contrariness, like Franklin Templeton Fund manager Mark J. Mobius, feel about many Mexican stocks right now. To Mobius, a market crash is often a buy signal and in Mexico's case he is even looking at companies with severe peso exposure. 'Our feeling is that a lot of the banks are undervalued.'" (*Business Week*, January 16, 1995, p. 55.)

Rescue Package Increased to Placate Wall Street Investors

On January 17, 1995, the American people learned that the "Mexican Bailout Package" has grown from \$18 billion to \$40 billion. Martin Crutsinger states: "Faced with the prospect that a collapsing Mexican economy could have serious economic and political fallout in this country, President Clinton has dramatically increased the potential U.S. support.

"The big question: Will it work?

"The short answer is probably yes, for a while at least. Even with details of the plan still sketchy, Mexican financial markets rallied again Friday, posting a third straight day of gains and recouping a bit of their big losses.

"But even if the promised U.S. loan guarantees are enough to ease the short-term cash squeeze, Mexico will still face huge uncertainties down the road brought on by the sharp devaluation of its currency.

"That bleak outlook includes skyrocketing inflation from a peso that has lost more than one-third of its value since Dec. 20, and quite likely a recession as the Mexican government's economic austerity program begins to pinch.

"Clinton is facing fallout as well. Before Mexico's economic meltdown, the president had proudly touted the North American Free Trade Agreement as one of his biggest victories, providing the United States with a stable and growing market for its products in Mexico and Canada.

"But the weaker peso means American products are now one-third more expensive in Mexico while Mexican products are suddenly cheaper – and more appealing for Americans.

"Thus, America's trade surplus with Mexico, which had already shrunk to \$2 billion last year, is likely to disappear altogether and turn into a trade deficit in 1995 as U.S. products are priced out of the Mexican market. So much for big gains in American exports under NAFTA.

"'This so-called free-trade agreement is proving to be anything but free for U.S. taxpayers and working families,' Rep. Peter Defazio, D-Ore., a staunch NAFTA opponent complained Friday. 'It's cost tens of thousands of U.S. jobs already and is now well on its way to becoming the biggest taxpayer bailout for banks and foreign interests since the savings and loan scandal.'

"Such complaints will intensify as the administration lobbies the loan guarantees through Congress in coming weeks.

"But in the end, the expanded rescue package should win support. House Speaker Newt Gingrich, R-Ga., and Senate Majority Leader Bob Dole, R-Kan., joined in Thursday night's joint statement with the president pledging to 'do what is necessary to restore financial confidence in Mexico without affecting the current budget at home.'

"Treasury Secretary Robert Rubin and Federal Reserve Chairman Alan Greenspan were on Capitol Hill Friday, briefing more than 100 senators and House members behind closed doors on just what that grand promise entails.

"While administration officials have given a wide range of between \$25 billion to \$40 billion in possible loan guarantees, lawmakers who attended the briefing said they believed \$40 billion was the outside limit and that Mexico will need much less....

"The guarantees are expected to be used to help Mexico meet obligations on \$28 billion in short-term debt coming due this year while bucking up the confidence of international investors that Mexico can work its way out of the immediate difficulties.

"While economists think the U.S. package will achieve this short-range goal, they still worry about the long term. One big worry is whether the belt-tightening will spawn riots and major strikes from an outraged Mexican population. (The Associated Press, January 17, 1995.)

The Cause of the Peso Crisis

Bill Montague presented an excellent summary of the peso's dramatic fall. In an article entitled, "What Caused Mexico's Crisis," he stated: "At the heart of Mexico's peso crisis: That nation's appetite for imported goods. To pay for them, Mexico must borrow from foreign investors. But it also must repay those debts, with interest. Result: Mexico has a huge payments shortfall, known as a current-account deficit. This reached \$28 billion in 1994 – 8% of Mexico's gross domestic product. Proportionately, that's four times bigger than the USA's own deficit.

"Worse, most of Mexico's debt is in short-term securities, including government notes, called *cetes* and *Tesobonos*. Most of that debt matures in 90 days or less, making it easy for foreigners to pull money out.

"During the early 1990s, this wasn't a problem. Foreigners rushed to lend to Mexico, drawn by short-term interest rates of up to 30%. That supported the peso.

"But early in 1994, a rebellion in the southern province of Chiapas rattled investor confidence. Meanwhile, the Federal Reserve began pushing up U.S. interest rates. Bond yields soared globally, making Mexican debt less attractive. Foreign investors began to sell Mexican assets, putting pressure on the peso. Mexican officials tried to avoid a devaluation by buying pesos.

"By mid-December, the game was up. Renewed unrest in Chiapas triggered flight by foreign investors. Down to its last few billions in dollar reserves, the Bank of Mexico – Mexico's Fed – had to let the peso go." (*USA Today*, January 17, 1995.)

Wealthy in Mexico Began Moving Billions Out of Mexico in 1994

On January 19, 1995, Marcia Stepanek of the New York Times Service wrote an interesting article entitled, "What Mexico's Peso Mess Means to the U.S." In the article we learn that NAFTA is in peril and that the wealthy in Mexico began moving large sums of wealth out of Mexico long before the peso crisis. Stepanek stated: "Mexico's peso mess clouds the promise of the North American Free Trade Agreement, economists say.....

"NAFTA is in peril,' says Nora Lustig, a Bookings Institution analyst. 'If the peso stays weak for long, there'll be precious few American exports to Mexico.

"Adds Martin Rojas of the U.S.-Mexico Chamber of Commerce: 'It's a time of transition for many American investors in Mexico. (U.S. businesses) are stopping, reassessing, making decisions on how to cut back to compensate for it all....'

"Here are some questions and answers about Mexico's peso crisis....

"QUESTION: What do President Clinton and congressional leaders want to do to help Mexico?

"ANSWER: They are designing a plan for the United States to co-sign up to \$40 billion in new loans to Mexico, thereby increasing the odds that investors would agree to lend Mexico the cash it will need over the next 12 to 18 months – at affordable rates – in order to pay off its bills. This is called a loan guarantee program.

"Q: What is a loan guarantee?

"A: With a loan guarantee, the United States isn't lending any money to Mexico. But it is lending Mexico its good credit rating, to help convince bankers to lend Mexico more money. It's the same concept as a parent co-signing a teen's new-car loan. If the teen somehow can't make the payments over time, the parent must do so. In Mexico's case, the United States would agree to repay investors up to \$40 billion in new commercial loans to Mexico if Mexico should default on them.

"Q: Is U.S. tax money at risk here?

"A: Very indirectly. In fact, the White House hopes to make money off the deal by requiring Mexico to pay the U.S. Treasury some \$10 billion or more right away in fees for the privilege of getting the loan guarantees.

"For added protection, the administration is thinking about asking the Mexican government to guarantee repayment of the loans from revenue of Patros Mexicanos – Mexico's state-owned oil company, commonly referred to as PEMEX.

If PEMEX couldn't pay – and this is unlikely, given the company's \$7 billion a year revenues – then U.S. taxpayers would have to pay.

"Q: Has the United States bailed out others before?

"A: Yes. Perhaps the most famous instance was the 1980 bailout of the Chrysler Corp., where the government guaranteed loans and, in return, got stock options

held by a third party. The deal paid off for the Treasury. Chrysler rebounded back to profitability, resulting in the government ultimately auctioning off its options for a profit of \$311 million.

"Uncle Sam also has helped to bail out New York City, Conrail and Lockheed Corp. In 1992, the Bush Administration under-wrote \$10 billion in loans to Israel, to help pay for housing construction to meet a tide of Soviet immigrants....

"Q: How did the crisis come about?

"A: When the Federal Reserve began raising U.S. interest rates last year, investors began to abandon developing countries such as Mexico and take advantage of the higher yields on the less risky U.S. bond market. That's part of it.

"Economists also blame the Mexicans. In the past year, wealthy Mexicans shifted much of their wealth out of the country, while middle-class Mexicans went on a buying spree, much of which involved U.S.-made consumer goods.

"To accommodate this flow of capital, the peso should have dropped in value. But because Mexico's politicians had built their economic policies and election campaigns around a strong currency, the central bank depleted its foreign currency reserve in an ill-fated effort to prop up the peso. When the reserves finally ran out, just before Christmas, the government had to devalue the peso by about 40 percent. That triggered the current crisis.

"Economists say now that Mexico should have devalued its peso much more gradually – and should have started doing so long ago. The Mexican government, to cope with the crisis, now is cutting government spending, controlling wages and prices, and raising interest rates – essentially engineering a recession. It will take several years to recover. (New York Times News Service, January 18, 1995.)

Opposition to Wall Street Bailout Emerges in Congress

Although it took a few days for the new members of Congress to get situated in Washington, D.C., by January 20, 1995, a solid opposition began to arise against the Mexico Bailout Package. A ground swell of opposition had also arisen in America where over 80% of those surveyed opposed the expensive bailout of Wall Street and its fraternity around the world.

On January 20, 1995, we learned in the cover story that, "Mexican Stocks Drop on Loan Fears." Bill Montague noted that: "Stock and bond markets tumbled across Latin America Thursday on fears a \$40 billion package of U.S. loan guarantees for Mexico won't be approved by Congress.

"Mexico's Bolsa stock index plunged 104 points, or 4.8%, as doubts grew about the Clinton administration's ability to push through the loan plan, designed to shore

up Mexico's battered peso. Since it was decoupled from the dollar Dec. 20, the peso has fallen 37%....

"Triggering the slump: further delays in Washington. In the Senate, Majority Leader Robert Dole, R-Kan., said the Mexico loan package won't be considered until Democrats stop blocking a vote on another, unrelated issue.

"The markets are worried that if it keeps getting delayed, it will never come to a vote at all,' says Geoffrey Dennis, chief Latin American economist for Bear Stearns.

"Analysts say failure to approve the loans could destabilize world financial markets. 'This has huge implications, far beyond Mexico,' says David Hale, chief economist for Kemper Financial.

"The big risk: Sky-high interest rates in Mexico are pushing the country's banks to the brink of collapse. 'Their bad-loan numbers are going off charts,' Dennis says.

"If one or more big Mexican banks defaulted, it could threaten Eurodollar lenders – offshore banks that are neither regulated nor insured by the U.S. government.

"Wall Street insiders say Mexican banks and corporations owe foreigners close to \$30 billion in Eurodeposits, commercial paper and other short-term dollar liabilities. That's on top of about \$18 billion in *Tesobonos* – government notes payable in pesos but indexed to the dollar – held by foreigners. Defeat of the U.S. loan package would put those payments at risk.

"If (the loan package) doesn't go through, there's going to be a meltdown,' warns David Gilmore, an analyst with Foreign Exchange Analytics." (*USA Today*)

Mexico Bailout Package in Serious Trouble

One week later, on January 27, 1995, we learned that the Mexico Bailout Package was in serious trouble on Capitol Hill. The American people, who had flexed their political muscle on November 4, 1994, were adamantly opposed to the Clinton plan which had now risen to \$40 billion.

In an article entitled, "Support for Mexico Aid Erodes," Juan J. Walte and Judi Hasson wrote:

"President Clinton and Mexico got good news from international bankers Thursday, but few encouraging signals from a Congress increasingly suspicious of a \$40 billion U.S. guarantee to rescue the peso.

"Sounds are being heard from the president and others in the administration, sounding remarkably like Chicken Little's frantic declaration about 'the sky's falling' if Congress doesn't immediately approve this deal," said Senate Foreign Relations chairman Jessie Helms, R-N.C.

"Helms was addressing Treasury Secretary Robert Rubin, who minutes later announced the International Monetary Fund, in its largest package ever for a single country, tentatively agreed to extend \$7.8 billion in loans to Mexico.

"This is a historic event," said Rubin of the IMF deal.

"Clinton needs all the help he can get because the outlook for his package is not good. The vote could be delayed into early or even mid-February.

"One reason Clinton's plan is in trouble is that neither Democrats nor Republicans are rallying around it. Democrats are among its strongest foes.

"What support there was (for the U.S. rescue plan) is collapsing in a dramatic fashion," Sen. J. James Exon, D-Neb., told Federal Reserve Chairman Alan Greenspan Thursday.

"Democrats are worried that the administration is bailing out wealthy investors. Republicans are concerned that Mexico agree to put up its oil reserves as collateral, in case of default.

"Amid the wrangling, Sen. Ernest Hollings, D-S.C., warned that conditions extracted in return for the U.S. loan guarantees risks offending Mexico's sense of national sovereignty....

"Sen. Dianne Feinstein, D-Calif., summed up the administration's problem. 'I know of no constituent in my state who is for it,' she said." (*USA Today*, January 27, 1995.)

President Clinton Bypasses Congress and Issues an Executive Order

On January 31, 1995, President Clinton announced a new plan to rescue Mexico and Wall Street. The new plan called for the Administration to make an end run around Congress, ignore the will of the American people and use the power of the Presidency to issue an Executive Order stating that the Administration would take \$20 billion from the U.S. Exchange Stabilization Fund. This action was brought about because former Goldman Sachs Chief, Robert Rubin, now the Treasury Secretary, and his friends in New York realized that the Bailout Package was dead on Capitol Hill.

A Dow Jones news article released on January 31, 1995, stated: "President Clinton outlined a package of \$47.5 billion in financial support for Mexico that could be activated by executive order, without approval from Congress.

"In a speech to the National Governor's Association, Clinton said that since leaders of Congress had told him that they could not approve a legislative package to support Mexico loan guarantees, he had decided to act on his own.

"'We must act now,' said Clinton. 'It has gotten worse day by day.'

"He said he was acting under his executive authority in seeking the loans and support for Mexico because 'we cannot risk further delay.' Congress will 'not act immediately, and therefore will not act in time,' said Clinton.

"He said the U.S. would reserve a \$20 billion share from the U.S. Exchange Stabilization Fund to support Mexico, which he can do without authorization of Congress.

"He also said that \$17.5 billion would be provided by the International Monetary Fund and an additional short-term lending facility of \$10 billion from the Bank of International Settlements.

"That means that in the aggregate we will have an action that is potentially even more aggressive than the \$40 billion one I proposed, with more of the load being taken by the international institutions,...but with a significant part of the burden being taken by the U.S.," said Clinton. (*Dow Jones News*, January 31, 1995.)

The stage was not set for an even larger battle on Capitol Hill over the Mexican Bailout Package as the "Arrogance of Wall Street" shone brightly in Washington, D.C. as Secretary Rubin announced the elite's new plan to use taxpayers money to bailout Wall Street investors and their colleagues around the world.

Bailout Package Increased to Over \$40 Billion

On February 1, 1995, the Associated Press revealed that, "The total value of the package is nearing \$50 billion, including about \$23 billion that had already been committed....

"Clinton unveiled the new aid package, which does not require congressional approval, after the \$40 billion in loan guarantees he proposed to Congress on Jan. 12 with the back of its Republican leaders ran into a firestorm of criticism." (Associated Press Article, February 1, 1995.)

The new bailout plan consisted of the following contributions: (1) U.S. – \$20 billion; (2) IMF – \$17.8 billion; (3) Central Banks and BIS – \$10 billion; (4)

Bank of Canada – \$1 billion; (5) Group of Latin American Countries – \$1 billion.

Wall Street Applauds Bailout

On February 5, 1995, we learned from Clyde H. Farnsworth that, "Financial leaders of the seven leading industrial countries [U.S., Japan, Canada, France, Italy, Germany and Britain]... expressed 'full satisfaction' with American led efforts to rescue the Mexican economy, but they said they wanted international organizations to improve their ability to forestall similar crisis....

"The International Monetary Fund, which is supposed to provide early warning of financial crisis, has been criticized for failing to anticipate the difficulties in Mexico. The ministers said they had discussed the need for the monetary fund and the World Bank to improve their ability to detect problems early.

"U.S. Treasury Secretary Robert Rubin said Saturday that the problem was the almost instantaneous flows of capital that takes place in today's financial markets.

"He said the IMF and World Bank, sister organizations that have piloted the world's economic system for a half-century, 'need to be as modern as the world we live in.' (New York Time News Service, February 5, 1995.)

Once again the elite are using a crisis to argue for strengthening of international institutions.

Congresswoman Marcy Kaptur Requests White House Documents

On March 2, 1995, the U.S. House of Representatives, under the leadership of Representative Marcy Kaptur, D-Ohio, introduced a resolution calling upon the Clinton Administration to provide Congress with a detailed list of documents concerning the peso debate and the bailout of Wall Street investors. Key legislators were furious over President Clinton's efforts to bypass Congress through his January 31, 1995 executive order which provided Mexico with a credit line of \$20 billion from the U.S. Treasury Exchange Stabilization Fund.

The Associated Press reported: "Opponents of President Clinton's financial rescue mission for Mexico won their first vote in the House and are vowing to continue fighting until they reverse the deal.

"A month after Clinton bypassed a reluctant Congress and issued an executive order extending a \$20 billion credit line, the House voted 407-21 Wednesday night to ask him to turn over within 14 days a long list of documents concerning the rescue effort.

"Members of Congress should not have had to fight this hard or wait this long to achieve this first vote on a matter of such profound economic and political consequences to our people and to our continent,' said Rep. Marcy Kaptur, D-Ohio, sponsor of the resolution.

"So far, House leaders have blocked any overt challenge of the rescue from reaching the floor.

"But a rebellious group of GOP freshmen, led by Rep. Steve Stockman of Texas, planned to ask the House Republican caucus today to endorse a bill that would cut off Mexico's credit line absent congressional approval.

"This Congress is responsible to the American people and we have been left out of the process,' Stockman said. 'The (Mexican) government is corrupt...and we don't need to stabilize it with American dollars.'

"Senior Republicans favor allowing the House to vote on a non-binding resolution disapproving of the administration's handling of the rescue.

"Under Clinton's Jan. 31 executive order, the United States has provided Mexico with the credit line to a Treasury fund established to stabilize the value of the dollar.

"It's part of a \$52 billion package, including support from the International Monetary Fund and other sources, aimed at helping Mexico restore confidence in the peso, which has plunged roughly 40 percent since Dec. 20.

"Clinton invoked his executive authority after it became apparent that he faced a lengthy battle with Congress over a \$40 billion aid bill that the administration had proposed originally.

"Wednesday's resolution, which is not binding, asks for a legal opinion concerning the president's authority to use the stabilization fund without congressional approval, details of negotiations leading to the agreement and information on Mexico's ability and obligation to repay.... (Associated Press, March 2, 1995.)

Clinton Administration Deceived Congress and the American People

During the long and heated debates over passage of NAFTA, the proponents extolled the virtues of uniting our economy with Mexico and Canada. Mexico's elite oligarchy who have ruled the nation with an iron fist for 75 years were touted as paradigms of virtue. The Clinton Administration even promoted former Mexican President Salinas as head of the new World Trade Organization. Then came the peso devaluation, the crash of Mexico's stock market and chaos throughout the country. What happened? What changed? The answer is that

nothing changed. The Clinton Administration was simply taking its lead from Wall Street, who control the Executive Branch and key members of Congress in Washington, and promote NAFTA, the World Trade Organization and the Bailout of Wall Street. In the process a great deal of deception was going on by the Administration and the backers of NAFTA. Wall Street financiers, President Clinton and his colleagues along with key members of Congress were well aware of the dark side of Mexico and its elite oligarchy. They pushed NAFTA and the Wall Street Bailout to protect their own selfish goals of profits without principle. However, it is now getting more difficult to keep secrets and various organizations opposed to a world order led by an elite oligarchy in New York, London, Paris, Frankfurt and Tokyo are getting more adept at informing the American people of the real goals and objectives of this powerful fraternity.

Mexico – A World of Greed and Intrigue

In an article on March 13, 1995, entitled, "The Spreading Scandal," Kevin Fedarko wrote: "Like his princely predecessors, Carlos Salinas de Gortari was accustomed to the sycophantic treatment accorded Presidents – and former Presidents – of Mexico. So it must have come as a shock when a visitor sent 'as a courtesy' by current President Ernesto Zedillo Ponce de Leon showed up unannounced at Salinas' Mexico City house last Tuesday morning and began ringing the front doorbell. The high-level official, laden with documents, tapes and videos, was bringing evidence that a dramatic new lead had surfaced in the investigation into the murder of one of Mexico's most powerful politicians, Jose Francisco Ruiz Massieu, who was gunned down last September outside a Mexico City hotel.

"Carlos Salinas ought to have been pleased to learn of the breakthrough in capturing the alleged 'intellectual tutor' of the assassination. Until, that is, the ex-President learned that agents were converging on the house of the murdered man's former wife, Carlos Salinas' sister Adriana, to arrest the suspect: the ex-President's older brother, Raul....

"Minutes later, Salinas broke with a long-standing tradition that requires former Presidents to refrain from publicly criticizing their successors, and telephoned a popular pro-government news program to issue an emotional appeal. Saying nothing about his brother, he denounced the Zedillo government for the 'errors of December,' an unmistakable reference to his successor's disastrous peso devaluation, which sent the economy into a tailspin. While Salinas' statement transfixed Mexicans with its breach of political decorum, it did little to restore the reputation of the former President....

"On Wednesday, Salinas formally withdrew his now hopeless bid to preside over the new World Trade Organization, relinquishing a cherished ambition to become an international czar. And on Friday, in an act that summed up his political

decline, Salinas fell back on a tactic normally reserved for those who have no other leverage: the former President began a fast, temporarily called it off and then resumed it.

"For Carlos Salinas, news of the arrest of his brother only further diminished the already fading legacy of a President who had expected history to applaud him for transforming Mexico's state-run economy into a free-market wonder – but who was now widely blamed for the crippling financial crisis. For a country where family and political ties have long been held sacrosanct, Zedillo's willingness to slash those ties and affirm the primacy of law came as a bold and welcome attempt to end the old ways. 'Let it be clear,' declared the President on Thursday. 'Nobody can be above the law. In Mexico, impunity has ended....'" (*Time*, March 13, 1995, pp. 48-50.)

Former President Salinas Flees Mexico

On March 14, 1995, we learned that former Mexican President Salinas had fled his country on a corporate jet and was in the United States. In an article entitled, "Such an End to Salinas Revolution," Juan J. Walte and Maria Puente write: "Carlos Salinas de Gortari's stunning and sudden fall from grace reflects the vulnerability of Mexico's once-stable political system.

"When he was president of Mexico for six years beginning in 1988, Salinas lived at the peak of prestige and praise, applauded at home and lauded abroad as a democratic reformer and an apostle for the free market.

"Now, the boos are so ferocious he fled the country, leaving behind an international peso crisis, a double-murder conspiracy plot and drug cartel connection.

"The White House confirmed Monday that Salinas is in the USA, entering last Friday through Brownsville, Texas, on a corporate jet.

"The sight of a former Mexican ruler, a man who while in office had near-imperial powers, sneaking off into political self-exile has not happened in Mexico for at least 60 years.

"In Mexico City, the main question Monday was whether Salinas was pushed out by his hand picked successor, President Ernesto Zedillo.

"Salinas, speaking through his private office in Mexico City, denied he was seeking political exile. He said he was merely visiting New York on business and plans to travel to other countries soon.

"Whatever the case, 'not even the worst purveyor of gloom and doom could have predicted such an end to the Salinas revolution,' says Jorge Castaneda, one of Mexico's leading politician commentators, in the current issue of *Newsweek*.

"It could also mark the beginning of the end of the Institutional Revolutionary Party's monopoly on power.

"The party emerged from the 1910-1920 Mexican Revolution. It has ruled Mexico for the last 66 years in a style combining elements of a European totalitarian regime, Latin American authoritarian *caudillismo* and a big-city U.S. political machine.

"The PRI is now in the midst of a power struggle between the old guard and the younger reformers, between the 'dinosaurs' and the 'technocrats.'

"Ironically, most of the key protagonists in this Mexican drama are considered reformers, including Salinas, Zedillo, assassinated PRI candidate Luis Donald Colosio, and murdered PRI leader Jose Francisco Ruiz Massieu.

"The same cannot be said for Salinas' brother Raul Salinas and Ruiz Massieu's brother, Mario.

"Raul Salinas, a prominent figure in business and PRI circles, is now in a maximum security prison outside Mexico City awaiting trial on charges of masterminding Ruiz Massieu's murder.... (*USA Today*, March 14, 1995.)

Mexico After NAFTA

On March 17, 1995, Craig Torres and Paul B. Carroll reported that "During the 1988-1994 term of Mr. Salinas, foreign investors poured more than \$100 billion into the economy, so confident were they that Mexico was an excellent long-term bet....

"Of course, a good portion of the investment turned out to be 'hot money' in stocks and bonds that could vanish virtually overnight.

"Some 80% of the investment in Mexico was in stocks and bonds rather than in something permanent....

"Nearly 50 million Mexicans remained in poverty while Mexico went from two billionaires to two dozen....

"And Mexico's economy became an open, free-market economy through the North American Free Trade Agreement and such reforms as the sale of \$22 billion in State-owned businesses." ("Mexico's Mantra for Salvation: Export, Export, Export", *Wall Street Journal*, March 17, 1995, p. A7.)

It would appear that the vast sums of money flowing over the past six years into Mexico were not going into the improvement of Mexico and its economy, but into the hands of the elite oligarchy who preside over Mexico's government and national resource based companies.

Senator D'Amato Seeks to Freeze U.S. Taxpayers Money from Being Sent to Mexico

On March 30, 1995, President Clinton and his colleagues on Wall Street learned that opposition to the Wall Street Bailout was intensifying as Senator Alfonse D'Amato introduced an amendment aimed at stopping the President from fleecing the American taxpayer. The Associated Press reported:

""Challenging President Clinton as well as their own party leaders, Senate Republicans tried Thursday to block most of the \$20 billion the United States has pledged to help stabilize the Mexican economy.

"The chief sponsor, Sen. Alfonse D'Amato, R-N.Y., said the aid has been a waste of taxpayers' dollars and complained it was going to 'a corrupt government' peopled by 'narco dealers.'

"Democrats said halting the aid would jeopardize Mexico's already teetering economy, roil financial markets and ultimately hurt the United States. Lawmakers from both parties said the provision seemed to have strong support, but the White House and Democrats were hoping Senate GOP leaders would postpone a vote.

"Senate debate began after House Republicans defeated a movement within their own ranks to bring similar legislation to a vote in that chamber.

"Because of that decision by House Republicans – and because the Senate measure was an amendment to a spending-cuts bill the Clinton administration was likely to veto anyway – the immediate impact of the Senate provision was unclear.

"But the Senate move was a direct challenge to Clinton, who engineered the Mexican bailout earlier this year, by eventually forcing changes in the plan. And it represented a rebellion against Senate Majority Leader Bob Dole, R-Kan., and House Speaker Newt Gingrich, R-G., who had backed the financial arrangement.

"The provision would prevent the expenditure of more than \$5 billion for the bailout – the amount Mexico has already received – without congressional approval. The aid has been controversial with lawmakers, and it would be difficult in the current climate for Clinton to win the assent from Congress.

"'Maybe the president doesn't understand the hard-working American people don't want their money being used in this manner,' said D'Amato, chairman of the Senate Banking Committee. 'But I do.'" (Associated Press, March 30, 1995.)

Mexican Bailout is Nearing Failure

On April 2, 1995, it was reported that: "Already the cash-starved Mexican government has used \$13 billion of a total \$50 billion aid package, including more than \$5 billion from the U.S. Treasury, to pay off billions in debts it ran up in a risky financial strategy that collapsed in December.

"Most of those investors – a mix of rich Mexicans, Americans and other foreigners – have sept up their hefty profits and immediately transferred their money out of the country....

"No one has more at stake in making the bailout work than President Clinton. By circumventing Congress and using the Treasury's Exchange Stabilization Fund to issue the loans – a highly unusual use of money normally intended to stabilize the dollar – Clinton alone will be blamed if the rescue effort falls apart.

"Moreover, Rubin and other members of the administration are scrambling to cut off an attack by Sen. Alfonse M. D'Amato of New York, who tied up the Senate for most of Thursday with a proposed amendment that would prevent the administration from dispersing anything beyond the \$5.2 billion that Washington already has sent to Mexico....

"'Mexico has collapsed already,' D'Amato argued in a telephone interview Friday. 'The rescue plan has failed, and we are just perpetuating a myth if we think we are helping anyone except rich investors, who the United States has saved while everyone else in Mexico starves.'

"D'Amato, who is chairman of the Senate Banking Committee, knows he does not have to pass his bill to seriously wound the administration's effort.

"With considerable political theatrics, D'Amato has been leading an investigation that has come to be called: 'Who lost Mexico?' For weeks, he has been arguing with the administration over demands for thousands of pages of classified documents.

"An agreement has been reached, but it is a sensitive issue at the White House, because the papers include U.S. warnings of peril that came in the weeks before president Clinton publicly hailed Mexico as a 'model' for emerging markets around the world." (New York Times News Service, April 1, 1995.)

Main Street USA Bails Out Wall Street USA

The above articles amply illustrate that Main Street USA is being called upon to guarantee that Wall Street investors and their fraternity members around the world receive their debt payments on time. It is an incredibly open, brazen act of arrogance and plunder. Only Wall Street would dare to pull something like this off.

Only Wall Street has the power to control the Executive Branch of the U.S. Government and key Congressional leaders. Wall Street and their friends in Washington, D. C. duped Congress into passing NAFTA, then GATT and now have generated \$50 billion in loan guarantees, of which came from taxpayers in different nations.

Congressional Opposition to the Mexican Peso Bailout

Let us now look at several statements made by Congressional leaders who had the courage and fortitude to oppose Wall Street and their friends in attempting to block the use of American taxpayer funds to bailout the international bankers and investors who have reaped enormous profits at the expense of the Mexican people and now the American people. Representatives Marcy Kaptur, Duncan Hunter and Senator Alfonse d'Amato have been the leaders in Congress against the Wall Street Bailout. The reader encounters information that has been deliberately kept from the American people concerning the true nature of the \$50 billion bailout of the elite financial powers that dominate the governments of the Western world.

It is interesting to note that the Federal Reserve raised interest rates six times in America prior to the peso crisis. This helped push the peso over the brink. Remember a crash is the time to buy, but only for major global investors like J. P. Morgan, Chase Manhattan, Goldman Sachs, etc. They have now broken up control of Mexico by the elite oligarchy who has ruled Mexico for decades. The austere policies being put in place by Mexico's new president, allow foreign investors to buy up nearly everything except the oil monopoly in Mexico. The super elite in New York, London, Paris, Frankfurt and Tokyo are now buying major stocks and bonds in Mexico for a fraction of their original value. This tactic has been used over and over again throughout the world. A financial crisis always increases the wealth of the elite financial powers that preside over the fate of nations.

As a result of the crisis, Mexico's key businesses will now be owned to a major extent by the same foreign investors who pulled their funds out at just the right time and who are now moving quietly back into Mexico to pick up terrific stock bargains.

The Role of the United States in Solving Mexico's Monetary Crisis

Ms. Kaptur: "Mr. Speaker, I ask, please do not tell us this will be good to the people of Mexico. That autocratic state will not be one whit more democratic when this is all over. Its citizenry will not have any greater standing in that legal system, nor will our businesses, who do business down there.

"All that will happen is that the vise around the necks of Mexico's people will continue to grow tighter. Mexican wages will decrease even more. Life that is already tough for the majority of Mexico's citizens will become even more unbearable. Inflation will be even tougher to manage than it is now.

"But get this, Mexico's super-rich families took their money out of that country before the peso meltdown. How convenient.

"Why are they not being held accountable? Why should United States taxpayers put their money on the line when Mexico's 3 dozen ruling families have their billions safely tucked away offshore?...

"So, what is so new about this Congress? The idea is to hide the truth from the American people once again. Hold as few hearings as possible, limit floor debate, don't let the public know any of the grimy details. So let me ask again, what is so new about this so-called new Congress, anyway?

"And let me say to the real gamblers in all of this – you know who you are: The megabanks, the multinational corporations, and the speculators who pushed through NAFTA, there are a few of us who understand. You put our taxpayers now at the helm for your mistakes and for your greed. We are angry. We resent what you have done.

"My own feeling is that when you gamble, you should eat your own losses and not come whining to the American people to foot the bill. You are all big boys. You love this kind of free enterprise gamble. So practice some of it. Don't come running home to Mama in the Government.

"Let me just say even gamblers have rules. If you go to Las Vegas and consistently lose money, the casinos won't let you play at their tables anymore. It is a good rule. Mexico has consistently lost money and never paid back the principal on its loans from us. Why should we let them play again?...

"A week ago, the administration first said it needed \$6 billion. Then it raised it to \$9 billion, then to \$18 billion, then to \$25 billion. Then by the end of the week, it became \$40 billion, and that is on top of the \$18 billion line of credit already in place. How's that for 1 week's work?... (*Congressional Record*, January 17, 1995, p. H288-H289.)

New Billionaires in Mexico

Mrs. Kaptur: "What is really very interesting that our people should know about, when we say the smart money left Mexico before the peso devaluation, we are talking basically about the 30 or so ruling families and their friends. So they take the money out of Mexico which helps to contribute to the problem of that banking system in that nation, and if you look back in 1991, there were two billionaires, and that is with a 'b' in Mexico. Today there are 24 billionaires in Mexico as best as we can calculate after NAFTA locked in, which means some people have been getting very, very, very rich, and the majority have actually had a downward pressure on their wages and their life style has been made much more difficult.

"And I think what is interesting, if you look, and the gentleman may want to go into this, if you look at what Mexico has been importing from the United States over the last year, what really surprised me, when you went over those figures, the other day that the third highest import from us was art.

"Now, I am a member of the Toledo Museum of Art. I think I can draw pretty well myself. I love artists. I love music. I am not speaking against artists here. It surprised me in a nation where the average family earns under \$1,500 a year that art would be the No. 1, in the top three.... (*Congressional Record*, January 17, 1995, p. H291.)

Prime Minister of Canada Joins Board of NAFTA Proponent

Ms. Kaptur: "I would just say – and this will probably get me in trouble – but one of the big advertisers on this past Sunday morning, I ask the American people to check me out if this is not true, there is a company in Illinois called Archer-Daniels-Midland Co.....

"This particular show was one of the major news shows, and I sat there and I listened, and I thought, 'No wonder we cannot get our story...out on why NAFTA had flaws, and who is going to actually end up holding the bag on this peso bailout of Mexico.'

"Archer-Daniels-Midland was one of the biggest promoters of NAFTA, without the side agreements that we wanted in there. They are a sponsor of the show. Why would a sponsor want anyone to say anything that did not agree with their own private interests? This is all a matter of news record.

"Right after NAFTA was passed, the Prime Minister of Canada, who was one of the biggest proponents of NAFTA, Mr. Mulroney, was appointed to the board of ADM. This is amazing. It would be like the President of our country being appointed to a major corporate board that was supporting this kind of an agreement, and to get a seat on that board you are paid between \$37,000 and \$100,000 a year. I was really – I thought, in terms of the ethics that I agree with, there should be a cooling-off period. The chair was still warm. The ink on the agreement was not even dry, and I just used that as an example because that happens to be a very powerful corporation in our country with very definite interests, including that you hear the news in a certain way. I really – I never realized how significant it was, but it absolutely does color public opinion...." (*Congressional Record*, January 17, 1995, p. H293.)

Ruling Families in Mexico Move Their Money Out of Mexico

Ms. Kaptur: "Well, you know it is very interesting, and I think those in the know in Mexico were very aware of what was going to happen, and that is why they took their money out of the country, because the elections in Mexico were in

August. So they did not want any problems in the market before August, so they propped up the peso through August. Then we were considering GATT, the General Agreement on Tariffs and Trade, here, and they did not want any trouble in America. So we delayed that vote until we got back after elections in December, so they kept delaying it, and delaying it, and delaying it.

"Then Mr. Salinas left office. The new President was sworn in. GATT was finished, and that is when they devalued the peso. But by then their friends knew, the 30 ruling families down there, they had already taken their money out of the country. They bought art to insulate themselves against any currency fluctuations...." (*Congressional Record*, January 17, 1995, p. H294.)

Opponents of NAFTA Foresaw Fall of the Peso

Mr. DeFazio: "Well, it is strange. It is strange that we stood on this floor 14 months ago, backed by credible economists who said, 'Today, as you vote on the NAFTA agreement the Mexican peso is overvalued by 20 to 25 percent to make them look more attractive as a partner for the United States, to make them look as though their currency is stable. But it's inevitable after the passage of NAFTA they will have to devalue the peso by 20 to 25 percent.'

"And now we are told by the Secretary of the Treasury [Rubin], a former partner in one of the major investment firms in this country, that no one could have anticipated this. Well, the economists we talked to, who gave us a very critical analysis of NAFTA, could certainly anticipate it, did, and we are right on the money. In fact, they were a little bit overly optimistic about Mexico because we are talking the free market says the Mexican peso should actually go down 40 to 50 percent, and whatever happened to free-market forces? Where is the free market when we need it? If the market says the Mexican peso should be worth half as much, should the United States Government intervene to artificially prop it up?...." (*Congressional Record*, January 17, 1995, p. H294.)

U.S. Taxpayers Are Bailing Out Megabanks and Multinational Corporations

Ms. Kaptur: "Will the gentleman yield on that point because last week I sent the Secretary of the Treasury [Rubin] a letter signed by several of our colleagues, including yourselves, and one of the questions we asked him is: 'Because you are artificially propping up the peso because Mexico owes money, to whom does Mexico owe money specifically?' In other words, it can't make \$26 billion worth of debt payments, \$10 billion in the first quarter. Those sound like big numbers. We want to know which banks, which corporations, if it is part of the Eurodollar market, to whom is this money owed? If it is investment banks, speculators in the market, which ones are they? This is not just owed in general. This is owed in specific, and there are huge banking profits this year and last year. They have been doing real, real well. Why do they not have the capacity to eat their own losses? What about these big investment banking houses? The speculators? And I

appreciate risk-takers. But that is what risk is Risk is taking the loss if it does not go your way, and you take the gain if it does go your way.

"So which investment houses? I want to know specifically, before we vote here on this floor, who is this \$26 billion owed to? And there is another \$89 billion that Mexico owes payments on for their full public debt. To whom is that owed? You are talking about \$40 billion, Congressman Klink. There is the first \$18 billion from the currency swap and the line of credit last week. Then there is this \$40 billion. Then there is the \$89 billion that they still owe. Now, to whom is that owed? And why should our taxpayers be propping up those corporations, those megabanks, those multinationals that moved jobs out of this country. I mean, what is the sense of it? If they are making profits and if they have cash, why don't they pay it off themselves? That is what you do, you write off losses...." (*Congressional Record*, January 17, 1995, p. H294.)

Wall Street Protects Itself Before NAFTA is Set Up

Ms. Kaptur: "Let me now tell you more about the biggest budget buster that this Congress is going to be asked to vote on next week, with no hearings in the committees of this Congress, which essentially means you as a people cannot know. And it is going to hit our taxpayers very, very hard, in the wallet, with the jobs that they will lose to a much cheaper wage environment. You are going to pay in higher interest rates; you are already paying in higher interest rates because the market has discounted those losses. And you are going to pay in continuing obligations in increasing long-term debt that you will have to pay, because in effect what they are asking is for our people to become Mexico's insurance company, for the North American Free-Trade Agreement, NAFTA, sure is not free. We have lost a company a day to that nation since the agreement went into effect.

"Most Americans did not realize that, when NAFTA passed, at its heart was an investment guarantee to the Wall Street speculators, the multinational corporations, and the megabanks that in fact you are taxpayers now have to back up.

"If the gamblers went belly up in Mexico, the United States essentially had pledged your full faith and credit, and now the bills are coming due. Fifty-eight billion dollars for beginners.

"In fact U.S. taxpayers are now going to pay dearly and not just in more lost jobs. That is bad enough. But without a vote of Congress, last week our U.S. Treasury and Federal Reserve opened our lines of credit to Mexico to the tune of \$18 billion, your tax dollars, your deposits in the institutions of this country already sent to prop up the paper investments that the gamblers on Wall Street love to play with. And as far as the Government of Mexico is concerned, what this really amounts to is a new back door multibillion-dollar version of foreign aid, but they do not want to call it that, they do not really want you to see it as that, so they are using all kinds of fancy names, figuring most people have not gone to business

school, most people do not have a degree in finance. So the \$18 billion they extended they did not call what it really is, they called it a line of credit, they called it a swap.

"Now they are coming up here next week with a bill they are going to call a guarantee, and backing up the guarantee will be fees. There will be a commitment fee, a basic fee, a supplemental fee. There are so many different fees, but essentially all it is putting debt on top of more debt on top of more debt on top of more debt with higher interest rates, and more debt with higher interest rates that you back up with your tax dollars.

"No matter what you call it, you essentially are Mexico's insurance company. But ask yourself what is the collateral? What are your chances of getting your money back?

"Last week the Clinton administration and the Federal Reserve started bailing out Mexico with that \$18 billion of our currency through the U.S. Treasury, our Federal Reserve. It took no vote of Congress to do that. They do not have to come here for 6 months under the current law. Now the administration is asking us to guarantee this additional \$40 billion loans and there will be hearings here in the Congress. Believe me, it is a bottomless pit.

"The troubling fact about these speculators from Wall Street is they are the very same people who gave us junk bonds back in the 1980's, the very same people who put all of these leveraged buy outs together, who threw white collar workers, blue collar workers, pink collar workers out of work across America because these very same people were so greedy that they cashed out corporations, they bought companies, they dried up their pension funds, they diversified those holdings, they essentially bled out the wealth of this country, they put it in different nations around the world where there is no cheap labor and no democracy. And notice now they are sending those goods back here, and now they are trying to do the same thing as a result of this Mexican deal.

"The troubling fact about being this kind of a banker, and I even hate to call it a banker, it is really a speculator from Wall Street, is that they can create money; I wish each of us could, even when there is no collateral to back it up. They have got powerful friends. Let me tell you, my friends, they have powerful friends in the Clinton administration, and they have very powerful friends inside this institution. They like to talk about free enterprise, and being beholden to the rules of the private sector.

"But basically they are now coming and running to the Government because they are about to lose a big chunk of money. So when they have gotten in trouble, they have not followed the rules of the marketplace which is when you take a risk to that extent and you lose, you are big enough to eat the losses yourself and not come running to the taxpayers of our country.

"The Clinton administration is doing this along with the top leadership of this institution and taking this unprecedented action and doing it very quickly so that you do not really understand it, so you cannot complain and really have input through your elected Representatives here because the value of Mexico's currency has fallen by so much.

"Basically Mexico cannot pay its bills. It never has, and with the peso meltdown, keep this in mind, if you think about what is the collateral, its workers' wages have also been cut by 40 percent; the value of its people's savings accounts have been cut by 40 percent. Do you think they will be able to pay back what they owe us on top of all of the old debt that they still owe us? (*Congressional Record*, January 19, 1995, pp. H384-H385.)

List of Mexican Creditors Requested

Ms. Kaptur: "This is why we asked the Secretary of Treasury [Rubin] which specific interests, which banks, which investment houses, which corporate interests are Mexico's creditors at this point. We would like to see who owns those firms. We would like to see who the depositors are, we like to understand who we are giving our money to, because it is likely, based on past history, that Mexico will default again and the taxpayers of the United States, the new insurance company to Mexico, will help to bail them out. We just would like to know who we are bailing out. Do you not think that the American people have the right to know?... (*Congressional Record*, January 19, 1995, p. H387.)

Clinton Administration Negotiates Secret \$6 Billion Line of Credit

Ms. Kaptur: "Mr. Speaker, the administration claims it knew nothing of the pending financial disaster in Mexico. Mexico's administration claims it knew nothing.

"Let me remind both administrations of what they certainly did know. Both the Mexican and the United States Governments knew the truth about the shaky peso and United States speculators' interests down south for at least 2 years before the meltdown. As reported by the Wall Street Journal during the NAFTA debate, the two governments went so far as to negotiate a secret line of credit worth \$6 billion because of the pending financial crisis in Mexico. Both governments knew; both governments kept it quiet.

"No Congress is expected to remain muzzled with truncated committee hearings and limited debate.

"Congress cannot remain silent. Let the truth come out before we vote no on this taxpayer bailout of Wall Street speculators in foreign countries." (*Congressional Record*, January 25, 1995, p. H657.)

Opponents of NAFTA Were Aware of Mexico's Shaky Financial Situation

Ms. Kaptur: "Mr. Speaker, my friends, please consider this carefully: The Administration's and congressional leadership's proposed \$40 billion in loan guarantees plus \$18 billion in swaps and lines of credit to Mexico and Mexico's creditors is unprecedented. Never has the U.S. pledged the full faith and credit of our Government to a foreign Nation's creditors on such a huge scale. This proposal would risk U.S. taxpayer money to support a foreign government with an authoritarian past. Before we jump headlong into a new role – as insurance company to Mexico – let us stop for a minute and consider carefully what's happening here in Washington.

"Only one hearing was hastily scheduled yesterday to leave the impression this House is actually deliberating on this matter. But in fact no bill has been introduced by those working behind closed doors to cobble this together. To get answers to some of our questions, a group of colleagues from the Fair Trade Caucus and I held our own forum yesterday afternoon. Many distinguished economists and experts, representatives of outside groups, and Members from a diverse cross-section of the political spectrum had the opportunity to express their views in opposition to this rescue package.

"Then this morning, the Washington Post had an article saying that a new Los Angeles Times pool shows that 81 percent of 1,353 adults surveyed oppose the Mexican bailout. And another California poll showed that 97 percent are opposed. Shouldn't we listen to the 80-90 percent of our constituents who want us to vote against this when it is there \$40 billion on the line if Mexico defaults.

"The financial meltdown of Mexico was being discussed well over a year ago during the NAFTA debate. One has only to turn to the public record to learn the truth. Not only did our colleagues, like Representatives LaFalce and Gonzales, repeatedly bring up the potential liability posed by Mexico's economic policies and the speculative practices of United States investors – but economists, journalists and others did so as well. Let me quote you just one example from a June 1993 report by Jeff Faux of the Economic Policy Institute: 'NAFTA...is a formula for creating future demands that the U.S. taxpayer bail out the Mexican banking system in order to save the assets of major United States financial institutions.'

"If the administration and leadership of this institution persists in its cries of ignorance, one has only to cite the secret \$6 billion dollar line of credit that the administration and the Mexican Government negotiated in the days leading up to the NAFTA vote. It was recognized then, over a year ago, that the Mexican economy was in trouble. It should have further been recognized that the United States was in grave danger of being liable for the fallout. Instead, the administration kept the \$6 billion quiet.

"So it is folly to say that the administration and the Mexican Government did not know of the coming storm. In a recent New York Times article, it was quoted, 'According to officials in Washington, the Treasury Department told several Mexican officials starting last summer that the country's short-term borrowings had reached a dangerously high level and that the peso was being kept artificially high.' They knew. They did not want us to know.

"Earlier this month, Representatives Hunter, Defasio, Everett and I sent a letter of inquiry to Treasury Secretary Rubin listing our questions regarding Mexico's financial crisis, and I have a copy of that letter here with me today. We have received no reply to the specific questions we raised in our letter. And so I ask the Treasury Department again: to whom does Mexico owe its existing debt? What collateral that has not already been pledged to other creditors in Mexico willing to put up? What type of economic and political reforms is Mexico willing to pursue? These and other questions need to be answered before any legislation is called up for a vote. If American taxpayers are asked to bet \$40 billion dollars, they deserve at least that consideration.

"We are waiting for answers to those questions because frankly the reasoning that has been offered as to why this bailout package is in the best interests of the United States and the vast majority of Mexicans has been grossly inadequate. For example, it is now being said by the administration, and I quote from the Treasury Department's briefing paper, '(T)he goal of our support package is to protect our economic interests in a nation which has become our third largest export market. Mexico bought more than \$40 billion worth of our products in 1993, and nearly 770,000 United States jobs depend directly on exports to Mexico.' Pardon me, but who does the administration think they are dealing with? A fifth grader can see imports from Mexico going up and exports to Mexico going down, and can tell you that we are headed for a trade deficit with Mexico. A smart eighth grader could tell you when the value of their money has been cut in half, they won't be able to buy as much from us and we are going to be running a trade deficit with Mexico in a few months. Add this unfortunate circumstance to the fact that the United States in 1994 suffered its worst trade deficit in history with 20,000 U.S. jobs lost for every billion dollars of deficit. We are talking about the hollowing out of another 3.1 million jobs.

"The United States is not going to increase its exports. In fact, the Mexican Government devalued the peso to do exactly the opposite: to decrease United States exports to Mexico and increase Mexican imports to the United States – so that Mexico will have the money to pay its debts to Wall Street, megabanks, investment houses, and multinational corporations.

"Members of Congress must demand answers. Who exactly owns the Tesobonos and how much interest are they being paid? It is not good enough for the administration to say that United States investors lost 40 percent of their

Mexican investments in the last month, without also admitting that those same investors have been earning up to 66 percent returns on those same investments. Since 1990, in emerging market mutual funds, certain folks have made handsome profits. As they reaped their huge dividends, let them now eat their losses.

"It is not good enough to say that the \$40 billion in new loans will be secured by Mexico's oil reserves. At current oil production and price levels, the gross export receipts for Pemex, Mexico's national oil company, are only about \$8.5 billion a year. Many economic experts, including Walker Todd, a former Assistant General Counsel for the Federal Reserve, say that virtually all of Mexico's oil has already been pledged to other creditors – notably holders of Eurobonds. Perhaps most importantly, Mexico's energy minister, Ignacio Pichardo Pagaza, in a January 23, 1995 article in the Financial Times stated Mexico has no intention of putting up its oil reserves as backing for these loans. He stated: 'Our oil will not be mortgaged, nor will it form part of any loan guarantees.' So don't count on promises of Mexican oil to help our taxpayers swallow this bitter pill. Even if Mexico did promise and then reneged on its promises, where would the United States seek legal redress in a court of law? The guarantee can't be enforced. No U.S. court has jurisdiction. No Mexican court has jurisdiction.

"As Barron's magazine said last week, on this one the United States got caught in the 'Venus fly trap' of the hemisphere. Mexico's clever leaders postponed the hardship until after NAFTA passed. If this passes, the United States will be held hostage to every debt on the continent.

"Finally, I would recommend to all Members that unless you get full answers to hard questions, and I doubt you will, you should vote no on this bailout.

Congress of the United States, House of Representatives

Washington, DC, January 11, 1995.

Mr. Robert Rubin,

Secretary of the Department of the Treasury,

Washington, D.C.

Dear Secretary Rubin: We are writing in regard to the Administration's decision to extend a \$9 billion dollar line of credit through the U.S. Treasury and the U.S. Federal Reserve to the government of Mexico in order to stabilize the Mexican peso. The U.S. Federal Reserve has further committed an undisclosed amount of U.S. dollars to the same end. Using uncollateralized loans, major U.S. commercial banks have loaned another \$3 billion. The total sum of the peso bailout represents a huge commitment by the U.S., our taxpayers and our banking system. We are sure that you will agree that American people have a right to know what

risk they are assuming in these transactions. With this in mind, please find below a series of specific questions to which we would appreciate answers as expeditiously as possible.

"1. In view of the fact that U.S. banks are earning historic profits, why is U.S. government intervention – in the form of a currency swap and lines of credit – necessary? When the private sector gambles and loses, shouldn't those losses be borne by the private sector?

"2. To what specific banking and corporate interests does Mexico owe the \$26 billion in outstanding obligations that come due this year, \$10 billion of which is due in the first quarter, and \$16 billion of which is allegedly owed to U.S. interests? How much in additional obligations comes due in 1996 and 1997; specifically, to whom is it owed?

"3. Of those business entities incorporated in the U.S. to which Mexico is indebted, which hold voting rights at their regional federal reserve banks, and in which regions?

"4. Under what conditions is Mexico permitted to draw on the \$9 billion U.S. currency swap line and \$5 billion line of credit from the Bank for International Settlements, of which the U.S. Federal Reserve is a member?

"5. What will be Mexico's 'assured source of repayment' if it draws on these funds?

"6. What are the explicit terms of this credit facility – for what period of time, and under what conditions is the facility renewable?

"7. If Mexico defaults, is it the intention of the U.S. Treasury to enlarge the assistance? For what period of time, and for what purpose?

"8. Under what legal authority was the original swap line negotiated and more recently increased from \$6 billion to \$9 billion?

"9. Why is the commercial bank line of credit in the peso bailout uncollateralized?

"10. What financial instruments have been or are being created to carry out Treasury's currency swap and any related transactions?

"11. How are these instruments different from Brandy bonds, formerly sold to bail Latin America out of its debt crisis? Brandy bonds were collateralized by U.S. Treasury securities.

"12. What is the current yield of Brandy bonds?

"13. What percentage of the interest Mexico must pay its bondholders in 1995 represents interest due Brandy bondholders?

"14. In the NAFTA agreement, U.S. banks won access to the Mexican financial system, with limits, initially at 8%, rising to 15% by 1999. In view of the peso devaluation, what risks are posed to the U.S. of complete foreign ownership of the Mexican banking system; by the U.S. or other nations?

"Thank you for your cooperation. We look forward to hearing from you soon.

Sincerely,

Marcy Kaptur.

Peter DeFazio.

Duncan Hunter.

Terry Everett.

(Congressional Record, January 26, 1995, pp. H783-H784.)

Bailout Will Not Save NAFTA

Mr. Stupak: "Mr. Speaker, I am here tonight to express my concerns about the proposed Mexican bailout.

"Proponents of NAFTA suggested that its passage would create jobs in America, promote free-market economics in Mexico, raise living standards in both countries, and encourage Mexico's move toward democracy. Those who thought that NAFTA would be a magical elixir were wrong. NAFTA exists today. Necessary changes can only happen one way – through the Mexican Government. But Salinas did not do it, and President Zedillo has given no indication that he will be any different from Salinas.

"First, this bailout will not save NAFTA. Mexico's problems run far deeper than short-term debt.

"Second, this bailout will not help restore international confidence in the Mexican economy.

"Third, this bailout will not help Mexico's or our working and middle class.

"The direct beneficiaries of this package will be members of the Mexican business and political elite seeking to protect their wealth against further devaluation of the peso. *(Congressional Record, January 25, 1995, p. H660.)*

Mexico Has a Statist Economy – Not a Free Market Economy

Mr. Barr: "Mr. Speaker, why are the American people being asked to bail out the Mexican economy to the tune of \$40 billion?"

"Despite listening for 2 hours to administration officials this morning at the Banking Committee hearing, I still fail to understand why we should be expected to put the full faith and credit of the United States on the line for a country that has a long and painful past of undisciplined financial mismanagement.

"I cannot support some hastily slapped-together financial deal, especially in the absence of the President providing a coherent policy. The President has an obligation to formulate a viable program that will guarantee Mexico's inflationary policies won't put Main Street America another \$40 billion in the hole. Last night all he said was – we need to bail out Mexico. On top of all his rhetoric last night, the President spoke to the importance of the Nation pulling together and making sacrifices for the greater good. I think it is unconscionable to ask 262 million Americans to bail out Mexico's ruling elite.

"Many Latin American countries, and not just Mexico, have dismal track records when it comes to paying back loans, whether they are from private, international or governmental sources. It is no secret that Mexico has a statist economy, that has tenaciously clung to that legacy since independence. The bottom line is that statist economies do not work. They are financially unstable and unreliable.

"This bailout idea looks more and more to me like the first of what may be many more payments on a bad NAFTA deal. (*Congressional Record*, January 26, 1995, p. E186.)

Abuse of Power by the Federal Reserve Board and the Treasury Department

Ms. Kaptur: "Today the administration, with the acquiescence of the top leaders in this Congress, announced a sweeping \$47.5 billion bailout of the Government of Mexico and its Wall Street creditors by our taxpayers through the instrumentalities of the United States, including our U.S. Treasury, our Federal Reserve, the International Monetary Fund, into which the United States pumps money, and the Bank for International Settlements, on whose board sit the chairman of our Federal Reserve and the chairman of the New York Federal Reserve.

"All of this was done without a vote of the Congress of the United States, the only federally elected officials representing the people of this country.

"This newest proposal is a perpetuation of the worst kind of manipulative politics, both here in our country and in Mexico. And from a constitutional

standpoint, it is absolutely precedent setting in the abuse of power by our own Federal Reserve, in collaboration with the U.S. Department of Treasury.

"This new proposal is nothing short of a circumvention of the democratic process and a circumvention of the proper role of the elected leaders of the Congress of the United States.

"The administration chose this path because they knew that they did not have the votes in this Congress, nor the support of the American public. In fact, over 80 percent of the American people oppose this bailout.

"This new proposal is representative of what is wrong with politics in our country: not reflecting the will of the people.

"Federal Reserve Chairman Greenspan, officials in the administration, and the top Republican leadership of this Congress have all exhibited this type of behavior during the present Mexican peso crisis and further through past trade policies which created this mess, an arrogance and abuse of power which knows no bounds.

"It is well known that people tend to change once they come into the beltway in Washington.

"In October 1979, Federal Reserve Chairman Greenspan told the Senate Banking Committee that a proposed \$750 million loan, one-fortieth of what is being proposed here, for near-bankrupt Chrysler Corp. was a bad idea that flew in the face of the principles of free enterprise. This is the same man who by raising interest rates has increased your mortgage payments and increased your monthly credit card payments, eating into your wages over the last 20 years.

"Chairman Greenspan and the Federal Reserve are trying desperately to cover their own tracks in this crisis. In fact, it was the Federal Reserve's own interest-rate policies of the past 3 years that helped set Mexico up for a fall.

"Low United States rates in 1992 and 1993 led speculators to pump record levels of money into Mexico, some estimating over \$70 billion, and other emerging markets, but then the Fed's interest rate increases of 1994, all six of them, led those same investors to pull their money back out and bring it home.

"If Chairman Greenspan was so concerned about Mexico, he would certainly not have raised United States interest rates six times over the last year.

"The latest increase in interest rates means that if you own a \$60,000 home with a 30-year mortgage, your mortgage payments have gone up by an additional \$100 a month. And as a result of the Fed's actions, your home will cost you about \$1,200 more a year or about \$36,000 over the life of your mortgage.

"Chairman Greenspan is unelected, unaccountable, and evidently unaware of the people's lives in this country that his policies affect.

"There is absolutely no reason that a proposal of this magnitude should not be considered by the Congress of the United States.

"Under the Constitution, we have the absolute authority to coin money and to regulate the flow of money between nations. What was done here, very cleverly through the back door, was that an entity within the U.S. Treasury Department, the Currency Stabilization Fund, took deutschemarks and yen that they hold and they said to the Federal Reserve, we will borrow against those. And essentially a flow of funds came from the Federal Reserve to the U.S. Treasury against the terms of the Constitution of the United States, which require all appropriated dollars to be voted on by the Congress of the United States...." (*Congressional Record*, January 31, 1995, p. H958.)

Wall Street Demands That the Federal Reserve Raise Interest Rates

Mr. DeFazio: "Furthermore, Alan Greenspan, the Chairman of the Federal Reserve, appointed by the last Republican President, has said that we overstate inflation in this country. He testified just last week before the Banking Committee and said, 'Well, you know, the CPI overstates inflation by 1 to 1 1/2 percent.' That means, according to Alan Greenspan's own numbers, inflation is at more than a 30-year low in this country. Yet they are going to go back to the well one more time. They are going to raise interest rates again. They are going to raise the price of houses again, refrigerators, anything you buy on time will be increased.

"Why? Not because there is a real threat of inflation, but because it is being demanded by Wall Street.

"Now, it is an interesting question who makes monetary policy in this country, who controls the currency of the United States. And are we running this nation for a few select bankers on Wall Street, or are we running this Nation for the American taxpayers? That brings up the Mexico bailout...." (*Congressional Record*, January 31, 1995, p. H962.)

Banks Raise Interest Rates to Increase Profits

Ms. Kaptur: "And you ask yourself why would interest rates be going up in the United States. Well, they are not really going up because of what is happening in this country, but the markets are reflecting draws on the system because of decisions made by money-center banks and large corporations in other countries.

"The closest one at the moment is Mexico. I believe interest rates are going up in this country because the market is taking it out on the American people, the banks that have a lot at risk and have made some bad decisions, and the brokerages

that borrow from them have made some bad decisions. And now the American people are having to pay for it in their checking accounts, in the mortgage payments that they make, as the gentleman said, and what you mentioned in terms of the price of a \$100,000 house.

"I know I figured it out for a \$60,000 house in Toledo, OH. The interest rates over last year will cost that family \$100 more a month, \$1,200 more a year.

"I do not care how much tax-cutting we do this year in this Congress, we are not going to be able to offset the real dollars people are paying every day through the worst taxes of all, which are these higher interest rates people pay on their credit cards and cars and on their homes.

"Some of the people that are causing the trouble were talked about today beginning on page A3 of the Wall Street Journal in an article called 'Mexico's Currency Plunges Nearly 10 Percent,' and it continues on page A8. We have been asking the Clinton administration for a list of who Mexico owes money to, who are the creditors that are supposed to be bailed out. Of course, they have not sent us an answer.

"It is very interesting what it says in the top paragraph on page A8. It says that if the Congress and the taxpayers were to bail out Mexico, one beneficiary would be the firm that Treasury Secretary Robert Rubin used to run, Goldman, Sachs & Co., which ranked as the No. 1 underwriter of Mexican stocks and bonds in the United States and European markets for 1992 through 1994. In those 3 years, according to Security Data Co., Goldman underwrote over \$5 billion worth in Mexican securities compared with \$2 billion for the securities unit of J. P. Morgan & Co. Third was Bear, Stearns & Co. at \$1.8 billion...." (*Congressional Records*, January 31, 1995, p. H963.)

The Bank for International Settlements Works closely with Federal Reserve Board

Ms. Kaptur: "And the gentleman asked about the Banking Committee. In my 8 years that I spent on the committee, Mr. Speaker, I never saw the Currency Stabilization Fund used for this purpose. It was always used in small amounts, never to the tune of \$20 billion. We are trying to research back to see the largest such use of the fund. Maybe we found \$2 billion back 10 years ago, but never to this extent, and never to defend the debts owned by another country. This is a very precedent-setting move that is occurring here.

"In addition to that, there is an additional, around \$17.5 billion, coming through the International Monetary Fund, and at the moment it is unclear to us whether that is \$17.5 billion in new money because the U.S. contribution to the IMF has to be appropriated dollars through here. Are those old dollars? Are those new dollars? Where are those dollars coming from?

"And then the third element of this is the International Bank for Settlements, which is \$10 billion, and it is very interesting because the Bank for International Settlements has a board just like the Federal Reserve. It has 24 members on the board. The United States has never participated on that board before. We were not making payments. All of a sudden who ends upon the board of the 24 most recently? The Chairman of our Federal Reserve, Alan Greenspan, and the chairman of the New York Fed, Bill McDonough, all of a sudden. And Citibank, surprise, surprise, is all of a sudden making payments into the Bank for International Settlements...." (*Congressional Record*, January 31, 1995, p. H965.)

Former President of Mexico Joins Board of Dow Jones and Company

Ms. Kaptur: "But I think it is important for the record to indicate that the former president of Mexico, the most recent president of Mexico, Carlos Salinas, was appointed to the board of Dow Jones & Co., which owns the Wall Street Journal, and it does not surprise me, therefore, as I read the various headlines in the Wall Street Journal and some of the hype that has been put into trying to make it seem like if we do not do this there will be an apocalypse, 'Mexico worries spread to emerging markets,' the headlines, 'Mexico's currency plunges 10 percent amid worries about U.S. rescue plan.' The headlines, you worry. Headlines form policy. It is important to know who is in position to make opinions about this and influencing public opinion.

"So if I might further respond to the gentlewoman from Idaho, my hope is that as we get more details on the package, over the next day we hope – we were not able to get the fine print today – we will be able to answer your constituents and our own with more specificity as to the role of the Bank for International Settlements in this.

"We know it is \$10 billion. We do not know how that is being drawn down. We were not provided with any details today." (*Congressional Record*, January 31, 1995, p. H966.)

The Relationship of the Federal Reserve Bank in New York and the Bank for International Settlements

Mr. DeFazio: "I think the gentlewoman for answering questions as best we can at this time.

"I think the gentlewoman from Idaho has raised an excellent question. The Bank for International Settlements, what is the United States' obligation to that bank at this point in time? How is it we came so recently to be represented on the board of directors by Alan Greenspan and the chairman of the New York Fed?

"What commitments has the United States made of either funds that are being channeled through the Federal Reserve Board in secret, or more overt agreements or obligations of the Federal treasury? How much do we have at risk here?"

"I think these are excellent questions that need to be answered.

"You know, there is this wisdom that somehow we have to allow the Federal Reserve to operate in secret because it is the only way to give them political independence. The Bundesbank in Germany is I think the most highly regarded central bank in the world, and they are required to conduct all their deliberations, negotiations, discussions and votes in public. But yet our Federal Reserve somehow is the only agency of the Federal Government, more powerful than the Congress and the President combined in terms of the economic future of this country today, in terms of whether or not we bail out Mexico or raise interest rates again to fight inflation that no one else sees except for Alan Greenspan and a few other inflation warriors at the Federal Reserve, they do all this in secrecy. They change the policies to say they think 4 percent unemployment is too low and they would rather have 6 percent, because otherwise wages might go up a little bit and working people might earn more in this country and that might start an inflationary trend. At the same time they are tying us to international agreements and institutions which are diminishing the role of U.S. labor.

"So on the face of it their arguments are not even consistent. But they do not have to account to anyone. They do not have to answer questions if we call down there.

"My staff called down today to ask about conflicts of interest by members of the Federal Reserve Board. Do any members of the Federal Reserve Board represent regional banks which are heavily invested in Mexico, and have they disclosed that fact, have they refused themselves from voting as they apportion funds to bail out Mexico? No, we are not allowed to know the answer to that question.

"So what is this body we have created, that is so much beyond the public and the elected representatives of the people? Its role in this bailout is just extraordinary...." (*Congressional Record*, January 31, 1995, p. H966.)

Why Should Main Street Bail Out Wall Street?

Mr. Funderburk: "Mr. Speaker, this morning the Secretary of State and the Secretary of the Treasury canceled scheduled appearances before the International Relations Committee. This administration has a serious credibility problem. It has ignored the American people and done a deliberate end-run around the Congress. I do not care what obscure law the President cites for his authority. There is outrage in my district, and I suspect throughout the State of North Carolina

"We have rescued the Mexican economy several times since 1976. Each time we have done so, the Mexican Government has refused to reform itself.

"Bailing out investors stuck with bad pesos is not the job of the taxpayer. Why should Main Street bail out Wall Street? What sort of message is sent when holders of high-yield securities are bailed out by the taxpayers?

"When Mr. Rubin was chairman of Goldman, Sachs, his firm did not socialize domestic profits it earned when it was speculating. The same system that rewarded his old firm should work to penalize his former colleagues who gambled and lost.

"I ask this administration to tell Main Street, Dunn, NC, it has to pay for Wall Street's mistakes and a corrupt regime in Mexico...." (*Congressional Record*, February 1, 1995, p. H976.)

Mismanagement by the Ruling Elite in an Undemocratic Country

Ms. Kaptur: "Mr. Speaker, the administration announced yesterday that, because Congress was not acting quickly enough to throw good money after bad down that black hole that is the Mexican economy, it has used unprecedented Executive authority to extend billions of our taxpayers' money to bail out the Mexican peso and the Wall Street speculators who invested there without a vote of Congress. The last time Mexico devalued its currency was in 1988, just around the time of the Presidential election. Before that, Mexico devalued in 1982, again just around the time of the Presidential election, and now they did it again just after the Presidential election of 1994.

"I say to my colleagues, 'Some would like you to think that using Treasury's power to prop up the peso was a temporary fix, but they are wrong. This is not a currency problem. It is a problem of continuing mismanagement at the highest levels inside an emerging undemocratic country. The false security of Mexican oil is an illusion, too. That's already been pledged to past debts....'" (*Congressional Record*, February 1, 1995, p. H977.)

Renowned Economic Expert Opposed Bailout

Mr. Hunter: "Let us talk a little bit about the peso bailout and some of the conservative Republicans who recently have testified in our forums.

"Bill Seidman is a conservative Republican renowned economic leader, former chairman of the FSLIC, a guy who knows bailouts, and he made a couple of good points in his speech to our forum when he said, 'Do not bail out Mexico.'

"First, he does believe in the free market and he could not understand why people who believe in a free market and who believed in NAFTA would now

believe that somehow the politics and the economics of subsidies to Mexico now make sense.

"He pointed out that Mexico has gone through in the last 10 or 20 years a number of devaluations, and they have not had these disastrous apocalyptic effects that all of the deep breathers tell us are going to happen now if we do not bail out Mexico with a \$40-billion-plus package. Here is Bill Seidman, a renowned conservative economic expert relied on by this Nation in very difficult times saying we do not have to do it, let the market adjust it. He made a great statement. He said this issue should be resolved between Mexico and her creditors, let us resolve this between creditor and debtor.

"Let us stay out of this as the United States of America. In listening to witness after witness on the Democrat side and the Republican side across the political spectrum coming up and testifying against the bailout, it occurred to me that this has revealed another aspect of national policy that should be looked at very closely.

"If this is free trade, this is the result of free trade where a tiny nation economically like Mexico, which has approximately the economy the size of New Jersey's, can be in a position to pull the United States down because it has a downturn. Have our policy-makers who have outlined a free-trade policy for the United States supposedly with a deep intellectual base really been right when the effect of their policy is to handcuff the United States to Third World nations in deep water that do not know how to swim? That is what we have done.

"If we have lost our independence and if we now are committed to bail out every nation which becomes inextricably linked with our economic well-being through our trade policies, is that smart?

"Regardless of whether or not you like the trend lines on the exports and the imports, is it right for us to give up our independence and link ourselves with these nations? Does that mean we are now going to link ourselves with Argentina, we are so linked that we now have to bail them out if they have a problem, or any of the other dozens and dozens of Third World nations which now will call on the United States to help bail them out because we have a substantial trade relationship?

"Now, let me just conclude by giving one 'I told you so' and 'Let's look at this thing in the future,' to all of my colleagues, my good friends, who supported NAFTA. The claim by the pro-NAFTA advocates on this floor was that Mexican workers were going to achieve a larger standard of living, go above that \$1,900 per capita per year income, and they were going to get up there to the point where they were making enough money to buy large amounts of American consumer goods and increase our exports. This devaluation has decreased the capability to buy by

about 30 percent. This proves that NAFTA was wrong." (*Congressional Record*, February 1, 1995, pp. H1030-H1031.)

Oil as Collateral for Loan Guarantees

Ms. Kaptur: "Mr. Speaker, I want to compliment the previous speaker, the gentleman from California [Mr. Hunter], who has been so much a part of our efforts to really open up international trade and explain the consequences to people in this country and abroad.

"I rise tonight with a rather heavy heart because of the action of the Clinton administration. Our Government is not a monarchy. We are a nation of laws and of balance of powers between this legislative branch, which is the first branch that the Constitution mentions, and the action, in my opinion, by the Clinton administration in extending over \$47 billion worth of credit from the taxpayers of this country is outside the constitutional boundaries of the executive branch.

"Now, Wall Street today and their irresponsible money men are cheering, because they essentially have been bailed out along with their 24 billionaire friends in Mexico with this gift package from the taxpayers of the United States of America with no vote by Members of this Congress. Wall Street investors have every reason to be happy. They got their money back from you, the taxpayers, but the American people should know that they are at risk, because this deal is backed up by worthless paper certificates of oil serving as collateral.

"Now, why do I say this? Does not oil have value? Under normal circumstances, it would. But the Mexican Government has long used its oil over and over, the same oil again, as collateral for debts they already owe.

"Did you know that Mexico has already pledged its oil in the European bond market, the Euro-bond market, for upwards of \$10 billion? That fact is Mexican oil no longer has any value for use as collateral on new debt, because it is pledged to old debt, and Mexico owes anywhere between, on the public debt it owes, between \$160 billion and \$200 billion.

"It would be almost better for Mexico to pledge jumping beans rather than to repledge their oil again.

"In the RECORD tonight I have taken out of Moody's Manual a list of where Mexico's monopoly-owned, state-owned oil company, Pemex, has already pledged the assets of their oil company.

"Suffice it to say, all the administration accomplished by conditioning new loans, these \$47 billion worth of loans from our taxpayers, on Mexican oil was to put our taxpayers at the end of a very long line of creditors to that oil. Even adding

up all the assets and production of Pemex, Mexico does not have enough oil revenue to cover the \$47.5 billion worth of new loans.

"In fact, the Houston Chronicle reports that Mexico will become a net oil importer by the turn of the century, because it is essentially producing half of the oil it produced a decade ago because of problems inside that oil company.

"Now, add to that what Mexico's own officials have said. The Mexican Secretary of the Treasury said, 'Our oil resources are not going to be used for guarantees.' Well, if they are not, what is backing up the risk to the taxpayers of this country?

"And Mexico's Energy Minister was quoted recently, and a direct quote again, 'Our oil will not be mortgaged nor will it form any part of any loan guarantee.'

"Now, maybe the United States Ambassador to Mexico cannot read Spanish, but it is all there in the Mexican newspapers to be read by anyone.

"Basically, my friends, by dodging Congress, our people have been sold a bill of goods that have no value by the administration in collaboration with the Government of Mexico. now our administration is scrambling to make this back-door deal look as legitimate as possible, but the fact remains the so-called collateral that Mexico is putting up for the \$47.5 billion in loans is worthless and, in fact, experts have estimated the entire worth of Pemex at somewhere perhaps, if we are lucky, about \$24 billion.

"So ask yourself when you read the fine print and they say they are going to book sales of oil on the Federal Reserve of New York's books, who is cooking the books? We are not getting barrels of oil. We are getting pledges of collateral that has already been overpledged.

"And if you really want to get cynical, and I will end with this statement, is it not interesting that this is not the first time this has happened? But in fact it happened right after the Presidential election of 1988, during that period when they were trying to prop up the value of the Mexican peso. It happened in 1982, and now they devalued the peso right after the Mexican election in 1994.

"Let the record speak for itself...." (*Congressional Record*, February 1, 1995, pp. H1030-H1031.)

The Rich and Powerful Benefit from Big Government

Mr. Duncan: "Mr. Speaker, I rise to once again voice my opposition to the Mexican bailout, and especially to the way in which it is being done.

"I have frequently said that today we have a Federal Government that is of, by, and for the bureaucrats, instead of one that is of, by, and for the people. But even I did not realize how little control the people of this nation now have over their own National Government.

"Once again we see the arrogance, the elitism, the public be damned, Big Brother knows best attitude of the powerful people who run this Government.

"Because of the overwhelming opposition of the American people to this Mexican bailout, the President did what has been described as an end run around Congress.

"Apparently, he found that the votes were not there, even though the political correct vote, the 'anything to gain the approval of the national media vote' would have been to be for this bailout.

"So the President and the big financial powers decided to come up with a plan that did not require congressional approval. This means that our Government is sending billions to Mexico even though everyone knows the vast majority of our people are opposed to it.

"This is the most undemocratic – with a small 'd' – thing I have seen during my slightly over 6 years in Congress. It flies in the face of the will of the American people.

"Big Government liberals have long had the belief or philosophy that Government knows best – that the people really don't know how to run their own lives or spend their own money.

"This latest action – sending this money to Mexico – is just another example of big government spending the people's money in a way that most Americans do not want. And boy are we talking money here – billions, with a 'b.'

"A few weeks ago, through the Treasury Department and the Federal Reserve, we provided \$9 billion of an \$18 billion package to prop up the peso. That wasn't enough.

"Now, the President has announced he is taking \$20 billion from the Exchange Stabilization Fund, even though this money was designed to stabilize our own currency and even though it has never before been used to prop up the money of a foreign country.

"Also, we are using \$20 billion of the \$25 billion in this fund, thus placing our own money in a less secure status.

"In addition, Mexico will receive \$17.8 billion from the International Monetary Fund, the largest loan in the Fund's 50-year history. Who is the largest contributor to the IMF? The U.S. taxpayer of course.

"Then we are sending \$10 billion more from the Bank for International Settlements.

"Billions and billions and billions – and all this at a time when the Heritage Foundation says Mexico already owes us over \$70 billion that they cannot now and probably never will repay.

"The big Wall Street and International investors bought Mexican bonds paying 24 and 30 percent interest rates. They certainly did not share their profits with U.S. taxpayers, but now they want us to protect them from losses for their foolish risks.

"Even a liberal like A.M. Rosenthal, the New York Times columnist, has come out strongly against this deal.

"Last Friday, he wrote:

"'Could it be that the administration had so enthusiastically promoted Mexico that it would have been terribly embarrassing – an election coming up and all – to disclose that Mexico 'suddenly' could not go on backing up its pesos and bonds unless the United States offered heavy loans to bail out investors?'

"And then he wrote, while we were still talking about just \$40 billion in loan guarantees – instead of the more lavish deal we now have:

"'Economic aid is often justified, but not 40 billion dollars to a country whose mess was created by the cowardice of bureaucrats and the mistakes of investors, theirs and ours. Americans would be foolish – I am being exquisitely polite today – if they agreed to any loan before they found out which American and Mexican investors would be the big beneficiaries....'

"Once again, Mr. Speaker, our Federal Government has shown that only the rich, the powerful, the wealthy, and those who work for the Government truly benefit from Big Government.

"In the meantime, our taxpayers get the shaft – they are left holding the bag – this time for a wasteful Government in Mexico, whose economy has been ruined by years of socialism.

"We probably cannot stop this now, but we would if we were truly listening to the citizens we are supposed to be representing...." (*Congressional Record*, February 2, 1995, pp. H1145-H1146.)

President Clinton Does an End Run Around the U.S. Constitution

Mr. Bunning: "Mr. Speaker, article I of the U.S. Constitution vests the power of the purse in the Congress. Unfortunately, the President of the United States has taken it upon himself to do an end run around the Constitution, the Congress, and the American people to bail out Mexico.

"Mr. Clinton has pushed the barriers past the breaking point. He is basing his power grab on a twisted reading of his authority under the Gold Reserve Act of 1934. That is the law which established the Exchange Stabilization Fund that Mr. Clinton has raided to save Mexico.

"The Exchange Stabilization Fund was not meant for the kind of shenanigans that Mr. Clinton is trying to pull. It was designed to ensure that we would have an orderly and stable system of exchange rates.

"In other words, the Gold Reserve Act gives the President authority to stabilize the U.S. dollar and protect its value. It does not give the President the authority to prop up the currency of Mexico.

"It seems that Mr. Clinton needs to take a refresher course in constitutional law. Only Congress has the authority to appropriate money.

"Apparently, the chairman of the Federal Reserve, Alan Greenspan, doesn't think too much of Mr. Clinton's bailout scheme either.

"The Washington Times reported on February 1 that the Exchange Stabilization Fund, the IMF and the BIS do not have the resources to deal with Mexico's problems. He went on to say that the bailout should be addressed by the political leaders of the country because of its broad implications.

"Mr. Greenspan is not alone in thinking that this financing scheme is a multibillion-dollar disaster waiting to happen....

"Our financial partners in Europe seem to understand the problem. When it came to a vote at the International Monetary Fund, Germany, Britain, Denmark, the Netherlands, Belgium, and Switzerland all abstained from voting rather than support Mr. Clinton's plan.

"I applaud my colleague, Mr. Taylor of Mississippi, for pushing the envelope of this issue by introducing a privileged resolution that will put the House on record as to where we stand on this bailout.

"His resolution will put us on track to determine whether the President has acted outside the scope of his authority.

"We have all sworn to defend the Constitution of the United States. If the President is wrongly seizing power from the legislative branch, it is our duty to stop him.

"Mr. Taylor's privileged resolution is just the thing to start the inquiry into what I believe may be the power grab of our time. Congress, not the President or the Courts, is charged with the power to spend the money.

"We cannot sit on our hands and watch the President shred the Constitution and ignore the will of the Representatives of the American people. We must let everyone know that this body looks out for the interests of the American people, not the Government of Mexico...." (*Congressional Record*, February 6, 1995, pp. H1215-H1216.)

The CIA Warned the White House in July of 1994 About Peso Crisis

Mr. D'Amato: "Mr. President, last week, the President of the United States went around the will of the people to bail out a mismanaged Mexican Government and global currency speculators. That was wrong.

"I am outraged that American taxpayers are being forced to do something they did not want to do. The President went around the people knowing that Congress would not approve a \$40 billion bailout of Mexico.

"Never before has a president used \$20 billion from our exchange stabilization fund to bail out a foreign country. The ESF is not the President's personal piggy bank. This fund is supposed to be used to stabilize the dollar, not the peso. The President was wrong, and I am outraged.

"The President has used scare tactics to justify going around Congress to bail out Mexico. The President claimed that world stock markets would crash and floods of illegal immigrants would cross our borders. The President was wrong, and I am outraged.

"As former FDIC Chairman Bill Seidman testified last week, Mexico's credit crunch can be solved by letting the market work. Mexico and its creditors should be forced to renegotiate its debt. That's the capitalist way. Investors in Mexico might get 50 or 60 or even 70 cents on the dollar. That is fair. Investors in Mexico took a gamble. If they wanted a United States-guaranteed investment, they should have put their money into a 6-percent C.D., not a 20-percent Mexican pesobono.

"The President has given in to economic blackmail. Will American taxpayers have to send Mexico \$40 billion next time to protect our borders from illegal immigration? I am outraged that the President has used our exchange stabilization fund to pay blackmail to Mexico.

"The President has set a terrible precedent. What happens next time the peso collapses? What happens when some other country's currency collapses? The American taxpayer cannot afford to be the world's banker. We cannot afford to bail out global currency speculators every time a foreign currency collapses.

"The President should not be sending \$20 billion to Mexico when Congress must cut United States domestic programs to put our own economic house in order. The Governor of my home State has to cut \$5 billion from the state budget. We should send \$20 billion to New York or Florida or California or other States that are in need before we send it to Mexico.

"Make no mistake about it. Two years from now. Five years from now. I predict that this bailout will go down as one of the President's biggest blunders.

"I predict that this bailout will not work. It is a quick fix and will come back to haunt American taxpayers. They will wind up paying.

"Let us look at the facts.

"Mexican political bosses got into this mess to win the August 1994 election. They printed pesos at an outrageous rate. They created the illusion that the Mexican economy was still thriving, and then they devalued the peso. That was wrong. It hurt poor and middle-class Mexicans. We should not bail out mismanaged foreign governments.

"The President's plan will not force Mexico's ruling party to make needed economic or political reforms. Once our money is shipped to Mexico, we will have no leverage.

"Let us look at some of the promises Mexico has made for the \$20 billion of American taxpayers' money – promises Mexico cannot keep.

"Mexico has promised to keep inflation low. But they cannot do that. The peso's devaluation has set off 20 to 30 percent inflation, and the Mexican Government will have to keep printing pesos to prevent more unrest in Chiapas.

"Mexico has promised to cut spending and to maintain a budget surplus. But that is impossible. Mexico must pay sky-high interest on more than \$160 billion in debt and faces a recession.

"Mr. President, let me ask the question. If we cannot balance our budget here, here we are promising \$20 billion to Mexico, not a loan guarantee. We are going to give it to them. We say as one of the conditions we expect you to have a budget surplus. I ask, is that realistic? We cannot balance a budget here. We are not saying Mexico is going to have a budget surplus. That is ridiculous. It is ludicrous. And no one could promise you that would take place.

"Mexico has promised to raise \$12 to \$14 billion through privatizations. But who is going to invest in Mexico now? How are they going to bring about privatization?"

"I am outraged that the President's bailout of Mexico will leave American taxpayers holding the bag. Now, when we have to make painful cuts in the Federal budget, is not the time to be risking American taxpayers' money."

"The administration assumes that Mexico will pay off its debt. But Mexico could not pay back United States banks in 1982."

"The President claims that assured sources of repayment exist. But if assured sources of repayment really existed, banks and private investors would provide money to support Mexico's debt."

"The President has not obtained real collateral. Mexico has already pledged its oil reserves as collateral for its existing debt."

"The President relies solely on a security mechanism involving the New York Fed. But this security mechanism is a mirage. It goes into effect only after a default. Mexico can sell oil only to customers who do not pay through the New York Fed."

"When Congress provided \$1.5 billion in loan guarantees to New York City and Chrysler, Congress demanded much more collateral. I am shocked and outraged that the President has not demanded more collateral from Mexico for \$20 billion."

"What will the President do if Mexico refuses to pay us back? Will the President send in the 82nd Airborne to seize the oil fields? Of course not. It is preposterous. Will he try to raise U.S. taxes to replenish our exchange stabilization fund?"

"The President's bailout will not win us friends south of the border. Already the Mexican people resent the fact that we are making those moneys available on conditions that they speak about. Most Mexicans oppose the \$40 billion bailout."

"The administration says that it was taken totally by surprise when Mexico set off this crisis by devaluating the peso on December 20. "But the signs of serious trouble in Mexico were present months ago. Congress must determine what the administration knew about Mexico and when."

"The New York Times, January 24, 1995, reports that the CIA advised the administration in July 1994 – 6 months before the peso's devaluation in December – that Mexico's ruling party was borrowing and spending at a furious pace."

"We have an obligation to investigate whether the administration's inaction or silence caused this crisis. We must find out if the administration advised Mexico to devalue the peso. Devaluation was a terrible mistake. We all admit that now. But who was there and when? What advice did this administration give, if any, to the Mexican Government?"

"On January 26, Senators Dole, Lott, Mack, and Abraham asked for documents concerning the administration's advice to Mexico on currency devaluation. Twelve days later, we still have not received these critical documents.

"Why have we not received these documents? When will we get them? What is the administration hiding? The American people have a right to know.

"The Banking Committee will hold oversight hearings on the administration's use of the ESF to bail out Mexico.

"Senator Mack and I will introduce a sense-of-the-Senate resolution that the Treasury should, in conjunction with the minority reports required by the ESF statute, provide the Banking Committee with monthly information on: First, economic conditions in Mexico, and second, how Mexico is spending the \$20 billion.

"American taxpayers have the right to know whether their money is being wasted in Mexico. They have the right to know if the Mexican Central Bank has slowed the peso printing press. They have a right to know if Mexico has stopped spending and balanced its budget.

"We must hold the administration's feet to the fire. We must blow the whistle if the administration does not make Mexico live up to its commitments – to stop the peso press, to balance its budget and to privatize. We must fight for middle-class American taxpayers, not for mismanaged foreign governments and global currency speculators...." (*Congressional Record*, February 8, 1995, pp. S2324-S2325.)

Chase Manhattan Bank Worried about Potential Losses in Mexico

Mr. Defazio: "Madam Speaker, a lot of news is about trade today and it is all bad or it is bad if you care about the economic future in the United States and you care about the conditions of working people and wages in the United States. [It] might be good if you are a multinational corporation and looking for cheap labor elsewhere and looking for ways to profit. But not to further the future and the economic prosperity of our own Nation.

"The administration is very proud they finally struck a deal on the Mexico bailout. Great deal: \$20 billion, \$20 billion up front from the United States of America. Mr. Kantor, the special trade representative, is downright proud that we were able to get this deal. And it is a really bad deal for people on both sides of the

border, it is an incredibly bad deal for the people of Mexico. It is expected that it will cause a recession in Mexico, it will drive interest rates up to 50 percent in Mexico, it will cause businesses to fold in Mexico because most of them have adjustable loans so their rates are going up dramatically and quickly.

"Banks will fold in Mexico. And wages are now at 40 percent of the level of 1980, despite the increases in productivity.

"Well, maybe it is a good deal on our side of the border and that is why he is so happy. Well, maybe not.

"First off, \$20 billion at least. We do not know how much money the Federal Reserve has secretly shipped to Mexico, how much we are involved in the funds coming from the international institutions.

"But it is a lot of money. And money that could have been spent productively here at home.

"But beyond that we have some analysis now, analysis by DRI McGraw Hill, a private consulting firm in Lexington, Massachusetts. It says that U.S. exports to Mexico will drop by \$10 billion this year, leading to a loss of 350,000 U.S. jobs. So we are going to pay \$20 billion of our taxpayers' money to ship 350,000 family-wage jobs to Mexico. Now that is a great policy.

"But they tell us do not worry, it is all short term, it all will get better. In fact, Chase Manhattan has a memo and its says quite frankly they can fix the problems down there in Mexico, they just have to do a couple of things. The government will need to eliminate the zapatistas to demonstrate their effective control of the national territory and of security policy, if they want to encourage further investment in Mexico.

"It seems Chase Manhattan is pretty upset that they wagered – and that is what this is about – wagered a huge amount of money in Mexico trying to get obscene rates of return. Now they are upset that the junk bonds they bought have turned truly to junk and are worthless.

"These are policies that are not in the long-term interests of the United States of America, nor the people of Mexico. It is time that we began to get straight about our trade policy in this country.

"I introduced legislation earlier this year to repeal the benighted NAFTA Agreement, and at the time people thought, 'Well, that is a pretty far-out thing.' I would say, given the events since then, given the massive bailout, given the huge loss of jobs we now admit we are going to suffer into the indefinite future, is it not time to revisit that agreement?"

"It is not good for people on either side of the border. It causes tremendous harm.

"Let us rip it up and start over again...." (*Congressional Record*, February 21, 1995, p. H1955.)

The Federal Reserve Board is Subject to the Jurisdiction of Congress

Mr. Traficant: "Mr. Speaker, the Constitution says only congress can draw money from the Treasury. It also says only Congress can coin money and regulate the value thereof and regulate the value of foreign money. Only Congress, the Constitution says, can regulate commerce with foreign nations.

"The question I ask, Congress, is under what authority did Robert Rubin sign an agreement to bail out Mexico? To me it is unbelievable.

"Now, the Washington Times reported that our bailout is going to bail out the Mexican banks and Mexican companies. Ladies and gentlemen, we are bailing out Mexican banks, we are putting our banks on the line here and our taxpayers in the fire.

"I disagree with this. I think the Federal Reserve Board is subject to the jurisdiction of Congress, not the White House. It is time for a constitutional court case to determine it.

"I plan to challenge the bailout in court." (*Congressional Record*, February 22, 1995, p. H1972.)

Wealthy Remove Money from Mexico

Mr. Roth: "Let me say this. This is one small step in the right direction, one very small step. I think it is important for us to get the information from the administration. This is a \$20 billion bailout. The Republicans made a Contract With America and Clinton made a contract with Mexico. But I guess what really bothers me is that this is going to be tough on the American taxpayer and the people of Mexico. It is a win-win for the billionaires. There are more billionaires per capita in Mexico than any other country in the world and they are coming out in great shape. They took \$3 billion out of Mexico before the devaluation. We also find out that Templeton, the day before the collapse, took their money out of Mexico. All the smart money left Mexico. But Clinton put American taxpayers' dollars into Mexico. That is what bothers me. I think it is important to point out that this is working Americans' taxpayer dollars.

"Mr. Speaker, all the smart money got out of Mexico. Then our Government went into Mexico. It is like rowing out to the *Titanic* and getting onto the ship and wondering why everybody else is going the other way. This is not smart policy.

We are never going to see this \$20 billion. This is a stabilization fund. What happens if our dollar gets into trouble? We could have used these billions of dollars to shore up our dollar. What happens when our dollar goes down as it has gone down in the past? What are we going to do to shore up the dollar? This is going to have far-reaching implications...." (*Congressional Record*, March 1, 1995, p. H2448.)

An Elite in America Attempting to Run the government

Mr. Rohrabacher: "I agree with you. There is an elite in the United States of America who think that they own this country, and they do not own this body.

"We may be spending tens of billions of dollars right now, but the people will be heard. This is the first step toward making sure that the people's voice holds sway in Washington, DC, and the Nation's Capital.

"Those Americans who are listening to us right now should make sure that they contact their Representative and write the White House and make sure that the leaders here in Congress and in the executive branch get the message that we have got to stop shoveling money south of the border, stop paying off Wall Street speculators.

"They want a balanced budget. The American people want a balanced budget. And we are betraying everything that they want...." (*Congressional Records*, March 1, 1995, p. H2453.)

A Major Economic Crisis is Brewing

Ms. Kaptur: "Madam Speaker, I wish to associate myself with the remarks of the prior speaker. There is no question that the value of our Nation's currency on international markets is a measure of our Nation's economic health. And over the past few days and weeks, our dollar has hit historic lows against currencies of all the nations that we trade with. In fact, it is at the lowest level, our dollar's value, since World War II. That is a longer time than many people in this Chamber have been alive, so it has not been at this point for decades.

"The dollar's exchange value stands at a scant 92.8 yen to the dollar. I can remember when it was 240 yen to the dollar and 1.4 German marks against the dollar. In other words, the dollar is not looking so good to the rest of the world. It is losing its value. It is looking cheap.

"Little that our Treasury Department or Federal Reserve have been able to do over the last few days to give the dollar a boost has worked. In fact, they put over \$2 billion into buying currencies around the world over the weekend and it did not do any good. Did not do any good, had no impact on stopping the dollar's further decline.

"Now, what does this really mean to families in our Nation? It means that our money, our people's money, cannot buy as much, not just here at home, but abroad. It means that interest rates in our country rose seven times over the last 12 months, even though most people were going, well, why are interest rates going up? There is really no inflation. What is happening here? Banks are raking in good money off of our people, and though there is no inflation on the horizon, we see that our Nation is raising interest rates to attract money from other places because our money is not worth as much.

"In fact, we are now, the United States of America, the largest debtor nation in the world, and through NAFTA, we linked ourselves to Mexico and Canada, and North America is now the largest debtor continent on the face of the planet.

"And the markets know it. For 15 years our country has been importing vast amounts of merchandise, more than we exported. In fact, last year, 1994, we had the largest merchandise trade deficit in the history of our country; as Congressman DeFazio referenced, over \$166 billion more of goods coming here than we sent out.

"In effect, what we have, we have a decapitalization of the United States of America; production that used to be done here is being done somewhere else. We are importing all this stuff and then we have to pay for it with borrowed money. Doesn't sound like very smart policy to me.

"Last year, our deficit with Japan went up even more, to over \$65 billion. Our deficit with China went up to nearly \$30 billion, and the former surplus that we had before NAFTA with Mexico dried up and went into the negative numbers in October and November of last year, and with the incredible devaluation of the peso, it is estimated that this year of 1995, the United States will yield nearly \$15 billion more of trade deficit in the red with Mexico.

"In other words, Mexico will be sending more goods to this country than we will be sending down there. That is not how NAFTA was supposed to work. It is clear that since the middle of February, and like Mr. DeFazio, I have a chart that shows the value of the U.S. dollar going down. Since the mid-1980's until the most recent period here after the Mexican peso was devalued, to which we have not linked ourselves inseparably, the value of our dollar has dropped at the fastest rate in the history of our country, and like Mr. DeFazio, I am shocked there are no emergency hearings in the Congress. There is no word from the White House. At least the newspapers are reporting, and it has been in top headlines in USA Today,

in the New York Times, in the Wall Street Journal. You think Washington fell comatose on this one.

"There is a major economic crisis brewing, and money is flowing out of our Treasury to try to prop up the Mexican peso, a few billion dollars. Actually there is more money that has flowed out of the Treasury to prop up the Mexican peso than money has flowed out of the Treasury to prop up the United States' dollar in international markets, we learned this morning. What happened today? Peso went down again in terms of its own value....

"Madam Speaker, let me just say in closing, is not it time someone in this House rang the alarm bell to say enough is enough, and I call on Speaker Gingrich to allow our bills to move to the floor to stop the further outflow of taxpayer dollars to Mexico...." (*Congressional Record*, March 7, 1995, pp. H2787-H2788.)

The Mexican Peso Bailout debacle is a classic example of the "Arrogance of Wall Street" and their total disregard for the American people. It also reveals the close working relationship between Wall Street and key politicians in Washington, D. C. who are beholden to the financiers for campaign contributions and support. The powerful forces on Wall Street were once again allowed to pillage the American taxpayer out of billions and billions of dollars.

Part IV Global Interdependence – Spinning a Web of Control

7. The Emerging Global Community

Beginning with Plato and his philosopher-kings there have been various attempts to fashion a new world order or global community. Attempts to create a world state have included the Amphictyonic Council of the Greek States in 1497 B.C., the Lycian Confederacy in 1400 B.C., the Achean League in 281 B.C., the Hanse Towns organization in the twelfth century, the Helvetic Union in Switzerland, the Grand Design of Henry IV of France and Elizabeth I of England, and the Holy Alliance of the Emperor of Austria and the king of Prussia in 1815.

The League of Nations

Between 1815 and 1920 a steady stream of literature advocated a united world of peace and prosperity. At the end of World War I the League of Nations made its abrupt appearance. The League contained much of the same machinery as the Grand Design and proved a failure just as earlier attempts to create a world state had also proved unsuccessful.

The United Nations

At the end of World War II the United Nations organization suddenly burst into the international arena and once again visions of a world state spread throughout the nations of the earth. The success of the United Nations as a mechanism to achieve world peace has been questioned by many scholars who feel that the U.N. has disappointed their "internationalist superhopes."

Movement Toward Supra-National Rule

Movement toward the creation of some type of supra-national world order has greatly intensified in the 20th century. This intensification has, no doubt, occurred because of tremendous technological advancements in practically all areas in a relatively short span of time.

Utilizing innovations in communications and travel – from streamlined Concordes to world satellites that seem virtually to shrink the size of the earth – a number of prominent, influential men of the world have undertaken what Harlan Cleveland terms the 'third try at world order.' To assist them in their development of new or renovated supra-national institutions for the governance of the emerging global system, these men have called on universities and colleges, think tanks, private organizations, media conglomerates, individual nation-states, multinational corporations, international banks, and other international institutions. Cleveland

calls these future leaders of the developing international system the "consortia of the concerned." (*Ibid.*, p. 79.)

Joint Effort of Public and Private Organizations

Development of the emerging global system is being encouraged by a multitude of organizations both public and private. Among these are the Trilateral Commission, the Council on Foreign Relations, the Foreign Policy Association, the Royal Institute of International Affairs, the German Society for Foreign Policy, the International Affairs Institute, the Swedish Institute of International Affairs, the Aspen Institute for Humanistic Studies, the Atlantic Institute for International Affairs, the Bilderberg Meetings, the Ford Foundation, the Rockefeller Foundation, the German Marshall Foundation, the Guggenheim Foundation, the Organization for Economic Co-operation and Development, the Atlantic Council of the United States, the Brookings Institution, Rand Corporation, Exxon, General Electric, Xerox, Mobil, Standard Oil of California, Sony Corporation, Texas Instruments, Royal Dutch Shell, I.T.T., the Chase Manhattan Bank, the Bank of America, Citicorp, Deutsche Bank, Banque Nationale de Paris, J. P. Morgan and Co., the International Monetary Fund, General Agreement on Tariffs and Trade, the International Bank for Reconstruction and Development, the European Economic Community.

Great Vigor Attends Construction of a Global Community

Today's emerging international system is extending its influence at a speed that is almost breathtaking, considering the expansive nature of the global system under construction. Efforts to construct a world order or global community have never been attended with more vigor and determination than at present.

Piecemeal Functionalism

Those who travel in high circles – the international elite – are finally seeing an emerging global system beginning to take concrete form, following years of deliberation and trial and error. Construction of the global community is taking place institution by institution, a process termed 'piecemeal functionalism' by the Trilateral Commission.

One of the Commission's *Triangle Papers* elaborated on this concept as follows:

"In general, the prospects for achieving effective international cooperation can often be improved if the issues can be kept separate – what we call piecemeal functionalism. Progress on solutions is likely to be faster and the solutions are likely to be more durable.

Cooperation on a Functional Issue Basis

"Where cooperation on a functional issue offers all participating countries potential specific gains, these gains are most likely to be achieved by focusing on the issue in question rather than combining it with negotiations cutting across many areas. By narrowing the negotiation, it can be kept concrete and deal with specific arrangements and procedures. In such cases, specialists (who are more likely to dominate more limited discussions) may be better able to reach agreement than political generalists for whom issues are more likely to become symbolic of victory or defeat for particular national or regional political viewpoints. Specialization creates common bodies of knowledge and intellectual frameworks among experts from many nations. Coalitions of specialists can be built across national boundaries in specific functional areas, blunting the nationalism that might otherwise hinder international agreement. These factors do not mean that the issues may not be 'political' or involve political choices. Indeed, the choice of specialist negotiations is itself a political decision. It is a matter of how political leadership is exercised.

Wisdom of a Piecemeal Approach

"This guideline can be illustrated in several issue areas of current or recent importance. The failure of attempts, after the disintegration of the Bretton Woods system, to draw up a comprehensive detailed blueprint applicable to all participating countries suggests the wisdom of a more piecemeal approach, concentrating on improvements on the arrangements we already gave. It is not clear that current law of the sea negotiations, which combine all the issues, represent the best path toward improved oceans management. The effort to construct a comprehensive package deal in these drawn-out negotiations hold in suspension agreement in particular areas and has frequently raised these issues above a specialist level of consideration. Solid progress might have been greater with a more piecemeal approach, an approach to which some countries may revert if the construction of an overall package collapses....

Three Types of Linkages

"We do not underestimate the difficulty of separating issues for the purposes of discussion or negotiation. Nor do we mean that issues should always be divided as finely as conception allows. Many linkages exist among seemingly diverse issues. Three types of linkages may be distinguished. First are technical, inherent linkages that obviously cannot be avoided. Second, linkages are sometimes made for bargaining purposes, especially where a party, which has little leverage on the specific issue, has more on another. In the jockeying leading to the Paris negotiations in the Group of 27, between the advanced and developing countries, the OPEC states used their leverage to insist on the wider agenda of economic

issues. Third are comprehensive approaches, joining together large numbers of issues over a very broad field, such as the negotiations on the law of the sea.

Advantages of Functional Specificity

"The advantages of functional specificity are borne out by the experience with international institutions. As argued in an earlier report, 'functionally specific international organizations succeed far better than multipurpose organizations in accomplishing concrete tasks....' This is clearest for essentially nonpolitical issues, such as those handled by the Universal Postal Union and World Health Organization. But it is also true for the functionally specific economic institutions, such as the IMF and GATT.... The same countries which will often indulge in fanciful rhetoric in a broad, multipurpose organization (such as various UN agencies) will often be negotiating seriously and cooperatively in another organization (such as GATT) on the same issue at the very same time. The more technical focus, and lesser public awareness, of such organizations promotes such a result.... [B]roader, multipurpose groups (such as the United Nations) also have an important – though quite different – role to play. They are better than functionally specific groupings for legitimizing broad new concepts. They may be able to coordinate the activities of many functionally specific organizations.... They enable governments to transmit their political concerns, and convey their domestic political pressures, without fear of jeopardizing progress toward concrete goals. Their wide-ranging debates can help set future agendas for functionally specific organizations." (Richard N. Cooper, Karl Kaiser, Masataka Kosaka, "Towards a Renovated International System," *The Triangle Papers: 14*, New York: The Trilateral Commission, 1977, pp. 32, 33-34.)

Brzezinski Calls for Shaping a Genuine Framework for World Order

One of the most outspoken advocates of a "new world order" is Dr. Zbigniew Brzezinski, former Director of the Trilateral Commission and former National Security Advisor in the Carter Administration. In an conducted by James Reston, printed in *The New York Times Magazine* of December 31, 1978, Dr. Brzezinski stated:

"We are engaged in shaping a genuine framework for a cooperation for a world that, for the first time in its history, has become politically active and awakened....

"Today, in the ultimate sense, national security means an active and positive engagement by the United States in shaping a rapidly changing world in ways that would be congenial to our interests and responsive to our values....

Need for Active Shaping of New and Wider Global Institutions

"I think we are now beginning to realize that there is no such thing as simply maintaining the status quo in order for American values and the American system

to survive. I believe strongly that more people appreciate the fact that to make the world congenial to ourselves, to prevent America from being lonely in the world, we have to be very active in shaping wider and new global institutions, wider and fairer patterns of global cooperation. This is why we have to shape new arrangements to give so many new participants in the global political process a genuine opportunity to participate....

"There is...a redistribution of both political and economic power in the world today....

Shift in Economic Power

"There is...a displacement in roles taking place. It is accompanied by shifts in concentration of economic power....

"Today military power is split between the West and the Soviet Union. Economic power is becoming more dispersed. There are new clusters of financial wealth and influence which are imposing enormous strains on the existing monetary system. All of that brings me back to my basic and central message. The fundamental national-security policy of the United States has to be one of active involvement in shaping this variety of forces into a cooperative framework....

Close Consultations with Japan and Western Europe

"We cannot shape them alone, and this is why we have put more emphasis than our predecessors on closely consulting with the Europeans and the Japanese, who are at a similar stage of development and have similar political values. Secondly, emphasis must also be placed on consulting very closely with the newly influential countries of the world – Venezuela, Brazil, Nigeria, Saudi Arabia, India." ("The World According to Brzezinski," *New York Times*, 1978, pp. 9, 10.)

Regional Groups in the Middle East

In reference to regional groups in the Middle East Brzezinski stated:

"Peace is in the interest of the United States.... But it is also in the interest of Israel, of the moderate Arab countries and of the Palestinian people – who cannot be ignored – that there develops a pattern of regional cooperation ranging from Iran even all the way to Morocco and from southern Arabia to the shores of the Mediterranean with the West. If there is such peace in the region, not only will the Arab countries be able to modernize rapidly but I have not the slightest doubt that Israel will become the Switzerland or the Singapore of the region, and, therefore, there is a real opportunity for Israel to flourish the way its founders dreamed." (*Ibid.*, p. 11.)

World Role for the United States

To the question concerning the real role of America in the world, Dr. Brzezinski responded:

"In my judgement the real threat to the future is not that the world will someday be painted a single color – red – under a single flag – that of the Soviet Union. I don't think the Soviet Union has either the ideological capacity or the economic power or even the military resources to impose global domination. I think the real danger to today's world is that the conflicting aspirations of man will create massive global chaos and fragmentation.

U.S. Role in Dealing with the Soviet Union

"I am fearful that the Soviets might be tempted to exploit this in a shortsighted fashion to complicate these difficulties. Because of that, it seems to me, the proper role of the United States is (1) to deter Soviet military power; (2) to engage the Soviets in wider cooperation and to engage them in a constructive response to the global condition; (3) to harness the shared beliefs of our allies and friends to make the world political system genuinely more just and participatory, and (4) to try to create global policies which are responsive to the fact that the global population is now politically awakened and in most cases living in very unfair conditions.

Shaping Future Power Centers

"This means ultimately an active effort genuinely to shape a stable world of diversity with centers of power and many ideological systems coexisting – a world which doesn't correspond to the 19th-century doctrine of a single system for the world as a whole, a notion which is totally unrealistic and meaningless. I am optimistic about our role because I think our visions of the future and our definition of our role corresponds more accurately to genuine global dynamics than that of the Soviets or the others." (*Ibid.*)

U.S. is a Microcosm of the World

In reference to the world of tomorrow, Dr. Brzezinski believes:

"America, precisely because it is a country which is not united by an organic past but by shared future, is a microcosm of the world. The world is not united by a common past but increasingly it has a common future, which is going to be either bad or good. America proves that people can come together, cooperate on behalf of central ideas. When we came together as a society, the notion of liberty was in the air only in Western Europe and along a small band of 13 states. We managed to create a society which in effect was a framework for 200 years of sustained efforts to implement this concept of human liberty. We have created a framework for seeking to implement the idea of human liberty.

U.S. Gradually Spinning a Web of More Cooperative Relationships

"Today the world needs a framework for the fulfillment of the ideas of human liberty and human justice. I think we can offer a great deal to the shaping of such a popular framework, not by domination, not by a Pax Americana, but (1) by repelling the imposition of ideological orthodoxy on the world, which nobody desires and from which nobody would benefit and (2) by gradually spinning a web of more cooperative relationships. Not only with our traditional friends but also with the new countries. And then, last but not least, with our adversaries. I consider that to be the central task of our policy.

Active Role for U.S. in Shaping Worldwide Cooperative Institutions.

"Beyond that, of course, you can reduce it to more specific levels. It is to provide the umbrella of defense for Western Europe. It's to resolve the Middle Eastern problem and to tie the Middle East into a cooperative relationship with the United States and Japan. It is, of course, to secure the Persian Gulf. It is give China a meaningful role in a nonhegemonic world through friendship with us. So, as you go down from the general to specific, the policy purposes become more precise. But they are all related to the President's central message, which I cannot reiterate strongly enough, that America's role today has to be that of active engagement in shaping worldwide cooperative institutions. And to say that means repelling security threats, maintaining our own ability to influence others politically, economically and militarily, encouraging regional clusters of power and insisting on ideological and philosophical diversity." (*Ibid.*)

Future Linkage of Trilateral and Communist World

In discussing future linkage of the trilateral world with the communist world Dr. Brzezinski added:

"I don't feel that there is a fundamentally unbridgeable abyss between the West and the Russians. I think that ultimately, if we are patient and persistent, we can bring about with the Soviet Union, despite the military-ideological competition, a relationship of more genuine cooperation. And that should be one and is one of our key objectives." (*Ibid.*, p. 26.)

Regional Groupings in the Western Hemisphere

In reference to regional groupings in the Western Hemisphere, Dr. Brzezinski stated:

"We have deliberately chosen...to pursue a policy of treating Latin American countries as mature partners on a bilateral basis in most cases, as we do with Europe and Asia; on a regional basis when needed (and we have made real strides in developing Caribbean cooperation); and on a global basis in regard to those

problems which Latin America shares with other developing countries. I think we have made real progress.

Improving Relationships with Venezuela and Brazil

"Beyond that, we have done well in improving our relations with Venezuela. We are now moving forward in our relations with Brazil and Americans should be aware of the positive developments toward genuine democracy in Brazil. We have a good long-term relationship with Brazil, which happens to be the only country which fought with us shoulder to shoulder in World War II.

Need to Shape Joint U.S.-Mexican Policies

"And, last but not least, we need to improve our relationship with Mexico, lest by the end of the century we have 120 million people to the south who will not be our friends. We have a lot in common with Mexico, and we could have a creative relationship of community if we are farsighted and if we work closely with the Mexicans themselves in shaping joint U.S.-Mexican policies on the issues between us: trade, migration, natural resources." (*Ibid.*, pp. 26-27.)

Brzezinski's Ambition to Shape the World Role of the U.S.

Herman Nickel asserts in a recent article in *Fortune* magazine that the European-born Brzezinski is driven by an ambition to use his academic career as a springboard to "shape the world role" of America. He notes that it was Dr. Brzezinski "who took on the normalization of relations with Peking, and coped with the final stages of the Iran crisis...." ("Why 'Zbig' Is Not Quite on Top of the World," *Time* Apr.23, 1979, pp. 71-72.)

Construction of a New World Order That Will Eventually Confront the Soviet Union

Nickel outlines Dr. Brzezinski's view on the emerging global community as follows:

"Brzezinski envisages the building of a new international order that would in the end confront the Soviet Union with a choice to join or to compete – a choice, in the blunt words of the President's Annapolis speech of June, 1978, between 'confrontation and cooperation.' At the core of this world order would be the trilateral relationship between the advanced industrial democracies of the U.S., Western Europe, and Japan. This trilateral union also would have to reach out to the Third World in a cooperative relationship to help it fulfill its economic and political aspirations – in return for the energy sources and raw materials on which the industrialized countries depend.

Regional Influentials

"To buttress this relationship, Brzezinski would assign special roles to the 'regional influentials' – his academic and ungainly jargon for local power centers around which neighboring countries could cluster and join the U.S. and its allies in common endeavor. The countries cited by Brzezinski for such regional leadership include Mexico, Venezuela, and Brazil in Latin America; Nigeria in Africa; and in Asia, India – and 'very much' 'China.'" (*Ibid.*, pp. 72-73.)

Two Very Prominent Organizations Promoting World Order Concepts

Two of the most prominent organizations in the western world advancing concepts for a global community are the Council on Foreign Relations and the Trilateral Commission. The Council could technically be called a "spawning ground" for world order concepts, and the Commission a "task-force" for implementation of those concepts.

The Trilateral Commission

The Trilateral Commission holds regular meetings in various parts of the world, in which it discusses various policy oriented task-force reports. Trilateral task forces are comprised of high-level academicians from Europe, Japan and the U.S. At the Trilateral meetings the task-force reports, which contain policy recommendations of the Commission, are discussed and summarized. They are then published as monographs, and are called *Triangle Papers*. Although the *Triangle Papers* receive little public attention, they have had a tremendous influence on government policy-makers and high-level academicians.

Reform of International Institutions

In *Triangle Paper* No. 11, "The Reform of International Institutions," the authors stated:

"Mankind has turned increasingly to international institutions as interdependence among nations has grown. Communications and health were among the first concerns where national borders became obsolete, and successful international organizations were created. The horrors of the First World War produced the League of Nations, the planets first effort to organize for its collective security. The Second World War triggered the creation of the United Nations, to pursue the same objective. The lessons of the Great Depression, which caused massive human tragedy and accelerated the slide toward renewed armed conflict, stimulated the creation of a wholly new set of international institutions aimed at providing the world with collective economic security." (C. Fred Bergsten, George Berthoin, Kinhide Mushakoji, New York: Trilateral Commission. 1976, p. 1.)

Making the World Safe for Interdependence

The authors, C. Fred Bergsten, George Berthoin and Kinhide Mushakoji, also expressed the view that:

" A major lesson from the past is that international institutions can make the world safe for interdependence and indeed are necessary to avoid efforts by individual nations to export their internal problems to each other. Hence all issues of international interdependence should be brought under the governance of effective international rules and institutional arrangements. Several new institutions need to be created to deal with topics newly critical to international interdependence. A new institution is particularly needed to govern foreign direct investment and multinational enterprises. One set of problems here derives from the global scope of operations of multinational firms, exceeding the jurisdiction of any individual government. The second concerns the need for rules to check the efforts of national governments to seize for their own countries a disproportionate share of the benefits generated by foreign direct investment. New arrangements are required on several fronts in the area of commodity trade. Commodity agreements, with buffer stocks to defend floor and ceiling prices alike, will be the best answer for some products. The proposed International Resources Bank could help smooth the flow of investment capital into producing countries and help assure adequate output over the longer run.

Needed Reform in Several Existing International Institutions

"Several existing international institutions need reform. New arrangements are needed in the General Agreement on Tariffs and Trade (GATT) to govern export controls, like the rules which have for a generation governed import controls. The GATT needs reform in a number of other areas as well. The International Monetary Fund (IMF) needs new arrangements to effect multilateral surveillance over the system of flexible exchange rates and control over the growth of international liquidity. For the first of these two purposes, a permanent committee should be created within the Fund to monitor exchange markets constantly and develop norms against which to assess national interventions. For more control over liquidity, a Reserve Substitution Account should be created through which national monetary authorities could convert their current reserve assets into Special Drawing Rights. SDRs were developed in the late 1960s to permit effective control in this area, but have fallen into disuse.

Need to Think in Terms of Managing a Single World Economy

"The OECD should strengthen its process of consultation on the policy plans of the major industrialized countries and the likely interactions among them. The economic officials of at least the largest countries must begin to think in terms of managing a single *world* economy in addition to managing *international* economic relations among countries. In the area of development assistance, a consolidated

'world development budget' should be constructed each year and discussed actively by donor and recipient countries, perhaps in the World Bank, as they formulate their plans. This budget might then be coordinated with other developmental policies in the United Nations.

The Greatest Danger to International Stability

"History has shown that the greatest dangers to international stability often arise from those nations whose real power is inadequately reflected in the relevant sets of international arrangements and symbols of status therein. Such nations can challenge the legitimacy of the system with actions as well as rhetoric.

Need to Bring Developing Countries into Current Phase of Institution Building

"Much of the current call for a new international economic order flows directly from such concerns, and a major need in the current phase of institution-building is to bring developing countries into effective participation in the international system. First, serious and sustained attention must be paid to their substantive concerns. In terms of broad objectives, this requires the international economic system, to attach priority to issues of income and wealth distribution as well as the more traditional goals of efficiency and growth. A second essential step is to provide major developing countries with a role in the international decision-making process which corresponds to their sharply increased importance to the system. A third step is to go still further and bring selected 'newcomers' into the inner circles of international decision-making." (*Ibid.*, pp. v-vi.)

Toward a Renovated International System

In 1977 the Commission published *Triangle Paper* No. 14, entitled "Towards a Renovated International System." The authors of this report, Richard N. Cooper, Karl Kaiser and Masataka Kosaka, declared:

"The most pervasive characteristic of the current situation is the steady expansion and tightening of the web of interdependence. Management of interdependence has become indispensable for world order, particularly given its dual character: Intensive interaction between societies at various levels is essential for economic well-being, but it produces or threatens mutual interference across national frontiers, interference which may jeopardize its very advantages. Interdependence complicates the management of the modern welfare state, transmitting problems from other countries and interfering with national priorities and policies. Conversely, the management of interdependence is inevitably complicated by conflicting national priorities. Moreover, current arrangements are severely criticized by many developing countries, which demand a greater say in international decision-making and a more equitable sharing of benefits from the world economy.

"The requisite cooperation for both the short and long term must be based on the shared conviction that it maximizes overall gain and increases the welfare of all those involved. Such cooperation faces major obstacles, however, which a realistic strategy must take into account: the desire for national autonomy, the impact of domestic politics, disparities in conditions among countries, and the sheer number of countries.

A Broad Strategy for Management of Interdependence

"What principles should guide the trilateral countries in their approach to management of our increasingly interdependent world? With its numerous complexities and uncertainties, the temptation will be strong to adopt a completely pragmatic approach; in short, to 'play it by ear.' The trilateral countries should surmount this limited view and have in mind a broad strategy for the management of interdependence. At the same time, however, large-scale detailed blueprints for action are too ambitious at present and likely to lead to no action." (New York: *The Trilateral Commission*, 1977, p. vii.)

Management of Interdependence Indispensable for World Order

From the trilateral viewpoint "management of interdependence has become indispensable for world order." (*Ibid.*) In other words, besides the erection or renovation of international institutions, one of the greatest dilemmas facing the global architects of today is governance of the emerging system.

The 1980s Project of the Council on Foreign Relations

One of the most ambitious projects on "governance" in the western world was undertaken by the Council on Foreign Relations in the form of its "1980s Project." The purpose of the project was to explore the nature of political, economic and social arrangements among nations that would be desirable during the 1980s and 1990s.

Council on Foreign Relations Monograph on Management of Interdependence

One of the forerunner steps in the 1980s Project was the Working Group on International Order, which met under the auspices of the Council during the period of October 1971 to June 1973. The Chairman of the Working Group on International Order was Miriam Camps. In 1974 the Council published a monograph by her entitled "The Management of Interdependence: A Preliminary View" as part of a series of Council Papers on International Affairs. Richard H. Ullman, writing in the preface to Camps's monograph, stated:

"For the Council on Foreign Relations, Mrs. Camps's paper is an important first publishing step in, and a catalyst for, what promises to be a long and searching

enquiry into the prospective international environment of the 1980s and the policy choices that will face the United States and other societies." (Preface. New York: Council on Foreign Relations, 1974.)

Nudging Things toward a Particular Kind of International System

Miriam Camps begins her monograph with these words:

"The approach of this essay is deliberately different. In it I have tried to look at the kind of international system toward which we should be seeking to nudge things....

"It is not possible to see very far in to the future and this section makes no claim to wisdom about the year 2000. But some current trends can safely be extrapolated for a decade or so....

Western Europe Expected to Become the Dominant Economic Power

"We live and seem likely to continue to live in a multipolar world, but the poles, or power centers, are not comparable, nor are the relationships between the major centers of power symmetrical. The pentagon is a misleading symbol. The two superpowers, the United States and the Soviet Union, are still dominant and are likely to continue to be so in the nuclear field, despite the probability of some increase in the nuclear capability of China and very likely in that of Western Europe, and some further nuclear proliferation (India, almost certainly; Japan, less certainly, but perhaps). Economic power is, however, distributed very differently from military power. The United States remains at the apex of the 'golden triangle' – itself, Western Europe, Japan. But Western Europe, as it consolidates, will become a much more equal weight in economic balance; and in certain aspects of economic power it will, when it can effectively organize itself, be the dominant power. In some regions of the world, local powers (e.g., India, Indonesia, Brazil) seem likely to become relatively more important than any, or all, of the five major powers.

Structure of Power Varies with Issue-Area

"Not only has the rigid simplicity of the bipolar world given way to a much more fluid and complicated pattern in which the structure of power varies with the issue-area or chessboard – to use Stanley Hoffmann's phrase – and with the region, but also the units or actors on the several chessboards are an increasingly heterogeneous lot. The main actors, the nation states, are far more numerous than they were when the basic thinking about postwar 'structure' was done in the late 1940s. And they are so dissimilar in size, population, wealth, stage of development, culture, form of organization, effective sovereignty, that there are fewer and fewer respects in which these entities can sensibly be regarded as like quantities in the system. The never very homogeneous category of states now

commonly referred to as the LDCs, or less developed countries, is becoming markedly more disparate. 'Less developed' no longer necessarily corresponds with 'poor' (Saudi Arabia and other major oil-producing countries being the most obvious examples of spectacularly rich LDCs) and other developing countries (mainly some of the Latin American countries) are now moving into a new intermediate category. Nor is there any longer an identifiable 'unaligned Third World,' if, indeed, there ever was one.

"Moreover, although for most purposes the nation states are likely to remain the prime actors, they are not the only significant actors. The most obvious and familiar examples are the multinational enterprises. Raymond Vernon has estimated that the branches and subsidiaries owned or managed by large enterprises outside their own countries may now involve \$200 billion, or more, of assets.

Regional and Global Organizations to Increase in Power at the Expense of the Nation-States

"We do not yet understand the implications of this development for the role of the nation state. Nor have we fully appreciated the way other transnational links, such as those among professional associations (airline pilots, monetary economists, or nuclear physicists), foster new allegiances and thus limit the choices of governments. A few intergovernmental organizations (e.g., the World Bank or IBRD) already play a role as quasi-independent actors. As discussed below, organizations at both the regional and global level seem likely to increase in power at the expense of the nation states. Today the European Community both enhances and erodes the power of its constituent member states. But as time goes on, more power can be expected to shift to the European level.

Government Intervention in Economic Life Not Apt to Diminish

"Although today one is struck by the force of nationalism almost everywhere, the nationalism in the developed countries has an overripe smell to it, suggesting that it is, in part at least, a reaction to the fact of greater interdependence, to the loss of effective autonomy in many fields, and to the increasing remoteness of the effective level of decision-making. Not only has nationalism – which at the end of the Second World War seemed on the wane in the more highly developed countries, caught a new grip on life, but there is also a new vociferousness to ethnic loyalties at the subnational level, e.g., Flemings, Bretons, Welsh. Government intervention in economic life is not apt to diminish. But as some functions are pushed to higher levels (European or global) when, as in monetary matters, the national span of control is not adequate, other functions may be pushed down to local levels to try to re-engage the individual in the decision-making process and to counter the trend toward apathy and opting out of the political process.

The Nation-State Seems Likely to Become a Somewhat Less Dominant Level of Decision-Making

"Thus, especially in the developed countries, the nation seems likely to become a somewhat less dominant level of decision-making, eroded from both above and below, and a somewhat less important focal point of loyalties – increasingly challenged by new transnational attachments of various kinds, particularly among specialist groups and elites, and by the apolitical globalism of a highly educated and mobile generation of young people....

Defining the Kind of International Order Under Development

"One way of defining the kind of international order we should be trying to bring about is by describing the conditions that should exist or the processes that should be in train. What should be happening, or not happening? Given the diversity of values between societies, is it, in fact, possible to list characteristics that both satisfy our own views and command a wide enough consensus to serve as useful guideposts?

Agreeing Upon Conditions Desired in an Acceptable World Order

"There are a few absolute conditions – things that must not be allowed to happen – that probably would be widely agreed upon. Thus there would be little disagreement on the following *conditions* of an acceptable order:

"No nuclear catastrophe

"No major war, defined as any nuclear war or any war involving direct conflict between two or more of the five major centers of power: the United States, the Soviet Union, China,

Japan, Western Europe

"No major ecological disaster

"No widespread economic breakdown

"No genocide

"No nuclear blackmail.

Processes Which Are Likely to Take Place

"In addition to these six conditions which an acceptable order should satisfy, it would probably be widely agreed that the following *processes* should be taking place:

"Abatement of the arms race; no, or little, nuclear proliferation; progress toward disarmament

"Substitution of peaceful processes of change for violent processes of change

"Substitution of peaceful settlement of disputes for violent settlement of disputes

"More efficient use of global resources, both human and material ('efficient,' as used here,

explicitly includes social and ecological as well as economic criteria)

"Improvement in economic welfare

"Improvement in quality of life

"Some narrowing of the disparities in wealth as between countries

"Some narrowing of the disparities in power as between states

"Protection and advancement of human rights, including the right to individual and collective

diversity and autonomy....

Difficulty in Achieving and Sustaining an International Order

"It will not be easy to achieve and sustain an international order characterized by these conditions and processes in the world we seem destined to live in for the next few decades, with its new interdependencies, cross-cutting relationships, wide variety of actors, and multiple and shifting loyalties. It will frequently be hard simply to see what is actually happening, how decisions are made, where real power resides, how decisions taken or not taken in one area of policy affect developments in other areas of policy. This complicated, messy world system will have some advantages. It will have a tough flexibility and be harder for any single power, or group of powers, to manipulate than would a simpler, more easily understood, more hierarchical system. But 'managing' interrelationships between states and other transnational actors will be immensely difficult.

Areas Requiring Some Form of International Management

"This essay look[s] at some of the problems of 'management' we face and at some of the relationships it seems to me to be desirable to encourage in four major areas: security, management of the international economy, development, and management and conservation of natural resources, including the environment, space, the oceans and the seabed. These are not the only areas requiring some form

of international management, but they seem to me to be the main ones. Institutional needs obviously cannot be considered apart from the existing pattern of overall relationships among states, or the pattern one wants to encourage, or the purposes one is seeking to achieve by promoting some processes and modifying or arresting others. Nor, as will become plain, can the process-relationships-institutions in any of these four broad areas be considered in isolation from their counterparts in the other areas...." ("The Management of Interdependence: A Preliminary View," pp. 7, 11-13, 14-16, 17, 19-20.)

The International Economy Requires Collective Management

Management of the international economy, according to Miriam Camps: "...calls for a great deal of highly sophisticated collective management reaching well down into the domestic area, for it is here that 'interdependence' has gone the furthest and is creating the most serious problems. The 'real' world of banking and industry has joined the economies of the highly industrialized countries; rules and organizations exist but governments have yet to adapt them or to create new instruments of supervision and control to match their objective interdependence." (*Ibid.*, pp. 90-91.)

Atlantic Council Undertakes Special Study on the Management of Interdependence

On June 19, 1974, the Board of Directors of the Atlantic Council of the United States, located in Washington, D.C., recommended that the Council also undertake a study on the Management of Interdependence. Shortly thereafter the Council published "Beyond Diplomacy," an Interim Report of the Council's Special Committee on Intergovernmental Organization and Reorganization. The Special Committee reported that it was their belief that "the development of effective means for the joint exercise of sovereignty by key nations with respect to common problems is a basic need of today's and tomorrow's world...." (*Policy Papers*, The Atlantic Council of the United States, Washington, D.C., no date, p. iii.)

Interdependence is an International Fact

The preface to the Interim Report states:

"As the United States completes its two-hundredth year of national independence, it is fitting to take stock of its international relations in today's interdependent world – a world vastly different from that of 1776. Interdependence, whether we like it or not, is the overriding international fact of the last half of the 20th Century. Effective management of that interdependence is increasingly crucial to the security and prosperity of our own people and, indeed, of all peoples.

Traditional Pattern of Diplomacy Obsolete

"The traditional pattern of diplomacy conducted solely on bilateral lines between sovereigns by Ambassadors and Foreign Offices is an obsolescent as the sailing vessel. In the 20th Century it is being progressively replaced by, or used to reinforce, multilateral efforts to harmonize governmental policy and action on major matters of common human or national concern.

"The government of a sovereign nation-state has the authority to legislate within its own frontiers but it has lost the ability to achieve many of its important national goals and the aspirations of its peoples solely by its own isolated efforts.

Need to Adapt the Nation-State to the Space Age

"It is more than a coincidence that the nation-state replaced feudalism shortly after the introduction of gunpowder into the West. The world is currently groping for means of adapting the nation-state to the requirements of the nuclear and space age on a crowded, urbanized and industrialized planet, shrunken in size by communication and transportation, and in ferment from the scientific, technological, communications and information explosions of recent years.

Exercise of Sovereignty Jointly with Other Nations

"Most of us were taught in our formative years that the nation-state was the highest form of political organization. 'National sovereignty' is a powerful political slogan and governments and peoples have difficulty in realizing that many of their goals can be achieved only through the exercise of sovereignty jointly with other nations." (*Ibid.*)

Improving Means of Intergovernmental Coordination

The Interim Report outlined the following areas in which new and improved means of "Intergovernmental Coordination" were needed: (1) security, (2) the International Monetary System and the IMF, (3) trade, (4) energy, (5) population, (6) food, (7) raw materials, (8) environment, (9) oceans and (10) outer space.

Common Decision-Making Among Nations

Chapter I of the Interim Report, entitled "Interdependence," states that joint exercise of sovereignty by similar nations is a must and calls for common decision-making among nations in a new world order. This chapter diagrams the strategy of interdependence as follows:

"The late 40s and the 50's produced an unprecedented wave of experiments in new forms of intergovernmental cooperation, primarily in Europe, Australia and New Zealand joining in. Yet science and technology, population, urbanization and

industrialization, communications, transportation, tourism, trade and investment, were moving faster than cooperative governmental efforts to deal with them. The web of interdependence was being woven at an accelerating pace. Private enterprise and individuals, especially the young, forged ahead in thinking and operating across national barriers. National governments understandably attached more importance to those barriers.

Central Tasks of Societies Transcend National Borders

"The world is on the move, and the pace is accelerating. It is moving into an era in which many of the tasks central to societies in search of greater realization of basic human values increasingly transcend national borders. It is becoming more and more evident that no government in this interdependent world can discharge many of its responsibilities to its peoples solely by its own efforts.

National Sovereignty – a Hollow Concern

"It is often suggested that we should not 'compromise' our sovereignty by undertaking commitments with foreign nations. Throughout history 'sovereign' nations have done so voluntarily through the treaty process. In today's world of high interdependence this is indeed a hollow concern. National sovereignty entails the power to legislate within the nation's borders and to enter into or withdraw from agreements with other nations. It does not and cannot by any means convey the power to achieve some major national and security objectives in splendid isolation. Today, attainment of our economic and security objectives depends closely on our links with other nations and with the world economy; there is a functional necessity for the joint exercise of sovereignty with other, like-minded, or similarly situated nations. International collaboration sometimes does restrict a nation's freedom of action in the short run. But by helping to obtain the nation's objectives, such as providing a high and rising standard of living or a population secure in its enjoyment of its values, it enlarges the country's freedom of action and hence its true independence.

Existing Intergovernmental Machinery Inadequate

"It is also clear that existing intergovernmental machinery is inadequate to enable national governments to pool their efforts to achieve for their peoples what they cannot do alone....

"Yet certain problems, notably in the fields of security and economics, unquestionably require coordinated policy and action through the joint exercise of sovereignty by national governments...;

"The World today and for a long time to come faces the pressing task of determining the scope, extent, nature and desirability of international

intergovernmental authority adequate to deal with the problems which transcend national frontiers....

"A failure to harmonize the exercise of sovereignties to meet the problems that are beyond purely national solutions is to permit the erosion and deterioration by disuse of the national prerogative of pooling national efforts to achieve common goals....

Collective Decision-Making Among Western Nations

"The increasing interdependence of the nations, economies and peoples of Western Europe, North America, Japan, and Australia is an important basis for world order. Their shared values, similar patterns of political and economic organization, and their conduct and common objectives are sufficiently compatible to warrant a high degree of consultation and collective or coordinated decision-making, whether in forums of a global nature such as the IMF or the World Bank, or on a more limited scale, such as the OECD and NATO. If collective action cannot be engendered between North America, Japan, Australia, and Western Europe, it is unlikely to develop on any effective global scale that harmonizes the interests of various groups and regions.

Overall Objective – an Open Community of Nations

"Yet the overall objective of this coordination should be an open community of nations dedicated to a systematic and orderly utilization of international political and economic policies for the common good.

Leadership of the U.S. Essential to Collective Management of Intergovernmental Arrangements

"It need not be argued that if this collective approach among the democratic industrialized nations does not receive the full participation and leadership of the United States it is not likely to be undertaken at all.

"This raises a different but related question from the one to which this Interim Report is mainly addressed. That underlying question is the willingness and capability of the United States government to participate effectively in the multilateral diplomacy that is essential to the collective or coordinated management of intergovernmental arrangements that involve many countries....

Constitutional Separation of Power Hinderance to Conduct of Foreign Policy

"There are three aspects of it to be considered:

"One is the development of practices and procedures that reduce the difficulties for the conduct of foreign policy that are inherent in our Constitutional separation

of powers between the Executive and Congress, particularly when that foreign policy involves an increasing degree of collaborative decision-making between sovereign nations on a multilateral level.

Meshing of National and International Decision-Making Process Needed

"A second is more effective meshing of the national and international decision-making process, including the development and improvement within the Executive Branch of an organization structure and procedures conducive to more effective participation in multinational organizations. This is essential in those increasing numbers of areas where action by one nation, or purely bilateral diplomacy, is inadequate and continuous multilateral decision-making is necessary if common national interests are to be ascertained, attained and preserved.

Need for New Intergovernmental Organizations and Procedures

"A third is improvement in the organizational structure and procedures of intergovernmental institutions to provide more effective service in advancing the common interests of the participating nations." (*Ibid.*, pp. 3-4, 7-8, 9-11.)

Convergence of the Trilateral Nations' Economies

Two comments that were added to the Atlantic Council Interim Report are of special significance. In the first comment Sir Eric Wyndham-White of Geneva, former Director General of the General Agreement on Tariffs and Trade, stated:

"In brutal fact there are three centers of economic and financial power whose decisions and policies are a determinant of the world's economic well-being. I refer clearly to North America, Europe and Japan. (I deliberately leave aside for the moment the recent and to my mind somewhat exaggerated accretion of wealth of the petroleum producers.) The forceful publications of the Trilateral Commission, as well as of other organizations draw the consequences of this state of affairs. In effect, if the USA, Europe, and Japan achieve convergence in their economic policies there will be little difficulty in devising new institutions or adapting existing ones where their combined power will be effective since nothing construction can be done without them. For example, what I have chosen to treat as a marginal problem – the petro-dollars-I am convinced that a firm triple alliance would rapidly find persuasive means to integrate these funds into the international financial system in a constructive fashion.

Need to Talk Less About National Sovereignty

"Energy, environment, technology, food and raw material resources and the use of the sea and the stratosphere will all produce new and knotty problems of international management. But again the first step is to recognize that these are problems which transcend national boundaries and national sovereignties. And let

us talk less about the latter. Every international agreement which amounts to anything involves some limitation of national sovereignty and interdependence will in the long run relegate this over-glamorized term to its relatively minor order of importance.

Ad Hoc Negotiations Should Be Limited to Those Concerned

"With regard to these problems, I tend to come down on the side of 'ad hockery' in the form of taking international action in the most appropriate international forum, but with the participation only of those who demonstrate and have a practical interest and the possibility of constructive contribution." (*Ibid.*, p. 83.)

Major Public Educational Effort to Convince the World of the Need to Converge Policies

Sir Eric Wyndham-White continues:

"All of this leads me to the key conclusion that what is important is the 'gap.' The gap is the recognition by governments and still more of intelligent people everywhere – and perhaps a major public information and educational effort would be the best result of the present exercise – that the basic problems of their nations, economies and societies depend upon the need for converging policies which are in fact imposed by an interdependent world. But somebody has to start the ball rolling.

Need for Continuous Consultation Among the Trilateral World

"Here, I return to the tripartite approach as a started. To be specific, the Big Three should initiate preparations for a summit meeting or rather a series of summit meetings which should review the whole gamut of world problems and pledge themselves to address themselves to these problems as matters of community interest and not of rivalry. The logical conclusion would be the initiation of a process of continuous consultation designed to ensure that their representatives in the existing form present a common front instead of seeking individual advantage, and using the indispensable machinery of multilateral diplomacy to attract blocs of supporters for differing points of view. I hasten to admit that this is an arbitrary, if sophisticated Congress of Vienna approach to which I see no alternative.

USSR May Eventually Join Trilateral Directorate

"Perhaps I would be kinder to my concept if I assimilated it more to the remarkable combined institutions through which the Allies pooled their resources to destroy the menace of Nazism. In due course, the USSR may see advantages in joining such a directorate. She should be encouraged to do so, provided that the conversion is seen to be sincere and not merely a Trojan horse to destroy the

system. There is one ultimate safeguard. A door opens inwards and outwards." (*Ibid.*, p. 84.)

Interdependence as a Central Fact of International Life

In the second additional comment Nathaniel Samuels, Chairman of the Louis Dreyfus Corporation and former Under-Secretary of State for Economic Affairs, stated:

"The international order that was created out of World War II was responsive to the immediate problems brought on by the War and to those traumatic experiences that preceded it in the 20s and 30s. Key problems, and their major institutional responses, were military security (NATO), reconstruction (OEEC – OECD, the World Bank), a liberal trade and a stable payments systems which would avoid deflation and unemployment (GATT and IMF), and a universal political framework consistent with 'one world' aspirations (UN). No one can doubt that interdependence as a central fact of international life has been growing since these organizations were created, as the Atlantic Council's Interim Report so brilliantly points out....

International Energy Agency Only a Forerunner of Other New Organizations

"There is good reason to think that international responses to the newer problems, such as resources supply and markets, oceans and outer space management, and arms proliferation will grow, not out of academic exercises, but out of the dynamics of differently perceived interests. The formation of OPEC by producing countries in the developing world has, for example, precipitated the formation of the International Energy Agency in the industrialized world, and this is probably only the forerunner of other new organizations which will arise out of the growing confrontation between the developing and the developed world about the nature of the economic order.

Floating Exchange Rates

"The post-World War II security and economic institutions will, of course, continue to adapt to new problems and circumstances. The security concept, as envisaged in NATO, obviously needs a realignment that continues to baffle us. The IMF, for example, provided the framework for a fixed rate exchange system, sanctified by the Bretton Woods Agreement, but now must adapt to a system in which exchange rates are not fixed but float. In fact, floating (including managed floating) is a means whereby national governments can 'protect' themselves against interdependence by better pursuing national objectives. And so it goes with other institutions.

Using Pragmatic Techniques in Dealing with International Problems

"There is a tendency at present to fragment rather than to consolidate organizational efforts to deal with certain international problems. We are tending at present to deal with energy problems, oceans policy, outer space, financial assistance facilities, inflation and recession, and perhaps before long non-oil commodity problems, as much in new forums as in existing ones. If we are to deal effectively with these complex tasks, we must be prepared to be pragmatic about techniques, using bilateral as well as multilateral approaches, regional as well as universal organizations and ad hoc forums as well as constituted organizations. It would be unwise to get ourselves hung up ideologically about international organizational procedures.

Harmonization of Decision-Making Process Among Top Political Leaders

"Perhaps the most needed element in the international system at present is engagement of the top political level of the industrialized countries in the harmonization and decision-making process. The stability we seek internationally rests, in the last analysis, on the ability and willingness of national states to harmonize their internal imperatives with international necessities. This will probably best be done by arrangements for harmonization of policies at the Ministerial political level largely on an ad hoc basis.

Likelihood of Mismanagement of Interdependence

"Interdependence is more likely to be mismanaged than managed if we do not leave sufficient room for flexible and ad hoc responses to problems with which we have only limited or no experience, and there is as much danger in being over-organized as in being under-organized.

Opposing Views on How the World Should Be Organized

"It is likely that the growing gulf in perceptions between the economically less developed and the more developed countries on how the world should be organized will overshadow international life and institutions during the years ahead. International institutions will reflect this division and the several subdivisions that are emerging in these two worlds. The existing institutions will undergo pressures to adapt their structures to new circumstances and changing power balances, and new institutions will be created, depending on the nature of the problems and how difficult it may be to shift the weight of power within the older institutions....

High Degree of Institutional Flexibility Needed

"Interdependence is a fact of life, but we would, it seems to me, be well advised to maintain a high degree of institutional flexibility in trying to manage it constructively." (*Ibid.*, pp. 85, 86-87.)

Meshing of National and International Decision-Making Processes

The concluding comments of the Interim Report sketch out the following blueprint for "governance" of the new world order or global community of nations which is slowly emerging:

"The closer the interrelationship between the national and international decision-making processes the better. This entails meshing at all stages and at all levels. It entails initiative in proposing intergovernmental discussion of problems or situations at early stages. It entails close relationships between international staffs and national delegations, and between the staffs and regular or *ad hoc* meetings of policy-making and enforcing officials from the respective capitals, from the highest levels down through the various levels of functional authority.

Extent to Which International Management Can Be Acceptable Deserves Examination

"The extent to which international 'management' can be acceptable to governments deserves examination. In corporate structure there are three levels: ownership (so diffuse as usually to be meaningless), control (by the Board of Directors) and management (individuals selected and advanced over the years for their competence in administration). In national political terms this corresponds to the public, the Legislative and the Executive Branches. In the experiment of the 'European' organizations the 'management' was to be vested in the Commission and the 'control' in the Council of Ministers. In practice the control largely stultified management, even with respect to its constitutionally authorized power of initiative. Yet certainly effective international organization requires fixing the power to initiate, plan and recommend in some one authority or institution." (*Ibid.*, pp. 78-79.)

Construction of World Order to First Begin in Non-Military Areas

According to Miriam Camps, the Atlantic Council and others, the emerging new world order is to be first constructed in non-military areas. This view is also shared by Kingman Brewster, Jr. Writing in *Foreign Affairs* in 1972 he stated:

"Although the prophets of world government expected their cathedral to be founded on the rock of superior collective military force, it is more likely that supra-national institutions with some of the attributes of governmental authority will first emerge in nonmilitary areas. Control and management of worldwide

satellite communications; prohibitions and requirements to diminish pollution; the regulation of international capital, commercial and financial transactions – all of these areas are already demanding a regimen which no single nation can provide on its own." (Vol. 50, no. 3, Apr. 1972, p. 410.)

House of World Order to Be Built from Bottom Up

Richard Gardner, former Ambassador to Italy, writing in an article entitled "The Hard Road to World Order," collaborates with Brewster and states that the "new world order" is being built from the bottom up.

"If instant world government, Charter review, and a greatly strengthened International Court do not provide the answers, what hope for progress is there? The answer will not satisfy those who seek simple solutions to complex problems, but it comes down essentially to this: The Hope for the foreseeable future lies, not in building up a few ambitious central institutions of universal membership and general jurisdiction as we envisaged at the end of the last war, but rather in the much more decentralized, disorderly and pragmatic process of inventing or adapting institutions of limited jurisdiction and selected membership to deal with specific problems on a case-by-case basis, as the necessity for cooperation is perceived by the relevant nations. Such institutions of limited jurisdiction will have a better chance of doing what must be done to make a 'rule of law' possible among nations – providing methods for changing the law and enforcing it as it changes and developing the perception of common interests that is the prerequisite for successful cooperation.

"In short, the 'house of world order' will have to be built from the bottom up rather than from the top down. It will look like a great 'booming, buzzing confusion,' to sue William James' famous description of reality, but an end run around national sovereignty, eroding it piece by piece, will accomplish much more than the old-fashioned frontal assault." (*Foreign Affairs*, vol. 52, no. 3, Apr. 1974, p. 558.)

An Extraordinary Opportunity to Achieve a Global Society

In a speech before a World Affairs Council Group, former Secretary of State Henry Kissinger stated:

"I believe that with all the dislocations we are now experiencing there exists an extraordinary opportunity to achieve for the first time in history a truly global society, carried by the principle of interdependence." (*International Educational Cultural Exchange*, vol. 3, no. 1, Summer 1976, p. 35.)

The Atlantic Institute for International Affairs

It is obvious, as is seen from the content of the above quoted material, that a "global society, carried by the principle of interdependence," is in the developmental stage. It is also apparent that many groups have been working for a "community of nations." One of the most influential international organizations involved in this effort is the Atlantic Institute for International Affairs located in Paris.

The Atlantic Institute and the Trilateral Commission Considered a Merger

At one time, the Atlantic Institute seriously considered a merger with the Trilateral Commission. Concerning this possible merger John M. Goshko, a *Washington Post* staff writer noted in 1978:

"The Trilateral Commission – the David Rockefeller-founded group many of whose members moved into influential positions in the Carter administration – is considering a merger with another heavy-weight, private organization of prominent international movers and shakers.

Atlantic Institute – Well Known in High Circles

"The commission's prospective merger partner is the Paris-based Atlantic Institute, an organization that isn't exactly a household name in the circles where most people move.

"But, in that special arena where global thinkers, multinational business executives and politicians rub against each other in an effort to influence world events, the move has potentially large significance. Its impact is roughly comparable to the effect in business circles of, say General Motors joining forces with Volkswagen....

"President Carter was a member. So, too, was Vice President Mondale; and Carter's national security advisor, Zbigniew Brzezinski, had been a director of the commission.

"Other Trilateralists in the administration include Secretary of State Cyrus R. Vance, Treasury Secretary W. Michael Blumenthal, Defense Secretary Harold Brown, U.N. Ambassador Andrew Young, Deputy Secretary of State Warren Christopher and Under Secretary of State Richard N. Cooper....

Merger is Not Certain

"What's more, [George] Franklin [Coordinator of the Trilateral Commission] stressed, a merger is by no means certain...

Trilateral Commission and the Atlantic Institute Both Remarkably Alike

"As he points out, both organizations are remarkably alike in many important respects. The Trilateral Commission, which was founded by David Rockefeller in 1973, has been described as a 'sophisticated establishment Rotary Club' and a 'floating seminar for business and academic and political leaders.'

"Its members are mainly establishment figures recruited from North America, Western Europe and Japan. Every nine months or so, they get together on one continent or another to tilt verbally at world problems; and the commission hires academic experts to turn out weighty studies on the subjects that interest the members.

Overlap of Membership

"The Atlantic Institute is, in many key aspects, an almost interchangeable organization. It is directed by Martin Hillenbrand, former U.S. ambassador to West Germany, and, as one Trilateral staffer notes, 'At any given time, there's probably an overlapping group of 10 to 20 individuals who hold membership in both.'

Main Difference Between the Two Groups

"However, the two groups are not identical. The Trilateral Commission tries to suggest policy options on a variety of topics, while the Atlantic Institute is geared more toward instituting and subsidizing research on economic problems.

"Despite a common supposition that the commission is subsidized by the Rockefeller family, both organizations actually obtain the bulk of their operating funds from tax-exempt foundations and corporate gifts. Inevitably, that means competition for the available money; and, as Franklin noted, that in turn, is a spur to merger." (*The Washington Post*, January 18, 1978.)

Purpose of the Atlantic Institute

The purpose of the Atlantic Institute is described as follows in one of its official documents:

"At a time when ever-greater areas of human activity have become subject to state control and financing, the role of the private and independent center of research, discussion and influence takes on increasing importance. The Atlantic Institute for International Affairs in Paris is such a center maintaining ties with similar organizations in many other countries. Originally conceived as sort of a public arm of NATO in 1961, it quickly grew beyond that into a center of general intellectual activity and of significant policy-oriented research on the problems which the advanced industrial societies of Europe, North America and the Pacific Basin share with one another.

Permitting and Encouraging the Free Exchange of Ideas

"One of the fundamental assumptions of the democratic societies, by and large identified with the countries associated with the OECD, is that the maintenance of those societies requires an intellectual climate permitting and encouraging the free exchange of ideas as well as the toleration of opposing points of view which are not destructive of the basic order within a pluralistic framework. At the same time, there must be continuing zealous search for systematic knowledge and truth using the tools of scientific analysis without fear of governmental controls. This is what distinguishes those societies from the totalitarian societies of Eastern Europe and elsewhere in the world.

A Truly International Institute

"As a truly international Institute drawing support from the OECD world, and with a Board of Governors representing most of the OECD countries, the Atlantic Institute for International Affairs is in many ways unique. Its objectives are to provide timely, reasoned analysis, to promote informed discussion and to make practical recommendations on the solution of problems common to the advanced industrial countries of the world in their relations among themselves, with developing countries and with the Communist countries.

An Ongoing Program of Policy-Oriented Research

"While primarily a research organization with a major ongoing program of policy-oriented research the Institute thus attempts as well to have practical input into policy discussions in accordance with its basic philosophy, in the following ways: (1) through publication and distribution of the results of major research projects, usually in the form of books, and through the publication of the *Atlantic Papers* series and occasional papers; (2) through its network of influential members of its Board of Governors, many of whom hold leading positions in the business or banking worlds or have, at one time or another, held high governmental office, or will hold high governmental office (the practice is to resign upon assuming an executive position in government; four former members of the Board joined the Carter Government; the present Prime Minister of Ireland was a member of the Board; as well as several other ministerial-level present members of governments). The Institute's communication network is further extended through the executives of the Participating Member firms who support the Institute and are brought into contact with its programs. Many of these maintain contact with the Institute on visits to Paris; (3) through the semi-annual meetings of the Board of Governors and the Participating Member firms which are designed to promote informed discussion on topics of current importance; (4) through the seminar program of the Institute, including a special program for the press, which has achieved considerable attention not only in the Paris area but also in other countries from which participants are brought. (The results of these meetings are

disseminated to members of the Board of Governors and, as appropriate, to Participating Member firms.); (5) through the activities of the Political and Economic Committees of the Atlantic Institute which maintain close relations with NATO, the European Community and the OECD. Situated in Paris the Institute as such is in a favorable position to maintain close contact almost on a day-to-day basis with the OECD, the Secretary General of which, Emile van Lennep, is an active member of the Institute's Board." ("Statement of Purpose," Atlantic Institute for International Affairs, Paris, no date, pp. 1-2.)

An Overview of the Movement Toward Global Governance

It is apparent that the movement toward the creation of a global system of governance is proceeding under the guidance of such influential institutions as the Atlantic Institute for International Affairs in Paris, the Trilateral Commission and Council on Foreign Relations in New York City and the Atlantic Council of the United States in Washington, D. C. The construction of this system has taken many decades. In the report, "Beyond Diplomacy." issued by the Atlantic Council of the United States, there is a section which outlines the history of the movement. It is entitled, "Lessons From Experience." It provides the reader with an excellent summary of the development of global decision-making and global institutions which transcend the nation-state and national sovereignty. The report stated:

The Shortcomings of the League of Nations

"The shortcomings of the League of Nations and of its successor, The United Nations, were clearly foreseen by General Jan Smuts in his famous memorandum of December 16, 1918 commenting on a draft of the League Covenant:

"The scheme which I have seen, and which brings representatives of all the independent states of the world together in one conference to discuss the most thorny of all subjects and requires that their decisions to be binding must be unanimous, is from that point of view not worth discussion. It means that there never will be any decision issuing from the league; that nobody will take the league seriously; that it will not even serve as camouflage; that it will soon be dead and buried, leaving the world worse than it found it.'

"That Smuts was not being merely cynical in his foresight is shown by the foreword to that memorandum, in which he stated:

"If the league is ever to be a success it will have to occupy a much greater position and perform many other functions besides those ordinarily assigned to it. Peace and war are resultants of many complex forces, and those forces will have to be gripped at an earlier stage of their growth if peace is to be effectively maintained.'

"And later:

"War is a symptom of deep-seated evils; it is a disease or growth out of social and political conditions. While these conditions remain unaltered, it is vain to expect any good from new institutions superimposed on those conditions.'

The Refusal of the U.S. Senate to Participate in the League of Nations

"The weaknesses which Smuts foresaw were compounded by one political development not the fault of the League or of its Covenant, the refusal of the Senate to permit U.S. participation, even safeguarded by the requirement for unanimity. Considering the generally isolationist nature of American public opinion during the 1920's, it is not at all certain that U.S. membership would have made a great difference.

The Development of New and Useful Functions

"Even without U.S. membership the League did develop certain new and useful functions. Its Finance Committee helped to restore order in a number of European countries; its Labor Committee plowed new ground in setting patterns for human rights; its staff launched new economic investigations and its forum became a platform in the struggle for peaceful settlement. Individual Americans served effectively in all these functions. But the vacant official chair and their lack of authority doomed it to failure in its major responsibilities.

The Dream of a New World Order

"It was only in the functional field that part of the 1919 dream of a new world order survived. The International Labor Organization, established in association with the League of the Treaty of Versailles, combined representatives of governments, workers and employees in the drafting of conventions designed to raise labor standards. No member is obligated to ratify these conventions but each is obligated to submit them to its own constitutionally competent authorities for consideration within a year of their adoption. The U.S. became a member in 1938 while still treating the League at arm's length. The ILO survived the League's demise and became a specialized agency of the U.N.

Central Bankers Gather Each Month at the Bank for International Settlements

"As the League withered and disintegrated, no other significant experiments in intergovernmental coordination were attempted in the inter-war years other than the establishment of the Bank for International Settlements in 1930, for the specific purpose of aiding the settlement of German reparations. The BIS profited from being a small group of key Western European Finance Ministers and Central Bankers, homogeneous and powerful and informal in its operations. It was said, as much in truth as in jest, that the greatest value of the BIS was getting the central bankers of Europe together for lunch once a month. Actually it was normally for a

long weekend. The informality of these meetings, and contacts between meetings, made possible a free exchange of ideas and often led to cooperation as to policies and programs. The Bank survived World War II and is still functioning. In fact, in April 1975 when the agreement establishing the OECD Financial Support Fund (the '\$25 billion safety net') the Bank was selected by the Fund as its agent for administrative purposes and to arrange market borrowings.

An Unprecedented Pooling of Decision Making Authority

"The challenge of World War II was recognized by the peoples of all the allied countries, including Americans after Pearl Harbor, as new in magnitude and in peril – "total war." It produced unprecedented pooling of decision-making authority. The process was facilitated by the fact that the European allies were represented by governments-in-exile and the British. Dominions were closely constitutionally linked to the United Kingdom and generally acquiesced in decisions which the latter reached jointly with the U.S. In effect there were only two in the cockpit, flying in the face of mortal danger. They had to succeed and they evolved the means of managing the effort necessary to do so.

Effective Central Decision-Making Authority

"There was effective central decision-making authority. Roosevelt and Churchill provided the supreme leadership. They met fairly frequently and were in constant contact by cable. It was not government by committee, it was a partnership of two Heads of Government, assisted by a number of Combined Boards with integrated staffs.

"Under the supreme direction of the two Heads of Government, the integrated allied conduct of World War II in both the military and civilian fields was handled on a functional basis. The Combined Chiefs of Staff gave overall direction for the military conduct of the war with an integrated staff in Washington and integrated commands and staffs in the field.

The Combined Boards Run World War II

"The non-military, or production and supply, side of the war was handled by the various Combined Boards. Their names, functions, and organizations were changed as the war progressed but the principal ones at the end were the Combined Raw Materials Board, the Combined Resources and Production Board, the Combined Food Board, the Combined Munitions Assignment Board and the Combined Shipping Board. Each had numerous subordinate committees and working groups in addition to its integrated staff.

"All of the Boards had concrete and urgent functional tasks to perform. Often they were competing with each other for resources, productive capacity, finished products and transportation. Arguments were functional rather than national;

regardless of nationality, it was generals against admirals, the military versus 'essential civilian supply,' the food people against the munitions people, and so on. Difficulties were rarely due to nationalist pressures; they were due to (1) inadequate integration of the Combine boards with the national agencies concerned, and (2) inadequate coordination between the work of the various Boards. Most problems were resolved at the working level, others were refined for higher level decision. Decisions were made and revised jointly and carried out by national authorities.

Membership of the Various Boards

"While the membership of the top Boards was limited to the U.S. and the U.K., membership in the subordinate bodies included representatives of other governments in accordance with their potential contributions to the war effort; i.e. Canada, Norway and the Netherlands were represented in various committees of the Shipping Board and all of the Dominions in those of the Food Board. Everyone was represented in some way, either as producers or, in most cases, as claimants, in the complex of the Munitions Assignment Board.

"Despite occasional complaints from American officials that resources were being pooled on a 'one rabbit-one horse' basis, and more serious ones by Allied officials that their governments were inadequately consulted concerning matters of major concern to them, the system worked.

Vast Change in Public Psychology

"Back of this effective organizational structure was the vast change in public psychology. World War I for the United States had lasted only a year and a half. Only a small percentage of American soldiers and sailors were actively engaged in combat. World War II was longer, bloodier, more devastating everywhere. The lesson of the meaning of War and Peace had enormous impact on the peoples of all the principal belligerents.

"It was this psychology which was carried over into the struggle for recovery and the struggle to give new meaning to international relations, new impetus to the effort to establish governmental machinery which could be useful tools to ensure 'Peace and Prosperity.'

"Several lessons can be drawn from this wartime experience.

"One is obviously that grave danger strips away a lot of inhibitions, nationalistic and otherwise, in the face of imperative need to get results.

"Another is equally obvious – that the smaller the number of nations participating in the final decision-making process the easier it is. This has the less obvious corollary that all others directly affected should have full opportunity to

expound their own positions, and have confidence that reasonable account is taken of their particular interests.

"Third, a large area of well-perceived common interest is an essential foundation for effective joint action.

"A fourth is that competent staffs of two or several nationalities dealing with a functional problem can and often do develop a functional rather than a national approach.

"A fifth is the need for close meshing between the operations of the intergovernmental agency and the relevant national ones.

"A sixth is the need for some effective authority to coordinate the work of the functional agencies.

"A seventh is the need to stimulate and mobilize the full force of private initiative and effort.

The Development of the United Nations

"The holocaust of World War II, culminating in the cataclysmic birth of the nuclear age, started a groping for new means of dealing in peacetime with problems which respect no national frontiers. Some lessons were learned from the weaknesses of the League of Nations.

"The drafters of the United Nations Charter were fully aware of the pitfalls of the requirement for unanimity. They were nevertheless made painfully aware that unless at least the U.S.S.R. and the U.S. were protected by it, neither would be a member and in effect there would be no U.N. So the veto power was retained in the Security Council for those two and for Britain, France and China, against the better judgment of practically all delegations.

The U.N. Achieves Universality

"The League had failed to achieve universality. The U.N. achieved it – to an extent far greater than anyone imagined or would have desired. The original membership of 52 nations has now passed 130. The basic principle of one nation one vote, meaning that the status of Mauritius in the organization is equal to that of the U.S. except in the Security Council, stretches the difference between theory and fact to near the breaking point.

"Some years ago, when the membership of the U.N. was considerably smaller and somewhat less heterogeneous than it is today, the U.S. and other advanced democratic nations sought to avoid the incubus of the veto by increasing the powers of the General Assembly through the 'Uniting for Peace' resolution.

Without wholly escaping the Scylla of the veto they slipped into the Charybdis of increasingly irresponsible decision-making by simple majorities on a one-nation-one vote basis that seriously weakens the organization as an instrument of intergovernmental cooperation.

"The increasingly heterogeneous membership, with many members short of trained manpower and the natural demand of all for some representation for their nations on the Secretariat, has naturally created major staffing problems.

The U.N. Has Served Several Important Purposes

"Yet the U.N. experience has served several important purposes. It has provided a forum for blowing off steam and for diplomatic contacts, more profitably informal and outside rather than in formal meetings, between responsible leaders of many countries.

"A strong Secretary General, Dag Hammarskjold, had the confidence even of opposing factions and the initiative to stretch the authority conferred by resolutions of the Security Council or the Assembly to the limit. Accordingly he could accomplish a good deal by his own personal leadership.

Creation of Peacekeeping Forces

"The U.N. has been successful in its efforts to secure agreement upon the creation of peacekeeping forces, and raised and maintained them with very considerable effect in a number of very difficult situations.

"Even more importantly, it has sought to come to grips with some of those 'complex forces,' 'deep seated evils,' and 'social and political conditions' which Snuts had in mind. The Economic and Social Council and the regional Economic Commissions for Europe, Latin America and the Far East have undertaken, albeit with limited success to deal with some of them.

Development of Specialized Agencies

"It is the 'specialized agencies' of the U.N. in various functional fields which have made the most progress toward at least ameliorating those 'deep seated evils' and improving the human condition. In addition to the ILO, the best known ones are the International Bank for Reconstruction and Development, the International Monetary Fund, the Food and Agriculture Organization, UNESCO and the World Health Organization.

Development of the IMF and World Bank

"While each of these 'specialized agencies' has made important contributions in its own field, the outstanding success stories are those of the International Bank for

Reconstruction and Development and the International Monetary Fund. Although possessed of a large and heterogeneous membership, now totalling 126, they have not had to deal with the thorny problems which U.S.S.R. membership would have caused. While the highest authority of the Bank and Fund is vested in the Board of Governors, consisting of the Finance Ministers of each Member, wide operational authority has been delegated by them to the Executive Directors, a board of 20 persons, many of the members of which cast the votes not only of their own government but of various other countries.

"They have also had the advantage of clear-cut operating responsibilities; in the case of the IBRD, economic and social development, and the case of the IMF, money and credit, foreign exchange, and payments imbalances. While the national interests and economic situations of the members vary widely there is at least a strong common interest in economic development, national solvency, credit worthiness and monetary stability, and a viable international monetary system that is conducive to the growth of trade and the generation and movement of capital across national borders.

Voting Power and Capital Subscription of the IMF and World Bank

"In both the Fund and the Bank, voting power and capital subscriptions or quotas are roughly proportionate to the relative economic size of the member states. The percentage distributions are approximately equal in the two institutions. Taking the IMF as the example, quotas and voting power range from SDR 6.7 billion and 21.24 percent for the U.S. down to SDR 5 million and 0.11 percent for Botswana and Lesotho. The nine Common Market countries have aggregate quotas of SDR 8.7 billion and voting power of 28.71 percent. Voting power is important in that certain major decisions (amendment of the Articles, increase in the size of the Executive Board and changes in quotas) require four-fifths of the voting power. Other important matters require 85 percent. Hence the U.S. has attached importance to holding its voting power above 20 percent. This will be one of the complications in the forthcoming quota review which is expected to increase the percentage share of quota of the OPEC Group from 5 percent to 10 percent, without decreasing the aggregate quota shares of the less developed countries. That will obviously be a difficult exercise.

The IMF and World Bank Control Very Large Financial Resources

"Undoubtedly a central characteristic of the IMF and the IBRD, which has been a key element in their effectiveness, is their possession and control of very large financial resources. This has enabled them to pay their own way, and to be financially independent of governments and annual appropriations. It has also made them basically operational; not only has it provided a high degree of independence of thought and action but it has also enabled them to develop an

especially competent career service, which has suffered much less than the U.N. from pressures for national allocation of secretariat positions.

The Principle of Concurrent Majorities

"Application of the principle of *concurrent*, as distinct from *simple*, majorities for fundamental decisions has had the effect of making the participating nations increasingly willing to lodge added authority and responsibility in these institutions.

The Executive Directors

"The Executive Directors comprise a group all of whom are in 'continuous session' at the Fund and the Bank. Effectively briefed by a competent staff and with a Chairman who is also the Managing Director or President, the Executive Directors have demonstrated an impressive capacity to make decisions.

"The work of the Executive Directors has been effectively supplemented from time to time by meetings of senior officials (the Group of 10, the Committee of 20, the Interim Committee) at both Ministerial and Under Secretary level, responsible for formulating national policies and for executing them. Such meetings have proved highly successful in promoting agreement at the top level of Governments.

An Annual Review of the Economies of Each Nation-State

"In recent years an 'annual review' procedure in the IMF has come to involve searching scrutiny of each member government's reserve position, balance of payments, rate of inflation or deflation and the general state of its economy.

Development of Wider Powers of Initiative and Executive Action

"Increasing governmental confidence in the staff and the top officers in both the Fund and Bank has led to the development of progressively wider powers of initiative and executive action for them. One effective activity has been technical assistance, particularly in helping less developed nations to formulate realistic development programs, financial stabilization programs, development banks, central banks, more effective fiscal systems, and better statistical services.

The IMF and IBRD Exercise Major Influence in Formulation of Monetary and Fiscal Policies

"The IBRD and the IMF have come to have major influence in the formulation of monetary and fiscal policies and exchange rates, as well as economic development programs, all of which were formerly exclusively the concern of national governments. They have done so by persuasion and building confidence,

rather than relying on legal powers or sanctions other than those of credit ratings and authority to give or withhold loans. But these are strong powers in practice.

Achieving Union in Europe

"During the War, the governments-in-exile of the Netherlands, Belgium and Luxembourg reached agreement that after the liberation of their countries they would form a customs and currency union. Belgium and Luxembourg succeeded in doing so but differences between the Netherlands and Belgium-Luxembourg in various fields of economic and social policy have prevented realization of a full customs and currency union. However, their pioneering efforts in that direction helped to inspire the effort to achieve union in the wider European Community. This experience clearly demonstrates the difficulty of achieving full monetary unity even between three governments of contiguous countries with a high degree of common interest.

The Organization for European Economic Cooperation and Closer Economic Cooperation at the Global Level

"In 1948 Western Europe was prostrate economically and facing acute hunger, suffering and social and political turmoil. Massive external aid was essential, with the U.S. as the main available source. Yet it was clear that American aid would be wasted if the recipients resorted to pre-war competitive beggar-thy-neighbor tactics of tariffs, quotas and other trade and payment restrictions against each other. Secretary Marshall made it plain in his Harvard speech of 1947, as did Congress in the Economic Cooperation Act of 1948, that progressively closer economic cooperation was the essential requisite for American aid. The British and French Foreign Ministers, Ernest Bevin and Georges Bidault, accepted the challenge and undertook to organize the efforts of the European allies to meet it. The Soviet Union, which was not intended to be excluded, opted out for itself and its satellites and thereby lost the opportunity for both national gain and international mischief making.

"Bevin recognized the need for both unity and security on a larger than European basis in December 1947 in his call for:

"...some form of union, formal or informal in character, in Western Europe, backed by the U.S. and the Dominions, such a mobilization of moral and material force as will inspire confidence and energy within and respect elsewhere.'

Allocating American Assistance

"The Organization for European Economic Cooperation undertook, with American participation, the interrelated tasks of allocating American assistance and of facilitating the interchange of capital and goods among the recipient countries. In the process, a habit developed which Jean Monnet described as:

"Instead of arguing with each other across the table, we all sat on the same side with problems on the other.'

"An effective relationship was developed between an integrated international staff and the various national delegations. The latter frequently found that recommendations agreed upon in the OEEC gave them effective assistance in getting legislative approval for constructive but politically difficult measures. The underlying U.S. financial and political pressure was a powerful, even compelling, stimulus toward agreement.

Each Nation Required to Report on Policies and Justify Them before Delegations of Nations

"The OEEC early developed a procedure by which the government of each member nation was required periodically to report on its relevant policies and to justify them under the scrutiny of the delegations of the other members. The process, which became known as the 'annual review,' proved valuable and has been adopted, in varying forms, by NATO, the IMF and the OECD.

NATO

"In 1947 and 1948 the apparent weakness of the U.N., the Soviet military occupation of Europe East of the Elbe, the coup in Czechoslovakia, the threat to Norway, and internal Communist influence in France and Italy, continued to make the fear of Soviet domination very real in the West.

The OEEC Begins the Task of Building a European Economic Union

"While the OEEC was beginning the task of building 'some form of union, formal or informal in character, in Western Europe, backed by the United States...', the North Atlantic Treaty was concluded to provide 'such a mobilization of moral and material force as will inspire confidence and energy within and respect elsewhere.'

"The Treaty was based on the necessity of deterring aggression. This entailed the corollary necessity of making clear that the Alliance had the ability, and the will, to defend its members promptly and successfully should aggression nevertheless occur. It was reasoned that both World Wars might have been avoided had the German Governments of 1914 and 1939 realized that the full industrial and economic strength and military potential of the U.S. would eventually be thrown against them.

Collective Defense Generated by Soviet Power

"The rapid build-up of collective defense capability in the early and mid-50's came from a shared 'impulse of fear' generated by Soviet power and conduct during that period.

"The Treaty and the Organization established under it have succeeded in deterring aggression for over a quarter of a century and even de Gaulle, who strongly objected to integration of forces under the Treaty Organization, placed high value on the existence of the Treaty for this reason.

Integrated Command Structure at NATO

"On the military side, NATO has established several integrated commands, of which the two most important are the Supreme Allied Commands, Europe and Atlantic. Except for air defense forces, command and control elements, and certain 'standing naval forces' in the Atlantic and Channel areas, NATO does not have forces under its operational control in peacetime. The peacetime responsibilities of the Commands under programs agreed by the NATO Council are primarily those of planning, higher training and force readiness, with administration, unit training, discipline and logistic support under national control.

The Annual Review Process

"The Council and the Supreme Commanders are dependent almost entirely upon their powers of persuasion in an unending struggle with national political pressures directed toward less expensive and less onerous defense. This is assisted by the 'annual review' procedure, which in NATO has two phases. Each year a 'Defense Planning Questionnaire' is sent the member governments requesting detailed information on the forces each will earmark for NATO for the next calendar year. The replies of the respective governments are considered binding commitments. Every other year this is supplemented by a review and consideration of the plans of each for defense expenditures during the next four years and its force goals for the next six years. The replies are naturally not binding due to the need for parliamentary approval and the likelihood of changing circumstances. These reviews are helpful, however, and take a broad approach, covering economic and political situations in each country insofar as security is concerned.

The Council is in Continuous Session

"The Council is in continuous session at the level of the Permanent Representatives and periodically, usually twice a year, at the level of Foreign and Defense Ministers. It met at the level of Heads of Government on June 26, 1974, to sign the 'Declaration on Atlantic Relations' which had been adopted at the Ministerial level earlier in the month. In December 1957 a Ministerial meeting was attended by the Heads of Government of all NATO countries, and in December

1959 a more limited meeting was held by Heads of Government of France, Germany, Great Britain and the United States.

Team Spirit at NATO

"A useful contribution has been made by the NATO Defense College in giving field grade officers and equivalent civilian officials a common view of NATO problems and a degree of 'team spirit,' similar to that developed by the staffs of integrated headquarters, and which endures and spreads as the individuals involved progress to greater responsibilities.

Establishment of the Nuclear Planning Group

"Nuclear weapons have presented the Alliance with particularly difficult questions. How many fingers should there be on the trigger? How many on the safety catch? Whose? Much of the heat generated by these questions some years ago has been cooled by establishment of the restricted Nuclear Planning Group in which representatives of a number of governments have studied the problems of nuclear planning and have participated in policy development, targeting and consideration of contingencies.

A Substantial Habit of Consultation

"Politically, the NATO Council at both Permanent and Ministerial levels has built up a substantial 'habit of consultation,' with varying results. It has worked well with respect to Berlin, SALT and the negotiations on European security, badly on Suez, the Middle East and a number of other problems outside the Treaty area.

"It has worked badly when the commitment of member governments to achieve common solutions has been weak, or when some key government, frequently the U.S., has for reasons of secrecy or urgency, consulted only at the last moment and, more exactly, 'informed' its allies of decisions already taken rather than 'consulted' them. It has worked well when the key governments, again notably the U.S., have started the consultative process in the early stages of a situation, before its own policy had crystallized, and been frank in its presentations and receptive to the views of others.

Development of the North Atlantic Assembly

"The need for closer understanding between the Executive and Legislative Branches of the member countries, and between the members of the respective legislatures, concerning NATO matters led to the establishment in 1955 of the NATO Parliamentary Conference, known since 1966 as the North Atlantic Assembly. It is purely advisory in nature and its advice is more often ignored than accepted. Nevertheless, it has succeeded in giving a large number of parliamentarians in NATO countries a considerably better understanding of NATO

problems. It has a small Secretariat and standing Political, Military, Economic, Scientific and Cultural Committees, which are gradually doing more effective work between the Assembly's annual sessions.

U.S. Participation in the North Atlantic Assembly

"The U.S. is the only nation which participates by an act of its legislature; participation by the others is 'unofficial' and not necessarily representative. American participation is hampered by distance and the inability or unwillingness of many Senators and Congressmen to devote adequate time to it. Efforts over the years to increase the Assembly's competence by linking it to the OECD as well as with NATO have foundered over the unwillingness of the neutral members of the OECD to be involved in any way with NATO.

Refusal to Grant North Atlantic Assembly More Than Advisory Powers

"The principal lesson is of the chicken and egg variety. The respective parliaments (and governments) are unwilling at this stage to grant an interparliamentary body more than purely advisory powers. Unless it has more substantial powers, parliamentarians find their regular work at home far more important. Yet the Assembly continues to develop greater parliamentary understanding of NATO problems and therefore better national legislation affecting NATO.

A Grand Design for Integrating the Coal and Steel Industries of Europe

"In 1950 Jean Monnet and Robert Schuman conceived a 'grand design' of totally integrating the coal and steel industries of France, Germany, Belgium, Luxembourg and the Netherlands as a basis for 'supranational' unity. Institutionally, the European Coal and Steel Community was to be headed by a High Authority, whose members, while appointed by governments, would be 'supranational' rather than representatives of the participating governments. There was also to be a Council of Ministers, a parliamentary assembly and a Court of justice. A similar institutional pattern was followed with respect to Euratom and the European Economic Community – all three now combined in the 'European Community' – although the Commissions, which replaced the High Authority in these two, had much less direct power.

Specific Steps Toward Supranational Unity

"The founding Treaties contained no provisions for withdrawal and a series of deadlines were set for specific steps toward more supranational unity, including the progressive abandonment of the requirement for unanimity.

Underestimation of the Difficulties of Coordinating National Policies

"Unfortunately, the drafters of those treaties and those responsible for carrying them out underestimated both the inherent difficulties of the task of coordinating national policies in a wide range of fields and the strength of political and bureaucratic nationalism in the member countries.. Deadline after deadline was bypassed. Unanimity is still required for most decisions. The powers of the Commission have been steadily chipped away by the Council – a Committee of national Ministers. The Commission itself has become more preoccupied with detail and the mechanics of keeping the machinery moving than with innovation.

The European Experiment Has Fallen Short of the Original Grand Design

"Yet despite the extent to which the 'European' experiment has fallen short of the original grand design it has much to its credit. It has achieved a customs union within a common external tariff. It has made progress in harmonizing agricultural and other economic policies to varying extents. It has provided pioneering experience in dealing with the organizational and political problems of building any kind of 'supranational' structure. And one achievement which has attracted little public notice is that of the Court of Justice, whose rulings not only upon governments but also directly upon corporations and individuals have been accepted without question.

The European Free Trade Association

"On the breakdown in 1959 of negotiations for a free trade area to include all of Western Europe, Great Britain took the lead in establishing the EFTA or 'Outer Seven,' a free trade agreement covering Britain, Austria, Denmark, Norway, Sweden, Switzerland and Portugal, as a counterpart to the 'Inner Six' of the European Economic Community. Unlike the latter, EFTA was to have no supranational features and no common external tariff, merely internal free trade in non-agricultural products. It set a target date of 1970 to achieve that objective and in fact achieved it three years ahead of schedule.

"While EFTA also succeeded in eliminating a number of internal non-tariff barriers and a very substantial increase in internal trade its members ran a consistently high deficit in trade with the EEC countries and the pull of the latter was strong. It has faded in importance with British and Danish membership in the EEC, and conclusion of agreements of association with the latter by other members.

"The effort in 1948 to establish an International Trade Organization as a Specialized Agency of the U.N. parallel to the IMF failed to come into being because of the refusal of the U.S. Congress to enact the legislation necessary for U.S. participation. But the United States and 22 other governments which had launched the ITO did conclude a 'General Agreement on Tariffs and Trade,' which

the United States was able to agree to under the authority of the Reciprocal Trade Agreements legislation enacted in 1945. The GATT exists to this day as a trade agreement under a 'Protocol of Provisional Application,' although it has developed much of the apparatus and most of the characteristics of an organization.

A Forum for Multilateral Negotiations

"GATT embodies a set of trade rules less extensive and detailed than those proposed for the ITO. Over the years it has provided a forum and international staff for six successive rounds of multilateral negotiations directed toward freeing trade from the restraints of tariff and other barriers and is now embarking on the seventh.

GATT Has Developed a Substantial Body of Interpretive Law

"Its membership includes a large number of developing countries on the basis of special arrangements which relieve them of most of the obligations which bind the developed nations. It has even found a place, also under special arrangements, for four state trading nations: Yugoslavia, Poland, Rumania and Hungary.

GATT Develops Close Working Relationships with the IMF, UNCTAD and OECD

"Despite its anomalous status, GATT has been treated by the U.N. as if it were a Specialized Agency and has developed working relationships with the IMF, UNCTAD and OECD.

"Against these achievements must be balanced a number of weaknesses.

"There has been a gradual weakening of the enforcement mechanism for international trade rules and a lessening degree of compliance.

"Many of the trade rules need to be brought up to date to take account of changed circumstances and new problems.

"The GATT has been unable to deal effectively with agricultural trade. It contains no provision for assuring access to resources, and needs to intensify action against non-tariff trade barriers as well as tariffs among the industrialized nations.

"The GATT, with a large and heterogeneous membership, operates on a one-nation-one vote basis. Even though simple or two-thirds majority votes are provided for, it has proved increasingly difficult to use the GATT machinery to secure effective decisions as GATT's membership has grown.

"The developed countries, despite the frequent pressures of strongly divergent special interest groups within their societies, have had an underlying common concern for having the international trade system work. Most of the developing

countries, now in a large majority in members but not in volume of trade, seek the benefits of the system but do not accept significant responsibility for its functioning.

"Except for a Director General with no specified powers, the GATT has never had any executive authority such as an Executive Committee or Governing Board of restricted size. The Secretariat has proposed establishment of a 'Management Committee' of representative character but limited size, but no agreement on it has yet been reached.

Global Lessons from the GATT Experience

"Among the lessons available from the GATT experience are these:

– The 80 or so GATT countries, which range from the smallest and very least developed to the largest and most highly industrialized, will not and cannot be expected to adhere to common trade rules except rules of the most general kind.

– Only those countries which adhere to common trade obligations should have the power to enforce those rules among themselves, for example through specific codes of conduct, provided that the principle of non-discrimination is observed toward other GATT countries.

The OECD and Coordination of Economic Policy

"By 1960 it had become apparent that the European framework was too limited a one for the coordination of economic policy and that more attention should be given to the needs of the developing nations. The Organization for European Economic Cooperation was accordingly reorganized into the Organization for Economic Cooperation and Development, with the U.S. and Canada as full members and with the same privileges and responsibilities as its European members. Japan, Australia and New Zealand have subsequently become members. Discussions designed to coordinate, increase and improve the quality of assistance by the industrial countries to the developing ones are carried on in the Development Assistance Committee.

An Attempt to Escape the Unanimity Rule

"The Treaty establishing the OECD sought to escape the unanimity rule. It provided that decisions and recommendations must be taken by mutual agreement of all the members but that 'if a Member abstains from voting on a decision or recommendation such abstention shall not invalidate the decision or recommendation, which shall be applicable to the other Members but not to the abstaining Member.' The Intent was, however, largely nullified because the U.S. State Department, in order to obtain Senate approval of the Treaty, felt compelled

to give assurance that the U.S. would always insist on unanimity insofar as its own interests were concerned.

"The inheritance of much of the work of the OEEC and the breadth of the OECD's new mandate has resulted in over forty separate committees and working groups, and a staff of over 1,500. It is criticized for trying to cover too many disparate subjects and not doing as much as it should to concentrate on priority questions and to integrate the related aspects of key problems. There is undoubtedly room for more concentration of effort, but the price of sloughing off some of the peripheral work might well be the establishment of new functional agencies, and thus little real saving in staff expenditures would result.

The OECD's Impact on Government Policy Comes from Confidential and Unpublicized Discussions of Ministers Responsible for Economic Policy

"The OECD has been largely successful in compiling and analyzing information. Its economic analyses in particular enjoy a high reputation, and its statistical and other publications are very widely used. Its impact on government policy is hard to measure for much of its influence comes not from the formal adoption of rules and recommendations but from confidential and unpublicized discussions among the ministers and officials responsible for economic policy.

"One aspect of this is the 'annual review' procedure which entails detailed consideration of each government's presentation of its country's economic trends and outlook, including costs and prices, terms of trade, flow of capital and other relevant elements.

Regular Meetings of the Economic Policy Committee

"Two factors have been significant in determining the degree of success achieved. One is the personal competence and calibre of the senior officials of the Secretariat and of the key national participants, both Ministerial and Permanent Representatives. The other is the regular and *ad hoc* participation, as in Working Party 3 and the Economic Policy Committee, of senior national representatives responsible in their own capitals for determining and carrying out policy.

Development of the Communications Satellite Corporation

"U.S. Pioneering in the field of international communications by satellite led to the establishment in 1963 by Act of Congress of the Communications, Satellite Corporation (COMSAT) to provide modern communications between the U.S. and such other countries as wished to have similar services. COMSAT was given a unique form of organization – a publicly owned corporation with its Board of Directors nominated one-third by the Government, one-third by its shareholders (the public) and one-third by its customers (the commercial communications companies). All its stock is now publicly held. It provided for U.S. management of

the 'space segment' of the system, which consists of the satellites and the terrestrial working, control and monitoring facilities. The ground transmitting and receiving stations comprising the 'earth segment' of the system are owned by the respective governments or private commercial organizations and paid for by them.

An International Organization Necessary in the Long Run

"It was obvious that an international organization would be necessary in the long run and the International Telecommunications Satellite Organization (INTELSAT) was established as a temporary consortium in 1964 and as a permanent organization in 1973. At the end of 1974 it had 89 telecommunications organizations, representing their respective governments, as members. Weighted voting is based, differently from that of the Bank and Fund, upon the percentages of *use* of the system. COMSAT represents the U.S. and will continue as the Management Services Contractor of the Organization at least until February 11, 1979, when its present contract expires and the position is to be opened to competitive bidding.

"Traffic has grown at the rate of some 20 percent a year and voting power is recalculated quarterly. The U.S. share has declined from an original 80 percent to approximately 38 percent at present.

The Need for a Mixture of Private Ownership and Intergovernmental Organization

"The experience has shown that a mixture of private enterprise and ownership with intergovernmental organization is practicable in a field of advanced technology, at least in the early stages of its development. A complicating factor is that the Federal Communications Commission has, under the communications Satellite Act of 1962, regulatory jurisdiction of some of COMSAT's functions, including rate making.

The International Energy Agency

"As the International Energy Agency was created only in November 1974 and is still only in 'provisional' existence, it would be premature to try to draw lessons from its experience other than those evident in the agreement for its establishment.

"First, the agreement expresses the conviction that the objectives of the members with respect to energy can be achieved only 'through continuing cooperative efforts within effective organs' to be created within the framework of the OECD.' The 'effective organs' are to be a Governing Board, a Management Committee, four substantive Standing Groups and a Secretariat.

"Second, it provides a scale of weighted voting power and specific decisions to be taken by unanimity (particularly those relating to the imposition of new obligations and certain others which require specified majorities.

Global Lessons Learned from International Cooperation and Coordination

"In summary, what lessons can we derive from experiments in international cooperation and coordination since World War I?

"Neither universality nor the requirement for unanimity, and particularly the combination of the two, is conducive to effective decision-making. Irresponsible voting by permanent or *ad hoc* groups of states can also make majority voting of dubious value and discredit the machinery. Concurrent majorities requiring two-thirds and three-quarters of the votes, together with weighted voting based, at least where economic or financial matters are concerned, in relation to the degree of responsibility of the member, are more conducive to meaningful results. So is the practice by which a member not wishing to participate in a particular exercise can abstain without blocking a decision of the others.

"Every nation has the right to express its own position and a legitimate desire to have its particular interests taken into account, but decisions have to be reached. Obviously decisions can most easily be reached by a comparatively small number of governments (the fewer the easier it is) with the greatest interest in and responsibility for a particular problem, a substantial background of common interest with respect to it, and the greatest ability to do something about it.

Coordinated Decision-Making Policies at the Global Level

"Functional problems lend themselves more easily to coordinated decision-making than broader or more general political and economic ones. With the functional approach, administrative questions and substantive ones which do not have a high political content can often be dealt with by majority voting, weighted roughly in accordance with the degree of responsibility.

Close Relationship Between International Officials and National Delegations

"Close relationships between international officials and national delegations in various institutions, between the delegations and their own governments, and between policy-makers in the various home governments are highly important. Such relationships facilitate both the making of decisions and the carrying out of even politically difficult ones by the respective governments.

"Personalities play a large part. The calibre of the heads and senior officials of international staffs and of national delegations, and naturally of the corresponding high ranking officials in the respective governments, is highly important. The

institutions provide continuity and the means by which strong personalities can achieve constructive results.... (*Ibid.*, pp. 12-29.)

Members of the Special Committee on Intergovernmental Organizations

One can readily imagine the power which such a world directorate would possess if the elite of Japan, America, Europe and Russia were to join hands. The USSR played an important role in manipulating the Western world into convergence. The goal is for Russia at some time in the near future to join the Western power team in 'managing the world.' Members of the Atlantic Council's Special Committee on Intergovernmental Organizations and Reorganization which produced "Beyond Diplomacy" were:

Chairman

Hon. Henry H. Fowler – Partner, Goldman, Sachs & Co; Former Secretary of the Treasury; Chairman, Atlantic Council

Consultant:

Sir Eric Wyndham-White – Former Director General of the General Agreement on Tariffs and Trade

Rapporteurs:

Hon. W. Randolph Burgett – Former Under Secretary of the Treasury; Ambassador to NATO and OECD; Vice Chairman, Atlantic Council

Hon. Theodore C. Achilles – Former Counselor of the State Department and Ambassador; Vice Chairman, Atlantic Council

Members:

Hon. Gardner Ackley – Professor, Henry Carter Adams University, University of Michigan; Former Chairman of the President's Council of Economic Advisors; Ambassador to Italy

Hon. George W. Ball – Partner, Lehman Brothers; Former Under Secretary of State; Director, Atlantic Council

Hon. W. Michael Blumenthal – Chairman, President and Chief Executive Officer, The Bendix Corporation; Former Deputy Special Representative for Trade Negotiations; Director, Atlantic Council

Dr. Zbigniew Brzezinski – Director, the Trilateral Commission; Research Institute of Communist Affairs, Columbia University

Dr. Miriam Camps – Senior Research Fellow, Council on Foreign Relations

Hon. Harlan Cleveland – Director, Aspen Program in International Affairs; former Assistant Secretary of State and Ambassador to NATO; Director, Atlantic Council

Mr. Emilio Collado – Executive Vice President, Exxon Corporation; Director, Atlantic Council

Professor Richard N. Cooper – Yale University; Director, Atlantic Council

Hon. Frederick I. Deming – President, National City Bancorporation; Former Under Secretary of the Treasury; Director, Atlantic Council

Dr. Richard N. Gardner – Henry L. Moses Professor of Law and International Organization, Columbia University; Director, Atlantic Council

General Andrew J. Goodpaster – Former Supreme Allied Commander, Europe; Director, Atlantic Council

Hon. Walter W. Heller – Professor, Department of Economics, University of Minnesota; Former Chairman of the President's Council of Economic Advisors

Mr. Tom Killefer – Vice President of Finance, Chrysler Corporation; Former Special Assistant to the Secretary of the Treasury; Former Vice President, Export-Import Bank and U.S. Executive Director, Inter-American Bank; Secretary, Atlantic Council

Mr. Robert Kleiman – Editorial Board, *New York Times*

Hon. John M. Leddy – Former Assistant Secretary of State and of the Treasury; Former Ambassador to the OECD; Director, Atlantic Council

Dr. Harald B. Malmgren – Smithsonian Woodrow Wilson Fellow; Former Deputy Special Trade Representative, Executive Office of the President; Director, Atlantic Council

Hon. Paul McCracken – Professor, Graduate School of Business Administration, University of Michigan; Former Chairman of the President's Council of Economic Advisors

Hon. William McChesney Martin – Former Chairman, Board of Governors of the Federal Reserve; Director, Atlantic Council

Hon. Edwin M. Martin – Chairman of the Consultative Group on Production and Investment in Developing Countries, The World Bank; Director, Atlantic Council

Hon. Livingston T. Merchant – Former Under Secretary of State for Political Affairs and Ambassador to Canada; Vice Chairman, Atlantic Council

General Lauris Norstad – Former Supreme Allied Commander, Europe; Vice Chairman, Atlantic Council

Hon. Arthur M. Okun – Senior Fellow, The Brookings Institution; Former Chairman of the President's Council of Economic Advisors

Mr. Henry Owen – Director, Foreign Policy Studies, The Brookings Institution; Director, Atlantic Council

Hon. David Packard – Chairman of the Board, Hewlett-Packard Company; Former Deputy Secretary of Defense; Director, Atlantic Council

Hon. Robert V. Roosa – Brown Brothers, Harriman and Co.; Former Under Secretary of the Treasury for Monetary Affairs; Director, Atlantic Council

Professor Eugene V. Rostow – Professor, Yale University Law School; Former Under Secretary of State; Vice Chairman, Atlantic Council

Hon. Dean Rusk – Professor, University of Georgia Law School; Former Secretary of State; Director, Atlantic Council

Hon. Nathaniel Samuels – Chairman, Louis Drayfus Corporation; Former Under Secretary of State for Economic Affairs; Director, Atlantic Council

Hon. J. Robert Schaetzel – Former Ambassador to the European Communities; Director, Atlantic Council

Hon. Adolph W. Schmidt – Banker; Former Ambassador to Canada; Director, Atlantic Council

Hon. Frank A. Southard – Former U.S. Executive Director of the IMF and Special Assistant to the Secretary of the Treasury; Former Deputy Managing Director and Vice Chairman of the Executive Board of the IMF; Director, Atlantic Council

Hon. Herbert Stein – Department of Economics, University of Virginia; Former Chairman of the President's Council of Economic Advisors

Hon. Alexander B. Trowbridge – President, the Conference Board; Former Secretary of Commerce; Vice Chairman, Atlantic Council

Hon. John W. Tuthill – Director General, Atlantic Institute for International Affairs; Former U.S. Representative to OECD and Ambassador to European Communities; Director, Atlantic Council

Hon. Paul Volcker – Professor, Department of Economics, Princeton University; Former Under Secretary of the Treasury for Monetary Affairs

Hon. Francis O. Wilcox – Executive Director, Commission on the Organization of the Government for the Conduct of Foreign Policy (Murphy Commission); Former Assistant Secretary of State; Director, Atlantic Council (*Ibid.*, back cover.)

The Strengthening of International Organizations

The elite of the Western world have created a set of powerful organizations to 'manage' the world order they have created over the last century. These include the International Monetary Fund (IMF); World Bank (IBRD); General Agreement on Tariffs and Trade (GATT), now the WTO or World Trade Organization; Bank for International Settlements (BIS) and the Organization for Economic Cooperation and Development (OECD). As one Trilateral Commission report states:

"While new institutions may be required in some areas, the general emphasis should be on the adaptation and reform of existing institutions, such as the IMF, GATT, OECD, World Bank and its affiliates, and others. New agencies may, however, be needed for the oceans, oversight of multinational corporations on stabilizing commodity prices...." (Richard W. Cooper, Karl Kaiser, Masatoka Kosaka, "Toward a Renovated International System," *The Triangle Papers: 14*, New York: The Trilateral Commission, 1977, p. 41.)

It is the IMF, OECD, IBRD, GATT and BIS which have served the elite world establishment so well. They are currently in the process of strengthening and updating the structural capabilities of these organizations in order to better manage the worldwide system which they have created. In 1994 they were successful in transforming GATT into the World Trade Organization, an effort which took over 50 years to accomplish.

As we enter the Twenty First Century, the movement toward a "community of nations" is accelerating at breathtaking speeds. The citizens of the next century will witness the creation of a "new Imperial System" that will rival the old Roman Empire.

8. The Third Try at World Order

Henry Steele Commager states in the closing section of his Declaration of Interdependence that 'we can no longer afford to make little plans....' These worlds are truly reflective of Harlan Cleveland's *The Third Try at World Order: U. S. Policy for an Interdependent World*. Cleveland's book is a result of the synthesized opinions of various Interdependence Assemblies sponsored by the World Affairs Council of Philadelphia. It is quite revealing and will be reviewed in this section.

In his foreword Cleveland states: "In preparation for the American Revolution Bicentennial of 1976, the World Affairs Council of Philadelphia commissioned the distinguished American historian Henry Steele Commager to produce a *Declaration of Interdependence*. But the world-minded Philadelphians were not content to leave that 'policy' at the level of eloquent rhetoric. Having declared our interdependence, they set about – as their ancestors had done with their Declaration two centuries before – to carry the words into action." (p. vii.)

Let us now look at several passages of Cleveland's essay on the "third try at world order."

Beginning the World Over Again

Cleveland begins his book with these words by Thomas Paine, 1775:

"We have in our power to begin the world all over again. A situation similar to the present hath not appeared since the days of Noah until now. The birthday of a new world is at hand."

First Try at World Order

In his first chapter, Cleveland outlines for us the series of attempts that have been made at creating a community of nations. He states that: "The first try, the League of Nations, was the product of Woodrow Wilson's strong initiative and the victim of his weak follow-through; the United States wrote most of the club rules, then decided not to join the club. In its weakened condition, it could not survive the rise of fascism, Nazism and militarism.

Second Try at World Order

"The second try, the United Nations, was launched by the victors in the Second World War, to manage the world they had won. It was weakened by tepid Soviet participation from the start, and transformed by the independence movement that nearly tripled its membership in thirty years. The U.N. received the unremitting support of the United States as 'man's last best hope' until (by the rules we had helped write into its Charter) the poor-country majority took over from us the practice of bloc voting on symbolic resolutions, thus intensifying our isolationist superfears and disappointing our internationalist superhopes. Today, the U.N. reflects quite accurately the political turmoil and tensions of a world in deep transition. But as presently organized and used by its members, it is ill-adapted to arrange the new bargains that are urgently needed, or for getting decisions made on a lengthening list of new global issues.

Third Try at World Order

"The third try at world order stems from the growing awareness of the interdependence of peoples, problems, and policies. It begins for Americans with changes in attitudes and institutions at home, and extends to leadership in fashioning new cooperative attitudes and institutions for a world that is not yet a community.

"We will not be talking about 'American leadership' in its old overblown, ethnocentric, self-righteous meaning, but about new styles of shared leadership, with a newly global perspective, in new kinds of institutions that better express how universal those first few paragraphs of Jefferson's 'Declaration of Independence really were.'" (Harlan Cleveland, *The Third Try at World Order: U.S. Policy for an Interdependent World*, N.Y., Aspen Institute for Humanistic Studies, 1977, pp. 2-3.)

Changes in American Attitudes and Institutions

Cleveland states that the Third Try at World Order "begins for Americans with changes in attitudes and institutions at home, and extends to leadership in fashioning new cooperative attitudes and institutions for a world that is not yet a community." (p. 3.)

Cleveland believes that: "The international organizations designed a generation ago by Atlantic leaders to govern the cooperation of all nations with each other show all the symptoms of multiple sclerosis." (p. 7.)

Long Agenda Ahead

Cleveland argues that: "There is thus a long agenda of creative effort just ahead. Somehow the community of nations – or at least of those most concerned – will need to create a food reserve, assure energy supplies, depress fertility rates, stabilize commodity markets, protect the global environment, manage the ocean and its deep seabed, control the modification of weather at human command, rewrite the rules of trade and investment, reform the monetary system, mediate disputes, reduce the cost of military stalemate, control conflict in a world of proliferating weapons, keep the peace when it is threatened and restore the peace when it is broken.

"It is this impressive agenda, taken as a whole, that will amount to a third try at world order. It will not, this time, feature the creation of some new overarching world organization. Rather, it will be a variety of bargains, systems, and arrangements which reflect the paradox of the world order – that there is no consensus to entrust any nation or race or creed or group with general responsibility for world governance, yet there is an urgent need to tackle problems which will yield only to world-scale solutions.

"...Living in a world where no body is in charge, but the United States of America always seems to get on the executive committee, will require of Americans some very special attitudes of mind and qualities of spirit." (pp. 8-9.)

Complete Disarmament

In chapter 6 Cleveland calls for complete disarmament of all nations and the placing of nuclear arms, etc., under the control of some international institution. He then makes the following recommendations: "In a world full of dangerous weapons and unusable military power, the control of arms by agreement cannot be an afterthought, or delegated to a specialized agency of government. The United States, as 'the fat boy in the canoe,' is in a position to take a strong lead in reversing the direction of all three arms races by:

"downgrading the usability of nuclear weapons;

"pressing hard and imaginatively for actual reductions in nuclear warheads and strategic delivery systems-and getting the rest of the world to help break down Soviet reluctance to get on with arms control (but that means we have to mean it ourselves);

"retarding the proliferation of nuclear 'mobilization bases' by shortening the 'nuclear parenthesis' in the development of future energy supplies;

"taking a fresh look at arms sales policy, developing first a U.S. policy that brings sales within the perimeter of our own national interest, and then pressing for parallel policies with other supplies (as is being done on nuclear exports through the 'London group');

"pressing for a world-wide agreement to deny terrorists the means of communication and transportation;

"and helping to beef up the U.N.'s capacity to provide 'third parties' for peacemaking and international units for peacekeeping." (pp. 47-48.)

World Institutions to Maintain Army

Cleveland states that it will be necessary to maintain certain "international 'soldiers without enemies.'" (p. 47.)

A Global Fairness Revolution

Cleveland starts chapter 7 with the following words: "If the General Peace can somehow be kept – and what other assumption makes sense? – the rest of world-order politics is how to organize a process of planetary bargaining about the prudent use of resources, the production and distribution of wealth, and the

management of global systems. The bargainers will be shifting casts of 'actors,' but Americans and their government are bound to appear in every act. That is why it's useful for us to review the whole plot as the on-stage posturing begins.

"The essence of the story will be the maturing of the next great world movement, a global fairness revolution. It has been preceded most recently by the Renaissance and the Reformation, the industrial revolution, and the revolutions of national independence, starting with ours. It coincides with vertiginous changes in scientific discovery and technological innovation, which are producing the first experiments in 'post-industrial' or 'information' societies. It vies for attention with a continuing superpower rivalry, with open competition and close alliances among the industrial democracies, and with old-fashioned power politics between and among neighbors in every world region.

"But I think it is a reasonable guess that the global push for fairer distribution of worldly goods will be on center stage...." (p. 49.)

"...some method will surely have to be found to make the meeting of basic human needs...a central purpose of a New International Economic Order." (p. 54.)

Family Planning in the New World Order

Continuing, Cleveland quotes an Aspen Institute international workshop as suggesting that "Family planning is an important means to the goal of meeting human needs...." (p. 62.)

A Blueprint for the Future

Cleveland next outlines that: "The third try at world order emerges,...as a creative surge of pluralistic institution-building in a world where no nation or alliance can call the new tune and write the new rules. It will have to be a dynamic peace system that preserves most of the existing forms of international cooperation and builds out from them in performing three kinds of functions."

I. An Interlocking Series of Systems

"One aim of international action will have to be an interlocking series of systems to make sure mankind as a whole stays well inside the seven 'limits' suggested by the diagram below.

The capital letters key to the diagram is as follows:

"A. A System for establishing and reviewing international standards for individual entitlement to food, health, education, and any other agreed components of 'minimum human needs'; and for relating international economic cooperation, including aid, to progress toward these standards.

"B. A system for international review and monitoring of national decisions about growth, affluence and waste in the more developed countries.

"C. A system that negotiates and monitors agreed standards of air and water quality, and reviews national actions that pollute beyond national frontiers.

"D. A system that keeps under review the damage and potential damage from man-made processes, and blows the whistle on those that may affect people beyond national frontiers.

"E. A system that promotes exploration for, and keeps a world inventory of, nonrenewable resources that may be needed by people outside the nations where the resources happen to be found.

"F. A system that monitors world production of food and fibers; seeks international agreement to limit overcropping, overgrazing, overcutting and overfishing; and provides for the exchange of timely information on national harvests and food requirements.

"G. A system that limits conflict by international conciliation and mediation, the deployment of peace-keeping forces, and (through arms control) the institutionalization of military uncertainty at the lowest possible cost."

II. New or Adopted Institutions to be Created

"Second: Beyond international attention to the sevenfold limits, there are functions which require new or adapted international institutions, to create agreed frameworks for planetary bargaining.

"Among the most urgent systems waiting to be born are those needed:

"To hold, finance, and manage buffer stocks of major world commodities, assuring continuity of supply and price stability for producers and consumers in relation to long-term market forces....

"To ensure access by developing countries to markets in the industrial countries....

"To help manage constructive shifts in industrial geography (for example, doing more processing of raw materials in the country of origin), and help nations plan investment in their own industries in the light of investment policies of other nations....

"To push agricultural productivity in the developing nations, and meanwhile to make sure there is enough food for all through a world food reserve (for which the

North American granary is bound to be the key source of supply during the next few years)....

"To promote cooperation between oil producers and consumers, to reduce energy waste in industrial societies, and assist developing countries in devising sound energy policies.... The developing nations, on their side, will need to adopt energy-saving and laboring-using strategies, and encourage foreign enterprises in the search for new energy sources. (The Soviet Union, now the world's largest oil producer with vast reserves of fossil fuels, could also make a contribution to world energy balance by welcoming joint ventures with the industrial democracies to develop its resources.

"To resolve differences among transnational enterprises, host countries and home countries over such issues as taxation, employment, competitive practices and contributions to meeting basic human needs.

International Taxation by International Institutions

"To raise funds for development financing directly by fees and taxes related to the use of international 'commons', and to marry the allocation of these funds to the meeting of minimum human needs inside each developing country.... The rationale for a new kind of development aid was suggested by the group which last year proposed a 'planetary bargain'; 'Rather than trying to pump life back into the worn-out policy of year-to-year decisions by individual governments on how much to appropriate and to whom it should go, what is needed is a flow of funds for development which are generated automatically under international control.... The idea of international taxation (on ships for their use of international waters, on international telecommunications, on ocean fisheries, on passports) is a hardy perennial, but we believe it should be treated as an idea whose time has come.... The key concepts here are automatic revenue-collecting by international agencies, related to benefits clearly derived from the taxpayers' use of the international commons; but use of the revenues to fund direct efforts to meet basic human needs in the poorer countries....'

"To provide for effective international consultation on actions by national monetary authorities which substantially affect the money supply, and create international money in a manner and at a rate that is compatible with economic growth at reasonable rates of inflation....

"To regulate conflict, promote research, develop protein, conserve fisheries, and explore, exploit and share the revenues from the oceans, the continental margin and the deep seabed. The world is now in the decisive phase of negotiations on a Law of the Sea treaty to govern the 70% of the earth's surface covered by oceans....

III. The Management of World Institutions

"The third and most 'natural' target for international action [is] the functions which are international by their very nature, and require world institutions to manage them:

"To collect and disseminate better information and guesses about the weather – and move toward international standards for weather modification.

"To develop the fairest and cheapest systems of international global communications, including the use of satellites.

"To create an international system for the use and protection of resource data derived from the constantly improving sensors operating from space vehicles.

" To promote research on common threats to mankind, such as damage to the ozone layer – and common opportunities for mankind, such as building solar power stations in outer space." (pp. 64-70.)

Rule by Consensus

In chapter 8, "The Third Try: World Order Diplomacy," Cleveland analyzes the difficulty in reaching decisions via consensus among groups and nations. He states the following:

"Whether the U.N. becomes the inclusive framework for the new order will depend not only on what its member governments intend, but on the way they make decisions together – and on the quality of policy analysis they encourage international executives to do.

"The U.N.'s voting procedure, which was derived from parliamentary practice in the West, has turned out to be a damaging handicap. It is clear now from a generation of experience that the more voting there is, the less action there is. This is sometimes true in clubs and villages and cities and national governments too: voting moves each issue to quick disagreement about words rather than careful agreement about action.

"The Charter, mostly written by Americans and other Westerners, established a pseudo-parliamentary system for making decisions. But that is not how decisions are made in most of the world; they are made in various fashions by consensus among those who have the capacity to act, and the interest in acting, on a given issue. And it is noticeable that in international meetings where action is the intended result, there is now an increasing trend toward 'no objection' or 'consensus' procedures rather than a 'division of the house' which makes the disagreements clear but inhibits doing anything about them." (p. 77.)

Cleveland continues and suggests that we rebuild the United Nations as one alternative in the multifaceted road to world order: "During the debate on U.S. objections to the U.N.'s 'automatic majority,' at the 1974 General Assembly, the Indonesian delegate spoke thoughtfully of his country's tradition of decision making through *musyawarah* and *mufakat*, consultations and consensus. "Most of our countries,' he said, 'have at one stage or another known that method. The process may be lengthy, cumbersome, sometimes exasperating, but we are much better off than immediately after our independence when we experimented with the "half-plus-one-is right" method....' As we rebuild the United Nations and/or begin to fashion new or adapted institutions to take on new international functions, the West will do well to look for viable alternatives to 'half-plus-one-is-right.'" (pp.77-78.)

Consortia of the Concerned to Manage the New International System

Cleveland states that: "What may well develop is a two-tier international system. Board initiatives and declarations of principle require some sense of participation by all who are affected by an international operation. But most of the new international operations are likely to be put together and managed by 'consortia of the concerned.' Even in the World Weather Watch – there is nothing more global than weather – most of the work is done and most of the money is spent by a very few nations, especially the United States and the Soviet Union which set up the first two big centers for processing the complex computerized meteorological data from all over the world. *Intelsat*, the communication satellite organization which the Soviets have not joined, is a consortium of the concerned which actually owns the satellites that now carry an enormous volume of the world's long-distance messages.

"Two principles will make a two-tier international system politically feasible. One is that in the operating entities – for environmental monitoring, commodity stabilization, food reserves, energy planning, investment regulation, monetary management, development financing, seabed exploration, or whatever – both the producers and consumers be fairly represented.

"That does not mean everybody should be in on every act, but merely that every nation should feel that its kinds of interests are effectively brought into the bargaining. This is in fact the way the Paris talks on oil and other issues were set up: 27 nations are discussing global issues that affect 150 nations. (One of several reasons why the Law of the Sea negotiations have not managed to agree on anything yet is that the periodic conferences include all 150 of the parties at interest.)" (p. 79.)

He goes on to state: "The other principle is that the smaller operating entities will have to have some obligation to report to and consult with the rest of the world, whose interests they are touching with their everyday operations.

"For this purpose a global assembly – the U.N. General Assembly for some functions, specialized assemblies or big ad hoc conferences for others – is an indispensable ingredient in the recipe for a consensus that enables those who are most involved to get on with a management task while keeping in touch with a wider consultation circle. There are many examples of this principle at work already – the Executive Directors of the World Bank, who represent regional groupings in the Bank's governance, and the Security Council of the United Nations, which has five permanent and ten rotating members, are cases in point." (p. 80.)

Global Education Processes in America

In chapter 9, "The melding of 'Foreign' and 'Domestic,'" Cleveland states that: "The domestication of international relations is not a theory about the future; it is a transition already under way." (p. 84.)

Branch of U.S. Government to Manage Interdependence

Cleveland next discusses several proposals that would call for the enhancement of the executive branch of government: "At the governmental level, every agency has its own international relations. Actions of the U.S. Department of Agriculture are among the most important decisions made about the world food balance. The Federal Aviation Agency maintains a web of transnational relationships to make global air travel safer. Federal energy agencies try to conserve fuel and encourage alternatives to imported oil – and thus determine what the United States and its industrialized allies can accomplish in negotiating with the oil producers' cartel. The Environmental Protection Agency finds that many forms of pollution require international cooperation to monitor and control. Each new technological breakthrough – fast computers, weather modification, remote sensing of crops and geological formations from orbiting satellites, discoveries in disease prevention, new ways to fish and drill and mine and build in marine environments – brings with it a new tangle of international claims and conflicts.

"In the so-called 'old-line' Departments, the interdependence functions are also of growing importance – Justice's immigration controls, Treasury's Coast Guard and debt-management operations, Commerce's weather service, and Interior's Pacific Islands are just a few of a hundred examples. The quasi-independent bodies also have foreign policies of their own. The Federal Reserve Board has a dominant voice in determining the growth rate of the world's largest stock of international money, the U.S. dollar. And the Nuclear Regulatory Commission has the power, which it has not yet decided how to use, to veto a White House decision to export nuclear materials or equipment.

"Despite these well-known facts, it is almost literally true that only one person in the executive Branch is hired to work on *both* domestic and international policy. His title is President of the United States.

"One of the most elementary doctrines about the management of large-scale systems is that a supervisory office should not be set up in the same way as its subordinate office – that, indeed it should be deliberately organized to cut across the vertical divisions below, in order to illuminate their interrelationships and inconsistencies before issues come to the top executive for 'decision.' Each of the Cabinet Departments was established essentially to deal either with national security/foreign policy matters, or with domestic policy. Yet the White House has for three decades been organized in the same way, coordinating State and Defense and the intelligence community through a National Security Council (NSC), and gathering the rest of the government into a "Domestic Council,' the lineal successor of a function performed by staff officers under a variety of names ever since the Truman Administration. Since the system does not fit the function, dissonance between foreign and domestic policies is normal. Most Americans remember how the price of bread in the local supermarket went up when the U.S. Government failed to regulate Soviet grain purchases in 1972. Lift the veil from the price of oil, the market for soybeans, the law of the sea, the sale of arms and the export of nuclear equipment, and you will find ready examples of international ramifications unpredicted, ignored or suppressed.

"What to do? There is no way that these interdependence issues can be stuffed into the one Cabinet department supposedly responsible for international affairs. Managing the U.S. involvement in international bargaining, and relating the transactions to each other, will still be the job of the Secretary of State as the President's deputy for dealing with foreigners. But the *content* of these negotiations reaches so deep into American politics (the oil crisis is displayed at the filling stations, Soviet wheat purchases raise the price of bread at the local supermarket, decisions about the global money supply are felt in the consumer's pocketbook) that the Secretary of State can't become fully responsible for them without being elected President. With the two unimpressive exceptions already noted, that hasn't happened since John Quincy Adams.

"The answer is probably to view foreign policy, Adam Yarmolinsky suggests, as 'not a subject matter for government decision-making; it is rather an aspect of every important government decision.'

"The implications are far-reaching. If logically pursued, the White House 'domestic council' would become an 'interdependence council,' and would include the Cabinet officers responsible for foreign relations and defense management. Below the White House level, Cabinet and sub-Cabinet officers in each department would be recruited to play personal roles on a world stage, explaining the United States policy and absorbing criticism directly not filtered through the State Department.

"The Secretary of Agriculture should know that one of his primary mandates (working closely with the agricultural constituency and with Congress) is to help

establish a system of world food reserves, rearranging general incentives in such a way that they reward not scarcity but abundance.

"Officials charged with energy policy would think of their function as part of a world system designed to ensure fuel supplies to allies and developing nations as well as the United States, and also designed to minimize the proliferation of the capacity to develop nuclear weapons.

"The Secretary of the Treasury would know that his mandate includes helping to invent a more international monetary system and finding ways to finance buffer stocks of major world commodities, to assure continuity of supply and price stability for producers and consumers in relation to long-term market forces.

"The Secretary of Commerce would as a primary task work toward effective international arrangements to resolve differences among transnational enterprises, host countries and home countries over such issues as taxation, employment, and competitive practices. "The President's ranking deputy for world-order diplomacy would still be the Secretary of State, the ranking American negotiator in an increasingly complex international decision process. But the department he heads could not even dream of having a monopoly of 'foreign affairs.' For the whole government, international policy would be part of day-to-day decision making.

"To serve as the opposite number to a White House-based interdependence council, Congress would need a joint committee on interdependence. Here there are several useful models – the joint committees on the economic report and on atomic energy, and the arrangement now being tested for a Congressional Budget Office tied in with two committees on the budget that are supposed to balance total Federal income and outgo.

"The interdependence issues cut across the traditional jurisdiction of Congressional committees, just as they cut across the responsibilities of existing executive departments. A joint standing committee with explicit responsibility for analyzing such cut-across issues might give the public something of Congressional origin to compare with the President's proposals, and thus enable the Congress to avoid the present unhappy choice between sounding negative or appearing acquiescent." (pp. 84-87.)

Americans Urged to Think of Themselves as Citizens of the World

Cleveland next quotes a commission convened by Robert O. Anderson, former Chairman of the Board of Trustees of the Aspen Institute. The Commission called for Americans to be thinking of themselves as "citizens of the world." Cleveland begins as follows:

"In 1975 a National Commission on Coping with Interdependence (not appointed by the Government but convened by businessman Robert O. Anderson)

ruminated about all this and decided that the key to making sense, for naturally pluralistic Americans in a necessarily pluralistic world, is 'to rethink this fading distinction between 'domestic' and 'international.' It is 'a staggering assignment,' the commissioners conceded. 'But it is,' we believe, 'central to our future for Americans to act, each in his or her own context, as though we really were citizens of the world as well as residents of our favorite part of it.

"This basic change of attitude will not come in the first instance from executive edicts or legislative enactments. It will come from a review of the implications of interdependence by each of the major institutions which help govern our pluralistic policy – by corporations and their associations, by organized labor, by farm organizations, by foundations and non-profit enterprise, by school systems, colleges and universities, and educational associations, by newspapers, magazines, the electronic media and journalism associations, and by governments, municipal and state as well as federal....

"No group of citizens can prescribe in detail the actions each American organization should take to cope effectively with interdependence. Our society is too thoroughly pluralistic for that. What we have done, instead, is to suggest an attitude – already present in some degree in some institutions, but yet to emerge in others. Our central theme is as old as the Declaration of Independence – that everything Americans do should be measured by its effect on the rights and duties of "all Men," Because Americans need to be self-conscious citizens of the world

"Each American institution might usefully create its own tailor-made checklist for the interdependence era, from such general urgings as these:

"We can express our organizations' purposes in world terms, as our Founding Fathers did 200 years ago.

"We can bring non-Americans into our future planning.

"We can place the leadership of any overseas operations in the hands of local non-Americans, just as soon as they can take it on.

"We can make sure our house organs and other publications are carrying news and opinion about international developments that affect our organizations' purposes."

We can focus on American interdependence in some of our year-round local activities and in part of our annual conference or management meeting.

"We can ask ourselves, from day to day and month to month, are we doing as much as we can to reflect the fact of growing interdependence in our own plans?"

"We can encourage those activities, educational and cultural, which seek to broaden American understanding of other peoples, their heritages, histories and aspirations." (pp. 89-91.)

The American Role in Global Politics

Cleveland concludes his last chapter, "Attitudes in Transition," with these words: "The third try at world order will require much of Americans, because they happen (or have chosen) to be citizens of the only nation that is truly global in its reach. But maybe we need this new adventure in 'world order politics' as an instrument of American self-renewal – that is, to get our tall ship back on a course that has history with it, not against it." (p. 100.)

Cleveland's book carefully outlined the goals and philosophy of the elite who are seeking to develop a community of nations and eliminate the power and influence of the nation-state. The American people have a clear choice ahead. Will they embrace the world order politics outlined by Cleveland and the elite financial oligarchy or will they choose to maintain their freedom and sovereignty in a nation-state environment. The decades ahead will be full of great challenges and ideological battles. The key question is whether the nation-state is strong enough to withstand the onslaught of powerful global forces seeking to forge a "New Imperial System."

9. Economic Disarmament – The Role of the International Chamber of Commerce

Introduction

In 1938 George L. Ridgeway, an Associate Professor of History at Wells College, wrote a revealing volume entitled *Merchants of Peace – Twenty Years of Business Diplomacy Through the International Chamber of Commerce, 1919-1938*. In the opening paragraphs of the introduction he said:

"The idea of an international regime of law based upon popular consent and sustained and developed by organized opinion throughout the world was implicit in the prewar democratic conception of a world parliament which gave birth to the League of Nations....

"Prewar internationalism embraced ambitious attempts to give precise institutional form to the conception of public opinion as an instrument of international action. The Socialist International was perhaps the most dynamic of these efforts. All these organizations had as their objective some form of cooperation action.... Among them the International Congress of Chambers of Commerce was notable as an institution devoted both to the organization of opinion and to cooperative efforts at technical research....

"The postwar years of European reconstruction saw this business international reborn into the new world parliamentary regime centered at Geneva. The story of the organization of the International Chamber of Commerce...is, in fact, meaningless apart from the history of the early days of postwar reconstruction. The discussions of the true organization conferences held at Atlantic City and at Paris throw a revealing light upon the economic forces which motivate international relations centering in the crucial meetings of the Allied Supreme Council, the Council of the League of Nations, the first Allied-German conference of Spa, the International Financial Conference of Brussels, and the Brussels Reparations Conference of Experts...." (New York: Columbia University Press, 1938, pp. 3-4.)

The Transfer of Political and Economic Sovereignty to International Bodies

Professor Ridgeway is telling us three basic things in his opening remarks. First, there is a concerted and coordinated effort to transfer political and economic sovereignty from the nation-state to international bodies. Second, the international bodies, which are to possess rule-making authority, are to be molded or adapted to public opinion so as to secure their construction and operation. Third, there are "economic forces" in the world which includes, of course, the prime economic forces, multinational corporate directors, international bankers and investment bankers who are designing, sponsoring and implementing policies which are designed to alter international relations. The intended result is a transformation of the nation-state world based upon economic nationalism into a single global economic unit. To accomplish this long-range goal the corporate directors are willing to support and cooperate with organizations such as the Socialist International, etc.

The Objectives of the International Chamber of Commerce

Professor Ridgeway proceeds to outline one of the predominant objectives of the I.C.C.:

"...The newly founded I.C.C. became the center of a movement by liberal business men which had as its objective the overthrowing of the surviving wartime domination by governments of international economic relations. This group of business liberals included such important leaders as Clementel, Pirelli, Leaf, Sir Felix Schuster, Willis H. Booth, Owen D. Young, Roland W. Boyden, Filene, Nelson Dean Jay, Henry Robison, William Thys, Edstrom, H.R. de Mosch, Francis Hlavacek, and K. A. Wallenberg...." (Ridgeway, p. 4.)

The Destruction of Economic Sovereignty

In other words, one of the main goals of the I.C.C. was to destroy the economic sovereignty possessed by national governments. It is interesting to note that Professor Ridgeway used the phrase "surviving wartime domination." Undoubtedly he is referring to that fact that war has a tendency to centralize government control.

During and after the First World War there were attempts, some successful, of transferring economic sovereignty to the League of Nations, and to the Executive Branch of the United States Government. Professor Ridgeway continues:

"...The history of the I.C.C. is the story of international cooperation by representative businessmen.... Freedom of the I.C.C. from political control [of nations] has allowed the development of a unique relationship between business and government in the international sphere. This relationship has not only permitted the I.C.C. to exert a powerful nonpolitical influence upon the international aspects of the vast and complex systems of technical and business law-making and administration centered at Geneva, but it has also made it possible for the I.C.C. to formulate a business policy and to intervene in the three major political-economic international questions of the postwar era: reparations, war debts, and trade barriers...." (Ridgeway, pp. 4-5.)

Technical Facilities Designed to Promote a Global Economic, Trade and Banking System

There is currently centered at Geneva the largest assortment of technical facilities in the world designed to promote and sustain a global economic, trade and banking system. Professor Ridgeway noted:

"...All the wealth of technical competence available in Geneva for the reconstruction of international finance was bared by sovereign states from the reparations and war debts scene. League [of Nations] technicians were permitted to enter only when actual collapse had either taken place or was imminent, as in the case of Austrian and Hungarian reconstruction. The businessmen of the I.C.C., however, were not subject to government control. Experts from its membership were on the spot from the very beginning in the ranks of the Allied governments, and business leaders from the I.C.C. participated in League reconstruction in Central Europe. The I.C.C., moreover, afforded an opportunity for carrying out, with the full participation of American business, that policy of nonpolitical cooperation which had been a feature of the United States' foreign policy since the war. Consequently, the I.C.C. became a clearinghouse for important lines of influence and interest. The Allied interest, the League reconstruction interest (reflecting more nearly an international point of view), the American interest, and finally the German interest were all ably represented within the I.C.C. in the formation of an objective business policy on the crucial postwar problem of a settlement of war costs. The final acceptance by governments of the settlement of reparations by two committees of businessmen, drawn largely from the council of the I.C.C., was not a historical accident. The Rome plan for world restoration drawn up by the second congress of the I.C.C. preceded the Dawes plan. Nor were the dates of the Washington I.C.C. congress and the Hoover moratorium wholly a matter of happy coincidence. The story of the evolution of international policy from reparations through European reconstruction to world restoration parallels in

large part the history of business thought and action within the organization of the I.C.C." (Ridgeway, pp. 5-6.)

The Postwar Period was Planned by Powerful Businessmen

It is apparent that the postwar period of the 1920s and 30s were carefully planned by powerful businessmen throughout the world. Businessmen and international bankers instigate and control international economic, monetary and trade policy. Their control over these vital areas has been apparent since the 1900s and earlier. Professor Ridgeway verified these observations when he said:

"...The evolution of postwar economic policy dealing with the problem of world restoration raised the question of trade barriers and tariffs. Here again the I.C.C. served as a clearinghouse for the powerful business interests which control the formation of international commercial policy...." (Ridgeway, p. 6.)

Powerful Business Interests Control the Formation of International Commercial Policy

There are, as noted above, "powerful business interests" which have controlled the "formation of international commercial policy" since the early days of the British Empire. The business leaders are now spread not only in "The City," but throughout the world. One way to bring to pass a single global economic unit covering all continents is to construct an international body designed to lower tariffs. Professor Ridgeway elaborated on the fact that the "powerful business interests" were preparing such commercial and trade policies in the 1920s. Their goal was to progressively lower tariffs until we reached a zero-base tariff system for all nations. Trade and commerce would be controlled at the international level through a global institution such as the proposed International Trade Organization of 1948, the GATT, and the proposed Production and Trade Organization of 1980. Professor Ridgeway states:

"...The disasters which have followed the failure of the 1927 movement for economic disarmament mark the bitter ending of successive national policies conceived in the supposed interest of national economics assumed to be isolated by national frontiers from outside influences. Although the I.C.C. was unable to rally certain powerful business forces (not only in the United States and France) to the cause of tariff reform in time to avert present calamities, its continued advocacy of world economic disarmament has contributed to a second world movement for tariff reform, led this time by the United States.

"Into this new movement for economic disarmament the I.C.C. has thrown all its influence. In 1935 under the leadership of Fentever Van Vlissinger the I.C.C. joined the Carnegie Endowment for International Peace in setting up a committee of economists and business men, after the manner of the Dawes committee, with instructions to conduct an exhaustive survey and study of the principal aspects of

international economic relations. This committee of experts issued a series of documents and list of recommendations based upon the fundamental principle 'that world peace and a return to prosperity through the revival of world trade are one and indivisible.' The work of the committee of experts has been made the platform of a world-wide effort by the I.C.C., directed by the recently elected American president of the International Chamber [of Commerce], Thomas J. Watson. The new president is well known as an ardent supporter of enlightened trade policies...." (Ridgeway, pp. 6-7.)

The Lowering of Tariffs Throughout the World

It is interesting that the I.C.C. considered the lowering of tariffs in the United States and throughout the world as "economic disarmament." It is, in reality, economic disarmament when one considers that the so-called practice of free trade allows importing nations or industries to destroy a nation's industrial base through unfair business practices, thus disarming the country. Professor Ridgeway next outlines the distinguishing feature of the I.C.C.:

"...The strength and driving force of the I.C.C. are the result of the combination of technical ability and economic power which distinguishes this world association of businessmen. The I.C.C. is a technical bureau of a unique character. It is a bureau set up on popular representative lines. The working members of the bureau and representative businessmen, organized in national headquarters of the I.C.C. maintained in Paris, is not, strictly speaking the bureau, but the secretariat of the bureau. The bureau itself is composed of experts who are at the same time representatives of powerful economic interests...." (Ridgeway, pp. 7-8.)

The Development of a World Commonwealth

Professor Ridgeway concludes his introduction by pointing out that one of the larger goals of the I.C.C. is a system of global governance where the nation-state is slowly phased out of real existence.

"...The ideal of a world commonwealth based upon a community of economic interests is at the back of all international economic cooperation. The I.C.C., in the form of its organization, has attempted to embody this ideal in a growing, living institution...."

"It [the I.C.C.] has sought to cooperate with all classes and groups in the peaceful solution of common business problems of international interest. The World Economic Conference of 1972, for example, saw the representatives of the I.C.C. and of the International Labor Organization standing shoulder to shoulder for the cause of economic disarmament against powerful national industrial interests. These cordial relations between the I.C.C. and the I. L. O. are indicative of the common interests of business management and labor in great international economic enterprises, the primary objective of which, when considered as part of

the larger interest of a world commonwealth, are a higher standard of living and a more abundant life...." (Ridgeway, pp. 8-9.)

The Tremendous Influence of Bankers and Merchants in London

Merchants of Peace was divided into five parts by Professor Ridgeway. In Part I entitled, "Prepay – A Business Men's International," he outlines the tremendous influence of the bankers and merchants in "The City" of London.

"...The origin of postwar collaboration in the field of economic policy is to be found in the prewar capitalist system. International cooperation had developed to an extraordinary degree when we consider the instability of the international political foundations upon which it was built. The capital of the world economic community before the war was London. Under the shelter of the liberal imperial authority at Whitehall, but never overshadowed by it, the City of London exercised the major control over the world's capital markets and through these markets over the great process of the production and distribution of wealth..... It was based upon a very large and complex system of business cooperation which had gradually been established to meet the needs of...profitable investment all over the world. Its development was connected with the expansion of the British Colonies, but it far transcended in influence and authority the limits of the Empire. The concentration of resources for such a vast free-trade area in one center automatically created a controlling influence in world finances. Any study of the history of international loans before the war would lead us straight to the square mile which comprises the City of London.

"The financial control centered in London before the war was supplemented by the growth of an international consciousness throughout the economic world...." (Ridgeway, pp. 13-14.)

Concentration of Political and Economic Power in London Through an Overshadowing World Financial Combine

Thus we see the economic and political power of the 18th and 19th centuries, that was concentrated in an area of London known as "The City." It is within this small area that the international bankers, merchants and corporate directors controlled the world's financial system. London was the capital of the world as far as international finance and trade was concerned. It maintained this position until the early 1900s when new financial cities, such as New York, were created. Professor Ridgeway noted:

"...The new conception of national monetary policy as a part of an international policy was necessitated by the passing of the complete domination of the City of London over the markets of the world. Changed conditions involved the substitution of an international authority for the authority of The City. In the prewar capitalist world such principles as those laid down in the memorial of 1920

(a document prepared by leading bankers and businessmen of the Western world containing recommendations on how to review world trade and the procedure for granting of credits) were quietly applied through the cooperation of the great banking houses and their international ramifications centralized in the City of London. The war had forced the widening of this overshadowing world financial combine through the sale of securities and currency inflation until it included a large section of the general public over a great geographical area. The very foundation of the prewar system of control was a...world monetary standard anchored to sterling. World-wide depreciation had resulted in the undermining of this basis and threatened the collapse of the entire system. To save this foundation, (banking) built of 'the savings of the past,' the memorial asked the people of the world to cooperate.

"The sweeping character of the revolution which they had accomplished within the inner financial citadel of the capitalist system finds no more striking illustration than the popular terminology of the memorial of 1920. The City was no longer the controlling partner in the world's business...." (Ridgeway, pp. 43-44.)

The Breakup of the Old World Order

World War I signaled the breakup of the old world order or concert of powers in Europe. The United States was to now actively participate in the development of a new concert of power and was soon to emerge as the leader of the postwar system. It would serve this role from 1945 until 1971. Professor Ridgeway notes the difficulty which the Allied powers had when they attempted to bring the United States into the financial combines of the world:

"...The interest of the Allied and associated powers in reparations had forced them into a position somewhat similar to that of a giant holding corporation, which dominated the world's economic life. Private enterprise must wait the decisions of this overshadowing international combine before it could act with any certainty of the future. The withdrawal of the United States, who had been the largest shareholder in this combine, complicated the problem beyond measure, for it placed the major part of the company's assets under the shadow of a huge and indefinite mortgage. Nevertheless, the course of events was ominous. The minority shareholders in the huge financial undertaking of the war were therefore forced to attempt to draw up a settlement. This settlement involved first of all a settlement of the part of the common enterprise which was in the province of their control – reparations. Accordingly, during the first treaty year, Allied statesmen sought informally to come to an amicable agreement upon the percentage of the total reparations claim to which each government was entitled and upon the total amount to be collected from Germany...." (Ridgeway, pp. 50-51.)

Bailing Out the Financial System of Germany

The withdrawal of the United States from the financial combine of Europe was an official withdrawal meaning the United States Government. American bankers and businessmen in concert with their European allies were attempting to bail out the financial system of Germany with United States money from the taxpayers. The bankers and businessmen wanted the United States to back the German reparations thereby guaranteeing that the bankers and businessmen would totally recover from the war. Professor Ridgeway states that Carter Glass, Secretary of the Treasury, turned the European governments over to private investors which temporarily frustrated the goals of the financial combines of Europe. He said:

"...The limits of American governmental assistance to European and American business reconstruction interests were set down by Secretary Glass as follows:

"The government of the United States cannot tax the American people to meet the deficiencies arising from the failure of the governments of Europe to balance their budgets, nor can the government of the United States tax the American people to subsidize the business of our exports. It cannot do so by direct measures of taxation, nor can it look with composure on the manufacture of bank credits to finance exports when the requirements of Europe are for working capital rather than for bank credits.'

"In the view of the United States Treasury, 'the demand for a resort to such impracticable methods as government loans and bank credits would cease' when European peoples and governments returned to the principles of sound finance and decided 'to live within their incomes, increase production as much as possible and limit their imports to actual necessities;' for foreign credits sufficient to cover adverse balances would most probably be forthcoming under such circumstances from private investors. Having turned European governments over to private investors, the Secretary closed with the classic American advice on reparations security:

"There is no more logical or practical step towards solving their own reconstruction problems than for the Allies to give a value to their indemnity claims against Germany by reducing those claims to a determinate amount which Germany may be reasonably expected to pay, and then for Germany to issue obligations for such an amount and be set free to work it out. This increase of Germany's capacity to pay will restore confidence and improve the trade and commerce of the world. The maintenance of claims which cannot be paid causes apprehension and serves no useful purpose.'

"...Secretary Glass' denunciation of governmental aid for the European reconstruction program, it should be noted, was applied in the same unsparing terms to American export subsidies of every description. The Secretary's policy called for a relaxation of government control in the United States as well as abroad.

The success of this policy was plainly dependent, as the Secretary asserted, upon the reestablishment of the freedom of exchanges both in goods and in gold. In short, the policy of the United States government in 1920 was directed toward taking government everywhere out of business and basing reconstruction upon business cooperation. This policy, it should be noted, was in sharp disagreement with the demands for the use of political control in economic affairs evident in the business planning at the International Trade Conference at Atlantic City. American business interests were destined eventually to oppose successfully the application of this philosophy in the matter of European reparations. The principle of political control of domestic markets, however, was to find wide application under American leadership in the general race in tariff armaments which has characterized postwar economic history...." (Ridgeway, pp. 47-48.)

Control of the Tariff Policy of the United States

American businessmen and bankers were hopeful of using the government to further their long-range goals for control and domination of the world in concert with their counterparts in Europe. Their goal was to place officials in key places and then for them to guide United States' policies along predetermined lines set down by those in New York, London, Paris, etc. Eventually the bankers and businessmen captured the Executive and Judicial Branches of the government and made substantial headway in controlling certain Congressmen. Professor Ridgeway admits that American businessmen were successful in the tariff war. Control of the tariff policy of the United States government was transferred to the Executive Branch in the 1934 Trade Agreements Act.

Laying the Foundation for a New International System

From the writings of Professor Ridgeway the reader comes to the quick conclusion that postwar economic planning was far more extensive than many had imagined in or out of government service. The global planners were busy laying the foundation for a new international monetary, finance and trade system. It would affect almost every person on earth in one way or the other.

The Almost Invisible Postwar Planning Movement

Professor Ridgeway continues his discussion of the almost invisible reconstruction movement or postwar planning by the financial combines of America and Europe:

"...The activity of the League [of Nations] itself was but indicative of the great movement for reconstruction which was going on outside the limits of official government channels. This movement centered about the activities of businessmen in Europe and America. It found collective expression, as has been pointed out...in the scheme to organize the International Chamber of commerce. American liberal

business opinion...found a united purpose in the project of a nonpolitical world organization of businessmen....

"The movement toward reconstruction was, in fact, only visible in its narrowest political aspects in the governmental conferences of Allied statesmen...." (Ridgeway, pp. 55-56.)

Powerful Economic Forces Guiding International Relations

The reason that postwar planning was almost invisible was because it was being engineered not by governments, but by the powers which preside over the fate of nations. Professor Ridgeway next outlines the founding of the International Chamber of Commerce.

"...The Organization Conference of the International Chamber of Commerce revealed the reconstruction movement in transition from an Allied to an international organization. This transition in organization was parallel in the sphere of policy. The discussions of the conference show the beginnings of a return from the coercive conceptions of war to the normal cooperative business concepts of peace. The conference divided on these lines, some advocating a return to normal laissez-faire business procedures and others a continuation of some form of special governmental or quasi-governmental aid involving the use of political authority. This division was accentuated in the discussion on financing the reconstruction of the devastated region. The influence of the American investment market upon this question was apparent in the proposals to utilize reparations bonds as a basis for reconstruction financing. The possibility of the need for cooperation as well as coercion in the reparations end of this transaction was foreshadowed....

"It would be difficult to find a more illuminating expose of the economic forces motivating international relations than that presented by the representatives of these forces themselves in the frank, unofficial exchange of views which took place at the Paris business conference.

"Representation of French industry and the large delegation of a hundred and forty prominent American businessmen served the immediate purpose of bringing American business to grips with the problems of Allied reconstruction market...." (Ridgeway, pp. 59-60.)

Reforming and Strengthening the International System

The majority of postwar economic planning by the global industrialists and bankers surrounded the expansion and revitalization of the trade, monetary and finance system which had developed over the last two centuries. Reforming and strengthening the global system were predominant in their minds, since governments were mere tools of these powerful forces. They were seen as instruments which could be used to further their long-range plans. Siphoning the

people's money through taxation to further guarantee and expand their private projects was seen as a necessary step in furthering the financial empires of the industrials or directors of multinational enterprises and global bankers.

Laying the Foundation for International Cooperation

Professor Ridgeway next proceeds to outline the organization of international reconstruction. An International Financial Conference was held at Brussels on September 24, 1930. At this meeting, according to the professor, the "foundation of the useful work of international cooperation in economic affairs, carried on by the League of Nations, was laid down...." (Ridgeway, p. 102.) He states: "...To facilitate the formulation and execution of [postwar economic] policy so evolved, industrialists and businessmen have been invited to cooperate with the result that an amazing degree of international economic integration had been achieved...." (Ridgeway, p. 92.)

The Need to Establish Central Banks

"...A general program was elaborated, including the freeing of banks of issue from political pressure and insuring their future operation solely on the lines of prudent finance, the stopping of further issuance of governmental and municipal credit and the refunding of floating debts, the use of credit solely for real economic needs controlled merely by the normal influences of the rate of interest, the freeing of commerce as soon as possible from control and impediments to international trade, and the avoidance of all superfluous expenditure. The possibility of international cooperation in national reconstruction was foreshadowed in Resolution XIV, proposed by the commission on currency and exchange. The resolution read:

"In countries where there is no central bank of issue, one should be established and if the assistance of foreign capital were required for the promotion of such a bank some form of international control might be required." (Ridgeway, p. 98.)

The Call for a World Central Bank

The International Financial Conference was proposing that central banks, such as the Federal Reserve, be free from "political pressure." In other words, central banks were to be free of governmental regulations and were to remain instruments of the private international bankers. Another major proposal of the conference laid the groundwork for the worldwide reductions of tariffs and the so-called doctrine of free trade. Remember this is 1930 and we can see that elaborate postwar economic plans of a global nature were being advanced upon conference participants. These plans were formulated by the international financial combines of the world. The conference also called for the establishment of central banks in those countries where they did not exist. Central bank cooperation was also

promoted when one of the participants "proposed the creation of...an independent bank of issue under international management...." (Ridgeway, p. 98.)

Establishment of the Bank for International Settlement

The Bank for International Settlements would be formed shortly in Basle (Switzerland), fulfilling part of this concept. The conference also called for military disarmament.

The Encouragement of Equilibrium in the International System

The Allied nations owed the United States \$11,000,000,000 as of March 1, 1920. Professor Ridgeway records an interesting remark made on this subject by one of the conference participants.

"The grave dangers inherent in the position of the United States as the greatest creditor nation and the greatest importer of European goods were discussed at some length in [G.] Vissering's [Dutch participant] outline of the world monetary situation. Vissering pointed out that the debtors of and purchasers from the United States would be compelled to bid against each other in the open market in order to be able to secure a part of the insufficient number of dollars for remittance purposes. The gravity of these circumstances was increased by the fact that this exceptional position of the United States must inevitably obtain for a long time. 'In a word' said [G.] Vissering, 'is it not to be feared that a situation would arise fatal for the debtor countries but eventually also very unfavorable for the U.S.A.' A fresh equilibrium would in the long run of necessity be arrived at, but only after and at the cost of an enormous amount of trouble and misery, a further dislocation of prices and of social conditions in the greater part of the world, and the encouragement of a revolutionary and Bolshevik spirit. The United States, Vissering went on to predict, would eventually be affected by the recoil of all this.' (Ridgeway, pp 97-98.)

What G. Vissering was acknowledging is that the Communist menace would be allowed and encouraged to grow to allow "equilibrium" in world affairs.

The Ter Muelen Plan

Professor Ridgeway next gave the reader a brief overview of the Ter Muelen plan which was adopted at the conference.

"...The question of credit was considered very fully by the conference; the result was the drawing up of a general plan of international cooperation known as the Ter Muelen Plan.... The plan...provided for the constitution of an international commission, under the auspices of the League of Nations, consisting of bankers and business men of international repute, appointed by the Council of the League, with the power to appoint subcommissions to exercise the commission's authority

in participating countries. This commission and the subcommissions acting under its authority were to act in the capacity of an international agency for supervising the issuance of credits to needy countries....

"The procedure outlined by the plan required, first, the placing of specific assets in the hands of the commission for examination and assessment in gold value, as security for commercial credits to be granted by the nationals of exporting countries. The participating government should then be authorized to prepare bonds to the gold value approved by the commission, the date of maturity and the rate of interest to be determined by the participating government in agreement with the commission. The service of these bonds was to be secured out of the revenue of the assigned assets. The administration of the assigned assets, while in the first instance placed in the hands of the participating government, would be subject to transference to the commission at the decision of the Council of the League of Nations under the commission's application. The bonds, having thus been issued in accordance with the recommendations of the international commission, were to serve as collateral security for imports by nationals of the participating state. It was stipulated that the bonds should be made out in such currencies and in such denominations as should be applicable to the particular transaction in respect of which they were issued. An extensive control over the uses of these bonds was provided by the further stipulation that all applications to participating governments must furnish proof that the imports for which the bonds were to be used had been approved by the international commission, and it was provided that each bond should be first countersigned by the commission in proof of registration. After the transaction had been completed the bonds were to be returned to the government of issue. The plan provided for the assignment of the revenue from the assets, to the service of the bonds, for the purchase of foreign currencies sufficient to meet at their due date the coupons of the bonds. Provision was made for the establishment abroad in appropriate currencies of sinking funds for redemption of ten percent of the bonds at maturity and for the establishment of a special reserve in one or more foreign currencies for the redemption of bonds which might be sold in case of default in the original transaction...." (Ridgeway, pp. 99-100.)

The International Plan of Reconstruction

This meeting was of tremendous importance in furthering international financial cooperation among the nations of the earth. Professor Ridgeway concludes his discussion of this conference as follows:

"...Thus an international plan of reconstruction, in opposition to Allied and national plans, was brought forth at Brussels. The Ter Meulen scheme was itself the result of years of study and discussion in circles of experts. The Brussels conference, therefore, brought the two systems of reconstruction clearly in the open. The Allied plan...in the last analysis rested upon the combination of Allied interests. On the other hand, the international system of reconstruction, in process

of evolution, was based upon the realities of present business assets in a world order, dominated not by surviving alliances but by the requirements of normal international trade. These two systems were to contend for mastery over international relations. The conference at Brussels, by providing an airing for plans of international cooperation, served to concentrate public opinion upon the new postwar problems. The idea of considering questions of national public finance in an international conference is in itself indicative of the change which had taken place in economic affairs since 1914. The detailed program of international financial assistance embodied in the Ter Meulen plan was a specific product of this new international philosophy.... (Ridgeway, pp. 100-101.)

Creation of a New World Order

The old world order dominated by the financial combines of Europe were being challenged by growth and dissension. A new world order was thus in the process of development. There is no question who maintained financial supremacy in the new order – the same powers as before only now enlarged to add new members.

International Conferences Used to Promote the Plans of the Financial Powers

International economic, financial or trade conferences are merely educational facilities used to instruct the participants in a particular viewpoint. Concepts, policy recommendations, etc., had been worked out beforehand by the technicians of the financial power structures. In other words, the plans which had been preconceived by the key bankers and businessmen are discussed and introduced at various conferences by close associates. This process guarantees the desired results. Professor Ridgeway illustrated this process when he said:

"In the discussion of the finance group of the First congress of the International Chamber of Commerce, London, June 27 to July 1, 1921, Sir Drummond Fraser, organizer of the Ter Meulen scheme, asserted that the scheme had been threshed out in almost every possible detail for at least two years before it was launched at the Brussels conference." (Ridgeway, p. 100.)

The Construction of a Single Global Economic Unit

A new era was dawning upon the world. International financial cooperation between the bankers and businessmen (corporate directors) was to become institutionalized in international conferences designed to further construct a single global economic unit. These goals were stated in London at a meeting of the First Congress of the International Chamber of Commerce from June 27 to July 1, 1921. Professor Ridgeway records another interesting statement of one of the participants.

"...Alluding to the speeches made by American representatives at the Atlantic City and Paris conferences, which, he explained, he had made it his business to

read, Lord [Viscount] Birkenhead [Lord Chancellor – British government] observed that whatever the political goal of America, 'not even the Monroe Doctrine,' at any rate, as far as the world of business was concerned, could prevent the realization of the great truth that the world was one and indivisible, and that the United States of America, not only geographically but by every material standard by which the greatness of nations was measured, was a part of the world...." (Ridgeway, pp. 124-125.)

The Creation of a World State Administered by the Elite

The international bankers and corporate directors of the Western World see the earth as one single economic unit. In their view there are no independent sovereign nations. They have, therefore, from the earliest times (17th century) attempted to design rules and regulations whereby the earth could be administered as single unit. These powerful groups of men whom we call the financial combines of the world have been working steadily to bring to pass "a single world economy" in every conceivable area – finance, production, distribution, transportation, communications, education, etc. From an administrative point of view it is easier to "rule" the world if it is one unit and they control the financial system, the trade system, the production system, etc. If one understands their viewpoint and their goals, then their speeches, papers, policy recommendations, etc., which are designed to guide the nations of the earth in "one set of systems," make sense. If one looks at the financial, trade and economic history of the world for the last two hundred years it would be impossible to escape this conclusion. The facts demonstrate that their goal is a "new Imperial Order" or world state administered by elite technocrats whom they carefully select which will implement policies which have been carefully designed to maintain a system of total power in private hands.

Reducing the Nations of the World to Mere Administrative Units

The international bankers and businessmen have selected and support financially a multitude of philosophies and organizations which are designed after a period of global crises to destroy the political and economic sovereignty of every nation and reduce the populations thereof to a carefully indoctrinated status. That is why this powerful group of men support communism and such nations as China and the former Soviet Union. The USSR pushed the world by "force" into "a single economic unit" while socialist nations in the Western world are guiding the people into "single economic unit." International institutions designed and controlled by the financial combines of the world have been established to rule or "administer" the globe when total political and economic sovereignty has been transferred to them. The nations of the world will then become administrative units of a world state. This is the long-range goal of the financial combines, whether it will be achieved or not remains to be seen. Knowing "the plan" helps the observer

understand the "game of power and gain," regardless of who is on the playing field.

The Unique Global Perspective of the Elite

Professor Ridgeway, like Professor Carroll Quigley, has provided the reader with a rare glimpse into the real world of high finance and business.

The work of the London conference gives one an insight into the unique global perspective held by the leading businessmen and bankers of the Western world. The conference was divided into five groups: finance, production, distribution, transportation and communications, and devastated regions. Professor Ridgeway notes:

"...The wide range covered by the agenda of the conference carried the action of international business initiated at Paris still farther into the realm of normal peacetime affairs. The Production Group brought into the discussions of the conference the subject of raw materials, statistics, fuel economy, standardization, industrial and commercial liberty, general industrial problems, and construction. The Distribution Group took up the questions of commercial arbitration, the international protection of industrial property, the treatment of commercial travelers, unification of tariff nomenclature, import and export tariffs, embargoes on imports and exports, emigration and immigration, and calendar reform. The Transportation and Communications Group considered the work of the Barcelona conference and general transport communication problems, such as through freight trains, telegraph and telephone facilities, uniformity of ship's tonnage measurement, single bills of lading for combined transport to rail and sea, uniform international ocean bill of lading, dangerous merchandise, trade terms, port conditions and changes, free zones in sea ports, international postal service, and passports and visas. And the Finance Group carried forward the work on double taxations, export credits, control and regulation of business by the state, finishing credits, foreign banks, and bills of exchange. The debates upon these subjects and the resolutions adopted marked another stage in the international discussion of these questions...." (Ridgeway, p. 125.)

Economic Disarmament of the World

Part III of Professor Ridgeway's book is entitled, "Economic Disarmament." The first chapter of this section deals with "The Evolution of International Tariff Policy." In this chapter he notes that it was not necessary to have an orchestrated effort to reduce tariff barriers because there was already a control mechanism in place which guaranteed free trade and it was located in London. Professor Ridgeway exclaims:

"...The evolution of international trade policy was predetermined by the political-economic factors which followed in the wake of the financial

reconstruction of the European national state system. An international tariff policy was not formulated during this period for the same reason that a revival of Codenism did not menace neo-mercantilism prior to 1914. National barriers failed to cut the main arteries of trade. Before the World War factors adverse in the world currents of trade were constantly liquidated through British financial control and European imperialistic expansion. Had anyone of the close Continental tariff systems become powerful enough to dispute financial control with the great London market, this process of liquidation might have been interrupted and the main currents of international trade, unsupported by British credit policy, reduced to a mere trickle over national tariff walls. Similarly, after the war, uneconomic national divisions of production and distribution, marked off by the maze of postwar European tariff walls, were at first scarcely discernible against the postwar background of political hatred. They were later submerged in the flood tide of American goods and credits which swept in from the West upon the acceptance by European governments of the war debt settlements, the reestablishment of the gold standard, and the execution of plans for financial reconstruction under the League and Dawes regimes. Later, when a reconstructed European industrial system attempted to ship its cargoes of products in repayment, the American tariff wall loomed up out of the welter of American prosperity. The high American tariff stopped European repayment through the normal working of international trade and thrust back European goods into the restricted channels of the postwar European tariff system. The threatened blockade of European-American trade turned American and European thought to the possibility of opening other routes and other markets to free competition within the confines of Europe itself, thereby staving off the impending American credit-tariff blockade.

Paving the Way for International Trade

"The movement to hew a way for international trade straight through the economic armaments of Europe followed numerous minor attempts by international conferences to secure freer trade by the limitations of various forms of political blockade. The objectives of these preliminary campaigns, however, were limited to the conception laid down at Paris by the advocates of liberal trade policy, namely, the elimination of discrimination and retaliation from the various phases of commercial policy. In general, as has been pointed out, this movement for the elimination of war practices from economic policy ran parallel to the kindred movement for the ending of coercive practices in financial policy. Because of its limited character, however, and its necessary dependence upon success in the financial field, the formation of trade policy before 1925 never claimed more than secondary public interest. The accomplishment, whoever, of collective action in this field not only reinforced international cooperation in the financial sphere and aided in developing the system of cooperative action between the business men of the I.C.C. and the machinery of the League, as noted above, but cleared the ground for the great business movement of 1927 against the tariff system. While the League's Disarmament Section and the Temporary Mixed Committee were

breaking technical ground in the field of national security in an effort to initiate a general movement towards military disarmament in fulfillment of President Wilson's fourth point, the Economic Committee and the Economic section of the Secretariat, together with the International Chamber of Commerce, were breaking similar ground, preparatory to a general advance into the territory of nationalism preempted by President Wilson's third point, dealing with economic disarmament...." (Ridgeway, pp. 199-200.)

The Thrust for Tariff Reductions

It should be pointed out that it was the directors of the large international companies who favored free trade and were to launch in the 1920s a major effort to reduce tariff barriers. Small industrial concerns favored tariffs as a means of protecting themselves against unfair trade practices and government subsidies. The major thrust for tariff reductions came from Europe. Professor Ridgeway stated:

"Throughout the period of early postwar European reconstruction, terminating in the financial settlements embodied in the Austrian and Hungarian reconstruction plans and the Dawes plan, the need for some sort of a world conference, dealing with economic problems as a distinct from purely financial problems, was recognized by leading authorities in Europe and America. Such a conference, however, was considered inopportune before financial reconstruction had been set in motion...." (Ridgeway, p. 217.)

The World Economic Conference

This statement reveals where the real power of the world lies. The first thing to be readjusted after the war was "financial." The global banking fraternity first put its house in order and then set about to make other necessary arrangements for reconstruction of the world in such areas as trade and commerce. The time was ripe for an economic conference to move against tariffs. That conference was held in Geneva on May 4, 1927, and was called the "World Economic Conference."

The Long-Range Goal to Lower All Tariff Barriers

The main emphasis of this conference was to lower tariff walls in Europe, however, the long-range goal which was announced was to lower all trade barriers throughout the world.

In preparation for the conference the I.C.C. undertook extensive preparation. Professor Ridgeway noted:

"...The document which finally emerged from the Chamber's protracted and intensive process of international discussion was at length placed before the World Economic Conference under the title of Final Report of the Trade Carriers Committee of the I.C.C. (C.E.I.). The work of the committee was remarkable both

for the world-wide breadth of the opinion represented and for the definiteness of its recommendations....

"The great importance attached by the League [of Nations] secretariat to the report of the Trade Barriers Committee, however, lay not only in the intrinsic merit of the document as embodying the work of business experts from many nations, but also in the significance of the great business movement against trade barriers which it represented. The report was the charter of one of the most interesting and inspiring international movements since the war. There had been numerous attempts before the war by various interested organizations to mitigate the evils of custom procedure, and the I.C.C. had given definite form and a considerable measure of success to these attempts in its cooperative effort with the League [of Nations] which produced the Convention on Custom Formalities in 1923. These attempts, however, failed to win the enthusiasm of the business world. Since the days of the free-trade leadership of Manchester, there had been no such stirrings in the business world as that which centered in the new business international at Paris. Under the leadership of one of the City of London's most eminent financiers, Walter Leaf, world-wide discontent with the existing era of tariff strife was turned into a campaign for free trade. The campaign was vigorously waged by the president, the council, and the secretariat from the international headquarters of the Chamber and by the various national committees. In address after address, Leaf gave a decisive lead to a direct attack on the whole tariff system....

"The report of the Trade Barriers Committee, like the Dawes plan, carried behind it the overwhelming support of the business world....

"The clear-cut stand in the conference by the I.C.C....led to world opinion demanding governmental action in the direction of a downward movement of tariff....

"The world Economic Conference of 1927 saw some of the spokesmen for international labor and world business opinion united in a demand for economic disarmament.... (Ridgeway, pp. 229, 232, 235, 237, 244.)

The Time Has Come to Remove Tariff Barriers

Professor Ridgeway notes that the conference accepted a report which ended with this last clause:

"The conference declares that the time has come to put an end to the increase in tariffs and to move in the opposite direction." (Ridgeway, p. 246.)

Professor Ridgeway summarized the 1927 conference as follows:

"The conference declares that the time has come to put an end to the increase in tariffs and to move in the opposite direction.

"The unanimous adoption by the conference of this proposal for immediate government action in the direction of economic disarmament was a great triumph for the world business movement represented by the Trade Barriers report of the I.C.C. The World Economic Conference thereby gave force and direction to the campaign of world business for "a complete change," to quote the words of the Trade Barriers report, in the tendencies of existing tariff opinion. The conference recommended that immediate action be taken along three lines, viz:

1. Individual action by states with regard to their own tariffs.
2. Collective action through the conclusion of suitable commercial treaties.
3. Bilateral action, by means of an inquiry with a view to encouraging the expansion of international trade on an equitable basis by removing or lowering the barriers to international trade which are set up by excessive customs tariffs.

"The conference further endorsed "the unconditional most-favored-nation clause in its broadest and most liberal form" and recommended that the League of Nations "consider the possibility of establishing clear and uniform principles in regard to that clause and introducing common rules relating to commercial treaties...."

"Thus, the entire emphasis of the World Economic Conference of 1927 was placed upon the necessity of a major offensive against all barriers to international trade...." (Ridgeway, pp. 236-248.)

The Movement for Economic Disarmament

The last chapter of Professor Ridgeway's section on economic disarmament is entitled, "The Years of Commercial Treaties." He begins by stating:

"If the World Economic Conference had placed the weight of the League of Nations behind the movement for economic disarmament, it had also clearly revealed the obstacles which lay in the path of progress. International leaders now turned to the I.C.C. meeting at Stockholm for the world-wide business support necessary to carry the "Geneva program through governments...." (Ridgeway, p. 250.)

The Largest Business Conference in History

The Stockholm meeting was a success, at least for the internationalists. Professor Ridgeway noted:

"...The gathering at Stockholm in 1927 was the largest and most representative business conference which history had seen. In addition to the representatives of the various national chambers of commerce, it included the representatives of 928

of the most important economic associations in the world and 2,130 great firms and corporations. The influence of this world economic parliament was considered by League [of Nations] economic leaders a decisive factor in the struggle for economic disarmament...." (Ridgeway, p. 250.)

The Formidable Forces of Nationalism

The forces of internationalism gathered at Stockholm underestimated the power and forces of economic nationalism. Professor Ridgeway comments: "...National economic pressure groups barred government action by the United States and France...." (Ridgeway, p. 253.)

Economic Nationalism was Deeply Entrenched

Europe had been blanketed with commercial treaties designed to lower tariff barriers, however, economic nationalism was more entrenched than the internationalists believed. Professor Ridgeway records:

"...The causes for the slowing up and checking of the tariff reform movement and the fateful return to economic nationalism are clearly sketched by Sir Arthur Salter in a memorandum privately circulated among interested League circles on September 2, 1929, the eve of Briand's appeal in the Assembly for a "United States of Europe." The conference's tariff offensive, in the view of Sir Arthur, was being defeated by "those private interests" which had developed business under the shelter of trade barriers. Sir Arthur wrote:

"These private interests are better organized, more vocal, and more politically effective, than the general public interests on the other side; and are much more conscious of what they would stand to lose than the other business interests (such as exporting industries) of what they would gain. Exporters and industries which would certainly gain by a reduction in tariff, even those of their own country, have been disappointingly indifferent when their support might have been decisive.'

"With this failure of business support Sir Arthur associated the deteriorating influence of American tariff policy, at that time in its final stages of formation. The influence of American tariff policy was particularly noteworthy, as was pointed out in the second report of the Economic Consultative Committee, through the implicit American threat to low-tariff countries by the operation of the most-favored-national clause. The ultimate extent of the disastrous influence of the Hawley-Smoot tariff act, finally adopted by the United States in 1930, is clearly indicated in any study of the subsequent era of tariff retaliation...." (Ridgeway, pp. 258-259.)

The Hawley-Smoot Tariff Act was Designed to Protect America

The free trade bias of Professor Ridgeway surfaced in the above quote. The Hawley-Smoot Tariff Act of 1930 was passed by Congress because certain key

congressmen knew that the internationalists were bent on dominating America's industry and bring it under international surveillance and rules. The tariffs were raised to protect America's industrial base. Professor Ridgeway concludes his chapter with these words:

"...The failure of American and European business leadership to carry through successfully the combined League and I.C.C. tariff offensive points to the inadequacy of national political machinery. The voices of a reasonable national policy were lost in the clamor of the chaotic legislative lobby of which the American Hawley-Smoot tariff lobby was the most notorious. The same glaring defect in national political organization was also to prove largely responsible for the failure of governments – the American government in particular – to work out a series of progressive solutions in the financial field of reparations and war debts. The early financial reconstruction of Europe was not a definitive settlement but rather the first step in a progressive liquidation of outstanding war costs. The eventual financial collapse was the result of the inability of the national state to formulate successfully a reasonable policy of change.

"The I.C.C. was incapable of following out these problems through the details of a final settlement, but the organization of business opinion was effective in providing the impetus which aided in placing these problems at crucial moments in the hands of experts largely drawn from the ranks of its own leadership.

"Five years later the United States embarked upon a program of reform in tariff making which represented a belated attempt to apply to the formation of national economic policy the technique of economic cooperation evolved in the international field. The methods adopted by the American Department of State in the formation of the Hull tariff policy mark the substitution of orderly planning for the functioning of the notorious tariff lobby. Those export interests, whose lack of influence in tariff making Sir Arthur Salter regretted in 1929, were in 1934 at last granted the right of a full hearing in Washington...." (Ridgeway, p. 259.)

The Forces of Internationalism Capture the Executive Branch and the Judicial Branch

From the above quote it is obvious that the internationalists had come to the conclusion that national governments must be controlled and utilized to promote policies conducive to the construction of a global system of governance. In the United States the internationalists have been successful, but not without a tremendous effort. After engineering a depression to undermine economic nationalism and sovereignty in America, the internationalists were able to place one of their trusted colleagues in the White House. Subsequently, Roosevelt socialized the United States through the New Deal. In 1934, Congress passed the Trade Agreements Act which transferred from Congress to the Executive Branch control over foreign commerce. Tariffs began to steadily decline to their present,

almost non-existent state today. In 1930, the forces of internationalism succeeded in capturing the Executive Branch of government. Two decades later, the Judicial Branch had also fallen under their power. During this time many influential Congressmen also abandoned their constituents and the principles upon which America was based and supported the internationalist viewpoint. From 1934 until the present, America has witnessed the steady growth of government and the relinquishment of political and economic sovereignty to international bodies.

Securing Coordinated Effort at the International Level

Part IV of Professor Ridgeway's book is entitled, "The Diplomacy of Technics." In a chapter of this section entitled, "The Business of the International Chambers of Commerce," he states:

"...As stated in its constitution:

"The International Chamber is organized

"To ascertain and to express the considered judgment of those interested in international business;

"To secure effective and consistent action both in improving the conditions of business between nations, and in applying solutions for international economic problems;

"To encourage intercourse and better understanding between businessmen and business organizations of the various countries;

"And thereby to promote peace and cordial relations among nations.'

"The performance of these services in the world economy of business has necessitated the development of technical services in the orbit of international organization is shown by the achievements of the I.C.C. in smoothing the operation of the machinery of international business. This unspectacular but constructive everyday work of experts has, as we have observed, often given a decisive impetus to work in the field of general policy. It has been in the sphere of technical cooperation that the trends of scientific progress, when permitted work, have induced a new and more dynamic motivation for constructive change opposite to the inertia of provincial politics. In this sense, the tedious routine activities of the international headquarters of the I.C.C. deserve to be considered along with the activities of the technical sections of the League of Nations, the International Labor Office, and the International Institute of Agriculture, as one of the forces affecting the evolution of international relations. By eliminating the causes for friction at the source, the architects of technical cooperation in many instances have contributed the foundation for the structure of international agreement. On the other hand, technical cooperation is often achieved only under the pressure of events operating

in the sphere of general policy. The two spheres are constantly interacting in such a way as to make apparent the united of the whole progress...." (Ridgeway, p. 264.)

The Evolution of a World Economic Society

In a chapter entitled, "Double Taxation," Professor Ridgeway admits that the I.C.C. has aided in the evolution of a "world economic society," where the significance of the nation-state is eventually reduced to the status of an administrative unit. A world economic society is also a forerunner to a global political system. Professor Ridgeway notes:

"The power to tax is the power to destroy – the most absolute of the attributes of the sovereign state. There is no more positive evidence of the evolution of a world economic society than the steady encroachment upon this domain of national politics by the rapidly spreading network of international treaties curbing the power of the national state to tax various forms of international commerce. In the development of this most significant regime of international control, the I.C.C., through its committee on double taxation headed by the prominent Swiss banker and international authority on taxation, Robert Juilliard, has played a dominant role in cooperation with the League of Nations. In no enterprise have the League and the I.C.C. cooperated more closely than in the slow and tedious work of erecting a system of bilateral treaties on double taxation looking toward eventual international control through a multilateral treaty. The League, in attempting to coordinate governmental policy, has made full use of the I.C.C. machinery of unofficial business consultation and policy-forming on an international scale. The League of Nations has always been represented at the meetings of the I.C.C. committee on double taxation, and an official I.C.C. representative has participated in the work of the League experts. And League investigations have, in certain important instances, been conducted through the organization of the I.C.C.

"The development of an international economic society has been greatly accelerated since the war by the spread of foreign investments and the extension of industrial enterprises through international organization across national frontier. At the same time there has been a universal shift in emphasis in the method of taxation from real property to income with consequent tightening of national surveillance of the books of private business. The increase in the international character of taxable property on the one hand, and the increase in the stringency of national taxation on the other, have combined to make taxation an international problem of the greatest moment. The national income tax has made liable for taxation the total income of persons within the jurisdiction of the taxing power, whether that income be derived from property situated outside the jurisdiction or not. On the other hand, income derivable from productive enterprises has commonly been taxable at the source, no matter whether its destination be outside the jurisdiction of the taxing power or not. The general extension of the national taxing power has made conflict between jurisdictions inevitable. The business man

who ventured across frontiers on distant enterprise has found his ways hunted down by a multitude of tax collectors whose exactions were not confined to customs examinations...." (Ridgeway, pp. 279-280.)

The Erection of a Unified International Regime

Between 1920 and 1930 the League of Nations and the I.C.C. cooperated together toward "the erection of a unified international regime outlawing double taxation." (Ridgeway, p. 283.)

The Foundation of a World State Is In Place

Perhaps the reader has begun to grasp the magnitude of difficulties one confronts in building a global economic and political system, the number of organizations world-wide that are necessary to bring it about and the degree of cooperation needed. The postwar planners, as noted before, have attempted to unify the following systems at the international level: finance, industry and production, distribution, transportation, communications, education, labor, etc. Although it has taken decades to develop, the foundation is laid today and all that remains is for the outer walls to be erected and an additional structural support or two. Presently there are over 200 international organizations which in one way or another knowingly or unknowingly are promoting the construction of a global system of governance where the influence of the nation will become practically non-existent. This day does not seem far away.

The Persistent Effort to Build a World State

Although world economic and political planning may elude the citizens of the world, it has been on the minds of certain people – the international bankers and international businessmen for decades. Professor Ridgeway demonstrates the truthfulness of these assertions as follows:

"...It was the constant objective of the economic liberals of the League, of the I.L.O. and of the I.C.C. to organize a world opinion through the actual operation of the Geneva parliamentary system which would insure the eventual submission of great economic and financial issues to a parliamentary settlement. It was hoped that the crucial issues raised by reparations, war debts, and military and economic armaments would at least be assimilated to the expanding regime of practical "gas and water" internationalism, represented by the parliamentary processes of peaceful change successfully functioning in the diplomacy of technics and the reconstruction of Europe.

"The extension of such a reasonable policy of change was the constant aim of world economic planning within the organization of the International Chamber of Commerce and the League of Nations...." (Ridgeway, p. 336.)

The Forces of Internationalism Battle the Forces of Nationalism

Today, the forces of economic internationalism are arranged against the forces of economic nationalism. Hundreds of organizations at the national and international level are promoting the doctrines of internationalism and laying the groundwork for the "new Imperial System."

Visualizing the World As One Economic Unit

In a chapter entitled, "The Breakdown: A Proposal for Economic Peace and Its Rejection," Professor Ridgeway reported on an I.C.C. meeting in London (June 1933) where the businessmen were admonished "to visualize the world as one economic unit." (Ridgeway, p. 364.) Conference participants were also encouraged to "check the present drift toward...intransigent economic nationalism...." (Ridgeway, p. 364.)

The Instruments for Economic Harmonization and Coordination

The global planners, as noted before, look at the world as one unit. Professor Ridgeway explained the international philosophy of the I.C.C. and its businessmen in a chapter entitled, "The Breakdown." He called the global system the "Geneva System" because of the technical instruments for economic harmonization and coordination which are located there.

"...The Geneva system of internationalism [was] based upon the techniques of international policy-making and international action.... [It] was exemplified at the World Economic Conference of 1927 and in the Dawes and Young Committees by the inter-penetration of extranational and extragovernmental forces, such as the I.L.O., the I.C.C., and the International Institute of Agriculture...." (Ridgeway, p. 372.)

Economic Nationalism Surfaces in U.S. and Europe

In 1933 economic and political nationalism surfaced not only in the United States but in Europe. Economic nationalists had temporarily gained the upper hand causing strife to enter the arena of planned international cooperation. In other words, the postwar plans of the internationalists had been frustrated for the moment. The global planners had found that the nation-state, although severely wounded, was not dead. It was slowly recovering from the war and the economic chaos of the 1920s. It would take another war and the establishment of the United Nations system before the nation-state would be placed on the critically wounded list. "The world of 1933," however, according to Professor Ridgeway, "was a very nationalist world." (Ridgeway, p. 388.)

An Attack on Sovereignty and the Nation-State

Professor Ridgeway concludes the last chapter of his monumental escapade of the activities of the international bankers and businessmen with an attack on the concept of national sovereignty and the nation-state. He calls for a new form of nationalism where nation-states are reduced to administrative units in a global political system. He talks of international political parties, international institutions with the power of decision-making and a new world society dominated by an alliance of government and business. Professor Ridgeway concludes his essay by giving the classical argument for corporate socialism at the international level. After all, Professor Ridgeway feels that "the hope for escape" from the world of political and economic sovereignty lives in the planning of the bankers and the businessmen. The goal of the international players described by Professor Ridgeway is the "creation of" a world system of financial control in private hands able to dominate the political system of each country and the economy of the world as a whole." (Quigley, p. 324.)

A World State by the 20th Century

Professor Ridgeway argued that:

"...The nation-state system has tended to dominate the social activities of mankind. Other institutions – the church, the university, the hospital, the business corporation, agriculture, organized labor, the local community – have by material circumstances been forced into the shadow of this galaxy of omnipotent, all-inclusive national corporations, sovereign states, which have arrogated to themselves complete independence of action subject to no law but their own. But now material circumstances have changed. Will the world neighborhood created by the twentieth century, covered by a network of institutional activities which cut across all boundaries, remain passive while its entire civilization is menaced in the name of national interest? Are we to share the fate of Hellenic civilization? The hope for escape today can at least be justified in part by the strength of nonpolitical institutions of the kind described in these pages.

The Principles of International Cooperation

"The fundamental principles and the necessary devices to make effective these principles lie before us today in the constructive achievements of liberal internationalism accomplished during the postwar period of trial and error at Geneva. The principles and technique of international cooperation are embodied in Central and Eastern European reconstruction, the Dawes plan, central bank cooperation, the World Court, the I.C.C. world business court of commercial arbitration, the host of ratified and unratified draft labor conventions promulgated by thorough investigation and international consultation at the I.L.O., and the myriad of draft conventions and constructive but politically unacceptable recommendations from the finance, economic, and transit sections of the League of

Nations, the International Institute of Agriculture, and the I.C.C. This practical work by international institutions is strong enough to stand unsupported by armaments on the basis of common interest and merit alone. The effectiveness of this work designed for healing the distress of the world has been prevented by a single destructive institution – the sovereign as distinguished from the welfare state. From the national side, the problem resolves itself into the question: can sovereignty be curbed by liberal international institutions? Can acts of sovereignty be qualified by provision to substitute international cooperation in such a way as to bring into play the healing function of liberal institutions? Or, viewing the problem from the international standpoint, can a world parliamentary system be made to work? Is it possible to adapt the parliamentary system to modern international conditions?

International Opinion-Making Forces

"Within the area of national sovereignty the motive force of parliamentary action springs from opinion-forming institutions which give a tangible social expression to individual thought and emotion. This philosophy, as we have seen, League leaders attempted to apply at Geneva in the recognition accorded to unofficial representatives and organizations at League expert conferences. The device has been extended to executive conferences in the field of technical cooperation, in particular in the recognition of the I.C.C. It was attended with marked success, as we have seen, at the International Customs Conference in 1923, the chairman of the I.C.C. delegation, Clementel, presiding over one of the two conference committees and the I.C.C. delegates actually signing this formal convention with the representatives of sovereign states. In the field of major economic policy, however, this device has never been tried. The same principle, to all intents and purposes, was applied, as noted above, by the Allied powers in the appointment of committees of business men to draft the reparations settlements. At the only attempt at a world economic conference of an executive type, this well-established and successful League technique, however, was abandoned. The only nongovernmental institution permitted representation at the London World Economic Conference was the Bank for International Settlements which, however representative of world financial and economic life it may be, can scarcely be called an opinion-forming organization. The world of 1933 was a very nationalistic world. International opinion-forming organizations like the I.C.C. would certainly have encountered formidable opposition from government officials had they been admitted to the London conference. The Vienna plan, for example, of the I.C.C. might well not have resulted in a London plan in 1933 as the Rome plan eventuated in the Dawes plan ten years previously.

The International Economic Reform Movement

"There were present, however, in 1933, the elements of a considerable international economic reform movement. Had the London conference been a

representative assembly of the familiar national parliamentary type these elements would certainly have made themselves felt in the usual type of national party debate. Issues would not have been left in segments of provincial interest. The issues would have been clearly defined in terms of large national policy for the final decision of the general public within the whole area of the parliamentary regime. It was too much to expect government officials necessarily limited by precise terms of reference to divide along lines of essentially international rather than national policy. Such a parliamentary division would presuppose national officials to be members of active international opinion-forming political parties, cutting across national frontiers. It would presuppose, in fact, the familiar parliamentary type of political machine built along international lines.

The Beginnings of an International Alignment on Issues

"The national party has, in fact, provided the answer raised by similar problems involved in the extension of the parliamentary regime to the federal form of an interstate government such as the United States. The conditions for the formation of national parties in the several sovereign states of the American federal union, however, have been much more favorable than are conditions in the contemporary world for the formation of international parties of the usual parliamentary type functioning within the legal framework of the representative system. But the beginnings of an international alignment on issues of international significance can be clearly seen in the functioning of international opinion-forming organizations within a limited section of the Geneva system. The techniques of action developed by the I.C.C. in twenty years of close cooperation with official internationalism represent definite progress in the direction of such a new international alignment of opinion.

The Need for a World Economic Parliament

"The history of the League system justifies the assumption that, were the economic organization of the League of Nations enlarged along lines which would provide for a continuously functioning world economic parliament including a considerable section of nonvoting representatives of international organizations, a realignment of opinion in world parliamentary patterns would be greatly accelerated. Had international institutions in the crisis of 1931 been able to set in motion machinery through active participation in a world economic parliament, issues might have been formulated along international lines and an international leadership might have been asserted. Such a united front against economic nationalism at Geneva might, for example, have coordinated various national reform movements. Objections to "A Second Peace Conference" in 1931 might have been overcome by desperate pressure on Tardieu from an aroused world reform movement centered on a Geneva parliamentary struggle. Or had such an international alignment been possible a year later, American interest in supporting

Herriot against his own nationalists with an approach on the debt question might have been made apparent.

International Legal System

"The League, were such a procedure adopted, would have the means of bringing these international institutions into a legal system of an international character in the articles of regulation providing for the representation of such organizations. In this manner an international party system of a unique character could be introduced into the machinery of official international consultation and action. Inasmuch as international conferences do not function on the principle of parliamentary majorities but rather on the principle of attaining the maximum of agreement between sovereign states, the presence of a considerable body of nonvoting delegates would lead to no confusion. It should give ground for no valid objection. It is a matter of international record that government delegates at international conferences in which the I.C.C. has been represented have found these unofficial delegates to be of the greatest service in the work of the conference.

An International Party System

"The establishment of such an international party system would not only make possible, quite apart from the vicissitudes of party politics, the continuous participation of distinguished leaders of opinion in actual international negotiations. It would also tend to popularize enormously the League of Nations among the masses. The great advantages offered by direct participation in the debates and committee work of executive international conferences would undoubtedly inspire nationalist sentiment to seek international organization for its direct expression. Such a procedure would put a definite premium upon the formulation of national policy in terms of international interest. Thus national sovereignty, like state sovereignty in the United States, might be expected ultimately to express itself in terms of 'states' rights.' International institutions, if actively participating in such a collective system, would also be in a better position to exert influence in national legislatures in support of international policy. This has been done, in fact, very effectively by the I.C.C. in the case of Congressional hearings on the Hull tariff policy.

A Reorganized World Economic System

"In such a reorganized world economic system, international institutions would be impelled to turn from vague declarations to the practical demonstration of the profits to be derived from and the services to be rendered by collective internationalism. We need an international improvement association formed along the lines of a village or neighborhood improvement association, determined and powerful enough to force a liberal reform program in the sphere of international politics, as its local prototype has done in the sphere of local politics. The

international armaments machine will be found as vulnerable to this type of concerted attack by a united liberal front as have local political machines in the sphere of local reform.

The Task of Enlightened International Statesmen

"There is a legitimate profit interest in international cooperation held by the church, the arts, the sciences, business, agriculture, and labor – by all who live by the works of peace. It is the task of enlightened statesmanship to make this interest apparent to individuals and to enable individuals to act collectively in defense of their collective interests in international peace.

The New Techniques of International Cooperation

"The new techniques of international cooperation deserve precise application in the field of national legislation. In every national statute calling for the use of independent national sovereignty there should be inserted an escape clause drawn along the lines provided by the business statesmen who drafted the Dawes plan, providing very definitely for escape from interstate conflict by all possible measures of international cooperation. This principle should be written not only into matters of immediate dispute; it must be written into the texts of all national laws which are in the broad sense of international concern, particularly those national laws regulating national military and economic armaments. In this respect the present American reciprocity tariff act is deserving of careful study.

The Need for a New Form of Nationalism

"Liberalism must impel the nation-state to face outward upon a world filled with international realities. Such a change of view will inspire a saner, a more realistic, a new nationalism. Nationalism has always worn its most romantic luster in that society of nations where common interests have become one in a cause, which, lifted above the interests of a single nation, has become the cause of humanity itself. The great world-wide voluntary institutions clustered about the church and the university represent causes which far transcend the horizons of any nation, race, creed, or class. They are the institutions which are set for the healing of the nations.

Developing a Society of Nations

"A new nationalism alert to cooperate in the common interests of the society of nations must be brought into being. Contemporary civilization requires a readjustment of relationships between the state and those institutions which carry the seeds of a new world society. In particular, present events demand that the politico-economic partnership between the state and business in the interest of private gain be dissolved. It is a partnership limited to no particular trade. All who take dividends from the control of markets or raw materials protected by arbitrarily

fixed national tariffs or regulations must assume responsibility as business partners of the military state. Economic nationalists are the real armament profiteers. This partnership has always been a partnership with debt. It has become a partnership with death.

The Evolution of a New Partnership Between Government and Business

"The evolution of a fair and equitable partnership between government and business conceived in terms of a broader world interest has been slowly taking shape in the twenty years of business diplomacy represented by the activity of the I.C.C. in international affairs. The statesmanship of those who have labored through the I.C.C. to overcome destructive postwar nationalism with the good sense and practical idealism of international business cooperation today offers the basis of a new association between business and government...." (Ridgeway, pp. 386-392.)

The Elite Use Taxpayers Money to Build Their Global System

The alliance of business and government is nothing more or less than the philosophy of corporate socialism. The elite financial oligarchy are using the taxpayers money to build their "new Imperial System." While they have become quite adept at redistributing taxpayers dollars, they conceal and protect their wealth in offshore trusts and giant tax-exempt foundations. The use of taxpayers funds to build the new international order is the greatest case of legal plundering in world history.

Part V The Development of a Central Management System

10. Trilateralism – Blueprint for Global Governance

One of the most influential planning groups in the world, from any point of view – economic, political or social – is under the direction of the Trilateral Commission of New York City, Paris and Tokyo. The Trilateral Commission is no ordinary federation of international leaders. Its members are among the most prominent economic and political leaders in the Western World. This relatively small assemblage of internationally-minded individuals proposes to construct a "new international economic order" – a "community of nations" – made up initially of the more advanced nations.

Trilateral Commission Gains National and International Prominence

The Trilateral Commission gained national prominence in 1976 when it became known that President Jimmy Carter and Vice-President Walter F. Mondale were members of its exclusive organization. Following the inauguration of Jimmy Carter, the Commission gained international eminence when the most important decision-making positions of the Executive Branch of the U.S. Government were filled by "Trilateralists". These positions and the appointees included: Lucy Wilson Benson, Under Secretary of State for Security Assistance; W. Michael Blumenthal, Secretary of the Treasury; Robert R. Bowie, Deputy Director of Intelligence for National Estimates; Harold Brown, Secretary of Defense; Zbigniew Brzezinski, Assistant to the President for National Security Affairs; Jimmy Carter, President of the United States; Warren Christopher, Deputy Secretary of State; Richard N. Cooper, Under Secretary of State for Economic Affairs; Richard N. Gardner, Ambassador to Italy; Richard Holbrooke, Assistant Secretary of State for East Asian and Pacific Affairs; Walter F. Mondale, Vice President of the United States; Elliot L. Richardson, Ambassador at Large with Responsibility for UN Law of the Sea Conference; Gerard C. Smith, Ambassador at Large for Non-Proliferation Matters; Anthony M. Solomon, Under Secretary of the Treasury for Monetary Affairs; Cyrus R. Vance, Secretary of State; Paul C. Warnke, Director, Arms Control and Disarmament Agency and Chief Disarmament Negotiator; Andrew Young, Ambassador to the United Nations. Temporary appointments also included two Trilateralists: Sol M. Linowitz, Co-Negotiator for Panama Canal Treaty; Henry D. Owen, Coordinator of U.S. Preparations for London Summit

Former Trilateral Members in Public Service in Europe

In addition to the nineteen members of the Trilateral Commission entering the U.S. Government at top levels, nine Commissioners assumed official positions in Europe: Raymond Barre, Prime Minister and Finance Minister, French Republic; Herbert Ehrenberg, Minister of Labor and Social Affairs, Federal Republic of

Germany; Marc Eyskens, Belgian State Secretary for Flemish Regional Economy; Jean-Philippe Lecat, Presidential Spokesman, French Republic; Evan Luard, Parliamentary Under Secretary of State for the British Foreign Office; Michael O'Kennedy, Foreign Minister of Ireland; Henri Simonet, Foreign Minister of Belgium; Thorvald Stoltenberg, Secretary of State, Norwegian Ministry of Foreign Affairs; Olaf Sund, Senator for Labor and Social Affairs, Land Government of Berlin.

The Ultimate Goal of Trilateralism

Early in 1976 Richard H. Ullman, Director of the 1980s Project for the Council on Foreign Relations, outlined the ultimate goals of Trilateralism in an article titled "Trilateralism: Partnership For What?":

"...The ultimate result (of Trilateralism), to quote Zbigniew Brzezinski, the former Director of the Trilateral Commission, would be a 'community of the developed nations'. The path to that community, he wrote in this journal three years ago, runs through intensive 'regular and ever more formal political consultation' and 'common political planning with regard to problems or areas of mutual interest' in order to achieve a 'shared political perspective among the governmental bodies of the three (trilateral) units'. Governor Carter used almost the same language in addressing the Foreign Policy Association last June." (*Foreign Affairs*, October 1976, Vol. 55, No. 1, p. 5.)

The Trilateral Approach to World Order

President Carter followed the "trilateral approach" for the construction of a new global community of nations during his administration.

Piecemeal Approach to World Order

According to trilateralism "effective international cooperation can often be improved if the issues can be kept separate – what we call piecemeal functionalism." ("Towards a Renovated International System," *Triangle Paper*, No. 14, New York: The Trilateral Commission, p. viii.)

The "new world order" or "community of nations," proposed by the Trilateral Commission is to proceed in a piecemeal fashion. In a speech given in Kyoto, Japan, on May 31, 1975, titled "Trilateral Relations in a Global Context," Zbigniew Brzezinski outlined this approach as follows:

"...Our own work in this Commission, it is increasingly clear, is that of developing sustained trilateral thought on the nature and character of the needed renovated international system. I believe we recognize that the situation today is in some ways like that prevailing in 1945, when creative men did shape a system which worked, with imperfections, but worked nonetheless, for thirty years. Today

we have to engage a larger number of nations and participants in this process. And therefore the question arises, what ought to be our priorities and how do we go about it?

Eventual Political and Philosophical Accommodation with the Communist States

"In this connection, let me say a word or two about the role of the communist states in this process. I think it is essential that they be engaged. We have to seek cooperation with the communist states, pointing eventually to a political and ultimately even philosophical accommodation with them. The differences that divide us are the products of 19th century thought, increasingly less relevant to the conditions of the 20th, not to speak of the 21st century. But at the same time, we have to be aware of realistic limits to the scope of possible cooperation with communist states at this time in history.

Need to Seek Cooperation Step-by-Step and Region-by-Region

"In my own view, neither they nor we are historically or philosophically prepared to engage jointly in a global architectural effort. We still have to seek cooperation step by step, functionally and regionally, as opportunity permits it.

"...The moment may be right for some joint American-Soviet arrangements in the Middle East. Certainly in SALT the strategic relationship is being codified by the United States and the Soviet Union. And there is room for much more trade with the communist states.

Trilateral Relations – First Priority in Large Architectural Design of the Future

"But when it comes to the large, immediate, architectural issues of the day, it seems to me that the first priority still is that of trilateral relations. It is here where the philosophical basis for mutual understanding, where the political preconditions for cooperation surely exist. It is clear, it seems to me, that here is the opportunity for real architecture and initiative. I thus see, in the emerging world, our three regions still representing the more cooperative, the more vital center. I would hope that because of this we would fashion new or additional procedures for more effective consultations, for the shaping of joint initiatives for the central and global problems of our times.

New Political Caucuses Needed to Integrate Trilateral Regions

"I would hope to see the emergence of new political caucuses spanning our trilateral regions in some existing international institutions. But I would argue that the focus of much of this must be on the fashioning of a more just and equitable world order.

The Renovated International System Will Require a Tremendous Process of Creation

"...A renovated international system will now require a process of creation – much longer, much more complex – a process in which prolonged negotiations will have to be engaged and developed. It will require a process which recognizes the need for global adjustment in wealth, while creating additional wealth....

Shaping an International System Which Embraces the Entire World

"...In 1945, existing democracies shaped an international system which has been particularly efficient and desirable from the standpoint of trilateral democracies. Today the challenge which we ought to welcome is to shape a system which embraces the entire global community, and our trilateral regions can find a special opportunity in moving towards that end." (*Dialogue*, Summer 1975, No. 7, pp. 12-13.)

Admittedly, the construction of a "community of nations" is a formidable task. However, the members of the Trilateral Commission are hopeful of success.

President Carter's Former Training in Trilateral Policies

It is important to note that Zbigniew Brzezinski and Richard N. Gardner, both strategists in Trilateral policies, were President Carter's foreign policy mentors. Leslie H. Gelb quotes a spokesman near Brzezinski as saying:

"'Zbig was the first guy in the community to pay attention to Carter, to take him seriously.... He spent time with Carter, talked to him, sent him his books and articles....' For the better part of three years, Brzezinski (along) with Professor Richard N. Gardner of Columbia, had Carter virtually to himself...." (*New York Times Magazine*, May 23, 1976, p. 50.)

Zbigniew Brzezinski reportedly described Carter as "educable" while David Rockefeller, the North American Chairman of the Commission, is said to have remarked that Carter would be an "ideal politician to build on."

Carter Administration Following Trilateral Plan in Foreign Relations

Shortly after Brzezinski became Assistant to the President for National Security Affairs he was asked the following questions: "You must be aware of criticism that the Carter Administration has no sense of direction in its foreign policy.... What is your answer to that?" Dr. Brzezinski responded by saying:

"I can answer that in several ways.

"First of all, pretty much everything the President has done in the field of foreign affairs since January is the product of a deliberate planning exercise, which he supervised immediately after the election. Almost every action we have taken – I would even say every action we've taken – was part of a plan for the first 90 days of the Administration, which were meant to culminate in the London Summit. And I believe that this plan was carried out very systematically. These were not haphazard actions.

U.S. Responsibility for Building a New World System

"It is our view that we are now at a stage in history in which the United States again has to undertake a creative process of building a new world system. This must take into account the cumulative effect of all of the changes that have occurred in the past 15 to 20 years: the appearance of a massive number of new states, the extraordinary rapid decolonization, the surfacing of new social and political aspirations, the doubling of the world's population.

New Era of American Creativity

Dr. Brzezinski was then asked: "Are you looking toward a new era of American leadership in the world?" He stated:

"It may be too sharp and potentially misleading to call it a new era of American leadership. But it certainly is a new era of American Creativity, based this time on the need for a much greater degree of collaboration with others than was the case between '45 and '50 – when we were similarly engaged in a creative international effort." (*U.S. News and World Report*, May 30, 1977, p. 35.)

President Carter Praises Trilateral Commission

Early in 1976 Jimmy Carter praised the Commission for having provided him with a "splendid learning opportunity":

"In order to insure the continuing opportunity for penetrating analyses of complicated, important, and timely foreign policy questions, there is in operation an organization known as the Trilateral Commission – a group of leaders from the three democratic developed areas of current interest to Japan, North America and Europe. Subjects like the world monetary system, economic relations between rich and poor nations, world trade, energy, the future of the seas, aid to less developed countries, and other possibilities for international understanding and cooperation are first studied by scholars, then debated by members of the commission, and finally analyses are published and distributed to world leaders. Membership on this commission has provided me with a splendid learning opportunity, and many of the other members have helped me in my study of foreign affairs." (Jimmy Carter, *Why Not the Best?*, Nashville, Tennessee: Broadman Press, 1975, p. 127.)

Early Development of the Commission

It is appropriate to ask why the Trilateral Commission was initiated. In order to find the answer to this question we can consult the first Director of the Commission – Zbigniew Brzezinski.

Dr. Zbigniew Brzezinski outlined the concept of "trilateralism" when he published *Between Two Ages – America's Role in the Technetronic Era* (New York: Penguin Books, 1970).

Concerning this book, *The Nation* magazine stated, "The book's manifest function is to open a Great Debate, wide ranging and touching upon the ultimate questions about society and human nature." *Foreign Affairs* stated: "This is one of the most original books on political and social thought to appear in recent years."

A Proposal for a Community of Nations Outlined by Brzezinski

In the section of his book entitled "A Community of Nations," Dr. Brzezinski outlines the future program of trilateralism in detail. He stated:

"A community of the developed nations must eventually be formed if the world is to respond effectively to the increasingly serious crisis that in different ways now threatens both the advanced world and the Third World. Persistent divisions among the developed states, particularly those based on outmoded ideological concepts, will negate the efforts of individual states to aid the Third World; in the more advanced world they could even contribute to a resurgence of nationalism.

The Gradual Evolution of a New International System

"From an American standpoint, the more important and promising changes in the years to come will have to involve Western Europe and Japan. The ability of these areas to continue to grow economically and to maintain relatively democratic political forms will more crucially affect the gradual evolution of a new international system than will likely changes in American-Soviet relations. Western Europe and Japan offer greater possibilities for initiatives designed to weave a new fabric of international relations, and because, like America, they are in the forefront of scientific and technological innovation, they represent the most vital regions of the globe.

Western Europe is Already a Single Entity

"Though some scholars emphasize the vitality of European nationalism, the broad thrust of Western European development is toward increasing cooperation and – much more important – toward a European consciousness. For the younger Europeans, Western Europe is already an entity in all but the political respect: though still anachronistically governed by a series of provincial chieftains

(occasionally visited seriatim by the foreign potentate from Washington), their Europe is frontierless, open to unlimited tourism, to the almost unlimited movement of goods, and increasingly to the flow of students and workers. To be sure, a positive regionalism is yet to mature, but the foregoing at least provides the needed psychological basis for a new Europe. The technetronic revolution has accelerated the appearance of this Europe, and the autarkic ideas of the industrial age have little or no hold on it today.

The Impact of Science and Technology on Japan and Europe

"In Europe the impact of science and technology, though disruptive within some societies (particularly Italy, which is just completing the industrial phase of its development), has inspired increased cooperation; in Japan, however, which lacks the immediate external outlet that European unification provides for the Western Europeans and which is subject to a highly visible American military-political presence, it has had an internally aggravating effect. It tends to sharpen the nation's internal political conflicts, polarizing public opinion and rendering the future orientation of the country uncertain. The conflicts between generations evident in most of the advanced world have special gravity in Japan, given the cultural upheaval produced by its defeat in World War II and the only recently achieved balance between its traditions and modern democratic institutions. A revival of Japanese nationalism or a turn toward ideological radicalism would seriously threaten the highly tenuous structure of peace in the Pacific and directly affect the interests of the United States, the Soviet Union, and China.

An Effort to Forge a Global Community

"Accordingly, an effort must be made to forge a community of the developed nations that would embrace the Atlantic states, the more advanced European communist states, and Japan. These nations need not – and for a very long time could not – form a homogeneous community resembling EEC or the once hoped for Atlantic community. Nonetheless, progress in that direction would help to terminate the civil war that has dominated international politics among the developed nations for the last hundred and fifty years.

The Absence of a Unifying Process Between Democratic and Communist States

"Though the nationalist and ideological disputes among these nations have less and less relevance to mankind's real problems, their persistence has precluded a constructive response to dilemmas that both democratic and communist states increasingly recognize as being the key issues of our times. The absence of a unifying process of involvement has kept old disputes alive and has obscured the purposes of statesmanship.

The Creation of a Global community is the Major Task of the Next Decade

"To postulate the need for such a community and to define its creation as the coming decade's major task is not utopianism.

Deliberate Efforts to Accelerate the Process of International Cooperation

"Under the pressures of economics, science, and technology, mankind is moving steadily toward large-scale cooperation. Despite periodic reverses, all human history clearly indicates progress in that direction. The question is whether a spontaneous movement will suffice to counterbalance the dangers already noted. And since the answer is probably no, it follows that a realistic response calls for deliberate efforts to accelerate the process of international cooperation among the advanced nations.

The Movement Toward a Global Community is to Proceed in a Piecemeal Fashion

"Movement toward a larger community of the developed nations will necessarily have to be piecemeal, and it will not preclude more homogeneous relationships within the larger entity. Moreover, such a community cannot be achieved by fusing existing states into one larger entity. The desire to create one larger, formal state is itself an extension of reasoning derived from the age of nationalism. It makes much more sense to attempt to associate existing states through a variety of indirect ties and already developing limitations on national sovereignty.

The Need to Link the Soviet Union, Eastern Europe and Western Europe in Regional or Functional Forms of Cooperation

"In this process, the Soviet Union and Eastern European the one hand and Western Europe on the other will continue for a long time to enjoy more intimate relationships within their own areas. That is unavoidable. The point, however, is to develop a broader structure that links the foregoing in various regional or functional forms of cooperation. Such a structure would not sweep aside United States-Soviet nuclear rivalry, which would remain the axis of world military might. But in the broader cooperative setting, the competition between the United States and the Soviet Union could eventually resemble in form late-nineteenth-century Anglo-French colonial competition: Fashoda did not vitiate the emerging European entente.

Construction of a Global Community Will Require Two Phases

"Movements toward such a community will in all probability require two broad and overlapping phases. The first of these would involve the forging of community links among the United States, Western Europe, and Japan, as well as with other

more advanced countries (for example, Australia, Israel, Mexico). The second phase would include the extension of these links to more advanced communist countries. Some of them – for example, Yugoslavia or Rumania – may move toward closer international cooperation more rapidly than others, and hence the two phases need not necessarily be sharply demarcated.

Structure and Focus: The Need for a High-Level Consultative Council for Global Cooperation

"The emerging community of developed nations would require some institutional expression, even though it would be unwise to seek to create too many binding integrated processes prematurely. A case can be made for initially setting up only a high-level consultative council for global cooperation, regularly bringing together the heads of governments of the developed world to discuss their common political-security, educational-scientific, and economic-technological problems, as well as to deal from that perspective with their moral obligations toward the developing nations. Some permanent supporting machinery could provide continuity to these consultations.

A Global Council to Deal with Developing Political Strategy

"Accordingly, such a council for global cooperation [later established as the Trilateral Commission'] would be something more than OECD in that it would operate on a higher level and would also be concerned with political strategy, but it would be more diffused than NATO in that it would not seek to forge integrated military-political structures. Nevertheless, a council of this sort – perhaps initially linking only the United States, Japan and Western Europe, and thus bringing together the political leaders of states sharing certain common aspirations and problems of modernity – would be more effective in developing common programs than is the United Nations, whose efficacy is unavoidably limited by the Cold War and by north-south divisions.

The Inclusion of Japan

"The inclusion of Japan would be particularly important, both to the internal development of Japanese life and to the vitality of such a community. Japan is a world power, and in a world of electronic and supersonic communications it is a psychological and political error to think of it as primarily an Asian nation. Japan needs an outlet commensurate with its own advanced development, not one that places it in the position of a giant among pygmies and that excludes it *de facto* from the councils of the real world powers. The regular American-Japanese cabinet-level talks are a desirable bilateral arrangement, but Japan will become more fully and creatively involved in world affairs in a larger setting of equal partners.

Sharing Responsibility with Japan

"Without such a larger setting, there is danger that the extraordinary pace of Japanese socio-economic development will become destructive. The automatic projections of Japanese growth into the future, made with increasing frequency in the late 1960s, are misleading; they do not make allowance for the destabilization effect of the impact of change on Japanese traditions. There is a real possibility that in the 1970s Japan will undergo extremely upsetting internal conflicts unless in some way Japanese idealism is both stimulated and turned to goals larger than insular and personal hedonism. International cooperation, involving the sharing with Japan of responsibility as well as of power, could provide such an outlet.

A Global Council Could Provide a Political-Security Framework

"Such a council would also provide a political-security framework in which the security concerns of each state could be viewed in a context that takes into account the inescapable connections between such matters as Soviet policy in Berlin and the Sino-Soviet crisis, Chinese nuclear development and its implications both for Japanese security and for East-West relations in Europe, and so on. Similarly, matters such as Japanese rearmament, possibly even Japan's acquisition of nuclear arms (thought by increasingly large numbers of Japanese to be likely during the second half of the 1970s), could be viewed in terms of this broader significance rather than as a response to purely local considerations.

Technological Cooperation Between Western Europe, Japan and the United States

"Indeed, given the nature of modern scientific developments and communications, it is not too early to think of technological cooperation between Western Europe and Japan, as well as between both of them and the United States, in some fields of defense.

The Projected World Information Grid

"Political-security efforts would, however, in all probability be second in importance to efforts to broaden the scope of educational-scientific and economic-technological cooperation among the most advanced industrial nations that are becoming post-industrial and are in some regards moving into the post-national age. The projected world information grid [Internet], for which Japan, Western Europe, and the United States are most suited, could create the basis for a common educational program, for the adoption of common academic standards, for the organized pooling of information, and for a more rational division of labor in research and development.

An Information Linkage Between the Universities of New York, Moscow and Tokyo

"Computers at M.I.T. have already been regularly 'conversing' with Latin American universities, and there is no technical obstacle to permanent information linkage between, for example, the universities of New York, Moscow, Tokyo, Mexico City, and Milan.

An International Educational System

"Such scientific-informational linkage would be easier to set up than joint educational programs and would encourage an international educational system by providing an additional stimulus to an international division of academic labor, uniform academic standards, and a cross-national pooling of academic resources.

Pooling of Trilateral Resources Could Accelerate International Cooperation

"Steps in that direction could be accelerated by some symbolic joint actions. Space exploration is probably the most dramatic example of human adventure made possible by science, but currently it is almost entirely monopolized on a competitive basis by the United States and the Soviet Union. The pooling of Western European, Japanese, and American resources for a specific joint undertaking could do much to accelerate international cooperation. In addition, it may be desirable to develop an international convention on the social consequences of applied science and technology. This not only would permit the ecological and social effects of new techniques to be weighed in advance but would also make it possible to outlaw the use of chemicals to limit and manipulate man and to prevent other scientific abuses to which some governments may be tempted.

The Need for Intensive Efforts to Shape a New World Monetary Structure

"In the economic-technological field some international cooperation has already been achieved, but further progress will require greater American sacrifices. More intensive efforts to shape a new world monetary structure will have to be undertaken, with some consequent risk to the present relatively favorable American position.

The Need to Abandon Certain Restrictions on Multinational Corporations

"Further progress would in all probability require the abandonment of restrictions, imposed by Congress in 1949 and 1954, on the international activities of American corporations and on their foreign subsidiaries and plants.

The Appearance of an International Structure of Production and Financing Could Facilitate the Creation of a Free Trade Area

"The appearance of a truly international structure of production and financing would have to go hand in hand with the emergence of a 'theory of international production,' needed to supplement our present theories of international trade. Progress along these lines would also facilitate the creation of a free-trade area, which could be targeted in progressive stages.

The Soviet Union May Eventually Participate in the New Emerging International System

"The Soviet Union may come to participate in such a larger framework of cooperation because of the inherent attraction of the West for the Eastern Europeans – whom the Soviet Union would have to follow lest it lose them altogether – and because of the Soviet Union's own felt need for increased collaboration in the technological and scientific revolution. That Eastern Europeans will move closer to Western Europe is certain.

Results of East-West Arrangements

"The events of 1968 in Czechoslovakia are merely an augury of what is to come, in spite of forcible Soviet efforts to the contrary. It is only a matter of time before individual communist states come knocking at the doors of EEC or OECD; hence, broader East-West arrangements may even become a way for Moscow to maintain effective links with the Eastern European capitals.

Communist Nations May Someday Join the Common Market

"The evolution of Yugoslavia thinking and behavior attests to the fact that the communist states are not immune to the process of change and to intelligence Western initiatives. Slightly more than twenty years ago, Yugoslavia pronouncements were not unlike those of the Chinese today. Yet Yugoslavia now leads all communist states in economic reform, in the openness of its society, and in ideological moderation. In the late 1960s, it joined GATT, and Yugoslavia's association with EFTA – and perhaps eventually with the Common Market – is a probability. While still committed to the notion of 'socialism,' Yugoslavia's views on international politics are moderate, and they have had a significant impact on communism in Eastern Europe.

The East's Slow Movement Toward a Merger with the West

"Similar trends are slowly developing elsewhere in the communist world. To be sure, they are opposed by entrenched bureaucrats, but in the long run the reactionaries are fighting a losing battle. Social forces are against them, and the conservative elites are on the defensive everywhere. It is doubtful whether they can

reserve, though they certainly can delay, the trend toward a more open, humanistic, and less ideological society. The resistance of those regimes dominated by entrenched conservative bureaucracies will be further weakened if the West views the Cold War as primarily due to the fading self-serving doctrines of the Communist rulers, if it approaches the Cold War more as an aberration and less as a mission.

The Need to Create East-West Institutions to Facilitate Cooperation

"Over the long run – and our earlier analysis indicates that it would be a long run – Soviet responsiveness could be stimulated through the deliberate opening of European cooperative ventures to the East and through the creation of new East-West bodies designed initially only to promote a dialogue, the exchange of information, and the encouragement of a cooperative ethos.

The Need to Develop Common Objectives Between East and West

"The deliberate definition of certain common objectives in economic development, technological assistance, and East-West security arrangements could help stimulate a sense of common purpose and the growth of a rudimentary institutional framework. (For example, through formal links in the economic sphere between OECD and the Council for Mutual Economic Assistance [CEMA]; in the security sphere between NATO and the Warsaw Pact, and through United States-Soviet arms-control arrangements; or by the creation of an information East-West political consultative body.)

Beneficial Effects of the Large Cooperative Goal of a Community of Nations

"A larger cooperative goal would also have other beneficial effects. For one thing, it is likely that the Soviet Union would initially demonstrate hesitancy or even hostility in the face of Western initiative. Therefore, an approach based on bilateral American-Soviet accommodation – as advocated by some Americans – might prove to be abortive and would consequently intensify tensions.

Efforts to Construct a Global Community Need Not be Halted by Initial Soviet Reluctance

"But efforts to create a larger cooperative community need not be halted by initial Soviet reluctance, nor can they be easily exploited by Moscow to perpetuate the Cold War. On the contrary, Soviet resistance would only result in more costly Soviet isolation. By seeking to cut Eastern Europe off from the West, the Soviet Union would inevitably also deny itself the fruits of closer East-West technological cooperation.

Eastern European States Are Gradually Shifting Toward Greater Cooperation with the EEC and OECD

"In 1985 the combined GNP of the United States, Western Europe, and Japan will be roughly somewhere around three trillion dollars, or four times that of the likely Soviet GNP (assuming a favorable growth rate for the Soviets); with some Eastern European states gradually shifting toward greater cooperation with EEC and OECD, the Soviet Union could abstain only at great cost to its own development and world position.

Risks and Advantages of Developing a Global Community

"The shaping of such a community may well provoke charges that its emergence would accentuate the divisions in a world already threatened by fragmentation. The answer to such objections is twofold: First, division already exists, and our present problem is how best to deal with it. As long as the advanced world is itself divided and in conflict, it will be unable to formulate coherent goals. The less developed countries may even be benefiting from the internal rivalries in the developed world, which incite it to compete in extending aid; but since such aid tends to be focused on short-term political advantages to the donor, it is subject to political fluctuations and may decline as the rivalry declines in intensity.

Development of a Global Community Will Increase International Development

"Second, the emergence of a more cooperative structure among the more developed nations is likely to increase the possibility of a long-range strategy for international development based on the emerging global consciousness rather than on old rivalries. It could hence diminish the desire for immediate political payoffs and thus pave the way for more internationalized, multilateral foreign aid. While the viewing problems of tariffs and trade with the Third World are not likely to disappear, they might become more manageable in a setting that reduces both the impediments to truly international production and, consequently, a given country's stake in this or that protective arrangement.

The Underlying Motivation for Developing a Global Community

"The underlying motivation for such a community is, however, extremely important. If this community does not spring from fear and hatred but from a wider recognition that world affairs will have to be conducted on a different basis, it would not intensify world division – as have alliances in the past – but would be a step toward greater unity.

The Appearance of a Global Community Among the Advanced States Would Accelerate Development of International Institutions and a Global Taxation System

"Its appearance would therefore assist and perhaps even accelerate the further development of present world bodies – such as the World Bank – which are in any case *de facto* institutions of the developed world geared to assisting the Third World. A greater sense of community within the developed world would help to strengthen these institutions by backing them with the support of public opinion; it might also eventually lead to the possibility of something along the lines of a global taxation system.

Advantages to America of Joining the Emerging Global Community

"More specifically, America would gain several advantages from its identification with a larger goal. Such a goal would tend to reduce the increasing danger of American isolation in the world; this isolation is unavoidably being intensified by the problems associated with America's domestic leap into the future. Moreover, the United States cannot shape the world singlehanded, even though it may be the only force capable of stimulating common efforts to do so.

A Joint Response by Trilateral Countries to World Problems

"By encouraging and becoming associated with other major powers in a joint response to the problems confronting man's life on this planet, and by jointly attempting to make deliberate use of the potential offered by science and technology, the United States would more effectively achieve its own proclaimed goal.

The Atlantic Union Concept is Outdated

"The quest for that goal cannot, however, be geographically confined to the Atlantic world, nor should its motivation be even implicitly derived from security fears stimulated by a major outside power. One reason for the declining popular appeal of the Atlantic concept is the latter's association with the conditions of post-World War II Europe and with the fear of Soviet aggression. While such a concept was a bold idea at the time, it is now historically and geographically limited.

Trilateralism is a More Ambitious and Relevant Approach

"A broader, more ambitious, and more relevant approach is called for by the recognition that the problems of the 1970s will be less overtly ideological, more diffuse – they will more widely reflect the malaise of a world that is still unstructured politically and highly inequalitarian economically.

The Initiative for an Undertaking on Such a Grand Scale Would Have to Come from the U.S.

"Such an approach would also tend to end the debate over American globalism. The fact is that much of the initiative and impetus for an undertaking on so grand a scale will have to come from the United States. Given the old divisions in the advanced world – and the weaknesses and parochialism of the developing nations – the absence of constructive American initiative would at the very least perpetuate the present drift in world affairs. That drift cannot be halted if the United States follows the path which it is now fashionable to advocate – disengagement. Even if, despite the weight and momentum of its power, America could disengage itself, there is something quaintly old-fashioned in the eloquent denunciation of United States global involvement, especially when it comes from Europeans, who have shown a less than admirable ability to maintain world peace.

The U.S. Is Beginning to Seek World-Wide Arrangements

"Moreover, even the most brilliant indictment of United States policy cannot erase the fact that, despite its allegedly long record of errors and misconceptions, the United States has somehow become the only power that has begun to think in global terms and actively seek constructive worldwide arrangements. In this connection, it is revealing to note that initiatives such as the Test-Ban Treaty or the Non-Proliferation Treaty were opposed by governments habitually praised by some critics of United States global involvement.

America's Commitment to International Affairs Cannot Be Undone

"This country's commitment to international affairs on a global scale has been decided by history. It cannot be undone, and the only remaining relevant question is what its form and goals will be.

The Debate on Globalism

"The debate on globalism did, however, perform one useful function. Though much of the criticism did not provide a meaningful policy program, the debate prompted greater recognition of the need to redefine America's world role in the light of new historical circumstances. Thrust into the world by its own growth and by the cataclysms of two world wars, America first actively promoted and then guaranteed the West's economic recovery and military security. This posture – of necessity heavily marked by military preoccupations – has increasingly shifted toward a greater involvement with the less political and more basic problems that mankind will face in the remaining third of the century.

The First Globalist President of the U.S.

"John Kennedy caught the essence of America's novel position in the world when he saw himself as 'the first American President for whom the whole world was, in a sense, domestic politics.' Indeed, Kennedy was the first 'globalist' president of the United States. Roosevelt, for all his internationalism, essentially believed in an 1815-like global arrangement in which the 'Big Four' would have specific spheres of influence. Truman primarily responded to a specific communist challenge, and his policies indicates a clear regional priority. Eisenhower continued on the same course, occasionally applying European precedents to other regions. These shifts were symptomatic of the changing United States role. With Kennedy came a sense that every continent and every people had the right to expect leadership and inspiration from America, and that America owed almost equal involvement to every continent and every people. Kennedy's evocative style, which in some ways appealed more to emotion than to intellect, stressed the universal humanism of the American mission, while his romantic fascination with the conquest of space reflected his conviction that America's scientific leadership was necessary to its effective world role.

The U.S. Needs to Give Direction and Expression to the Emerging Global Economy

"Global involvement is, however, qualitatively different from what has to date been known as foreign policy. It is inimical to clear-cut formulas and traditional preferences. But this intellectual complexity does not negate the fact that for better or for worse the United States is saddled with major responsibility for shaping the framework for change. This point of view is subject to easy misrepresentation and is highly unpopular in some circles. World conditions do not call for a Pax Americana, nor is this the age of American omnipotence. Nevertheless, it is a fact that unless the United States, the first global society, uses its preponderant influence to give positive direction and expression to the accelerating pace of change, that change not only might become chaos – when linked to old conflicts and antipathies – but could eventually threaten the effort to improve the nature and the character of American domestic life.

A Community of Developed Nations Is Less Ambitious Than a World Government

"To sum up: Though the objective of shaping a community of the developed nations is less ambitious than the goal of world government, it is more attainable. It is more ambitious than the concept of an Atlantic community but historically more relevant to the new spatial revolution.

Eventual Reconciliation Between Communist and Non-Communist Nations

"Though cognizant of present divisions between communist and non-communist nations, it attempts to create a new framework for international affairs not by exploiting these divisions but rather by striving to preserve and create openings for eventual reconciliation. Finally, it recognizes that the world's developed nations have a certain affinity, and that only nurturing a greater sense of communality among them can an effective response to the increasing threat of global fragmentation – which itself intensifies the growing world-wide impatience with human inequality – be mounted." (New York: Penguin Books, 1970, pp. 293-308.)

Prominent Men of the World Embrace Trilateralism

From Dr. Brzezinski's outline of trilateralism we find that a number of prominent and influential men have abandoned the concept of an Atlantic Union in favor of a trilateral union. Dr. Brzezinski talks of a future "community of nations," a "gradual evolution of a new international system" and a "new fabric of international relations." He acknowledges that the emerging European Community will greatly accelerate the growth of a new world order.

Piecemeal Construction of a Global Community

Dr. Brzezinski does not feel that the construction of a global community or community of nations is "utopianism," but rather that it is the "coming decade's major task." He notes that there will need to be "deliberate efforts to accelerate the process of international cooperation among the advanced nations." He states that movement toward this future global community will probably "require two broad and over-lapping phases." The first phase is the convergence of the governments of the "United States, Western Europe and Japan, as well as those of other more advanced countries." The second phase is the convergence of the advanced countries with the "more advanced communist countries."

A Future World State

The end result of all the "forging of community links" among the advanced countries and communist countries will be a world state administered by the elites of New York, London, Paris, Rome, Tokyo and Moscow.

Dr. Brzezinski observes that the eventual construction of a global community would require "some institutional expression." He proposes the establishment of a "council for global cooperation," which was officially launched in 1973 as the Trilateral Commission, with headquarters in New York, Paris and Tokyo.

The Trilateral Commission Is to Develop Common Political and Economic Policies

Dr. Brzezinski stated that the Trilateral Commission was to be "something more than OECD in that it would operate on a higher level and would also be concerned with political strategy." It "would be more effective in developing common programs than is the United Nations."

A Projected World Information Grid

Dr. Brzezinski noted that there is a need to "broaden the scope of educational-scientific and economic-technological cooperation among the most advanced industrial nations." He talks of a "projected world information grid," of an "international educational system" and "common educational programs]" and "uniform academic standards." He talks of "permanent [computer] information linkage[s]" with "the universities of New York, Moscow, Tokyo, Mexico City and Milan."

Shaping a New World Monetary System Will Require American Sacrifices

Dr. Brzezinski acknowledges that "greater American sacrifices" will be required inasmuch as "more intensive efforts to shape a new world monetary structure will have to be undertaken, with some consequent risk to the present relatively favorable American position." He calls for the "abandonment of restrictions, imposed by Congress in 1949 and 1954, on the international activities of American corporations and on their foreign subsidiaries and plants." He notes that "the appearance of a truly international structure of production and financing would have to go hand in hand with the 'theory of international production.'"

Collaboration Between East and West

Dr. Brzezinski forecasts that "it is only a matter of time before individual communist states come knocking at the doors of the EEC or OECD." He suggests that a "deliberate definition of certain common objectives in economic development, technological assistance, and East-West security arrangements could help stimulate a sense of common purpose and the growth of rudimentary institutional framework" between the advanced countries and the communist countries.

A Call for an East-West Political Consultative Body

Dr. Brzezinski calls for greater "formal links in the economic sphere between OECD and the Council for Mutual Economic Assistance (CEMA) and through the United States-Soviet arms-control arrangements." He also calls for the "creation of an East-West political consultative body."

The USSR Will Eventually Merge with the Developing Global Community

Dr. Brzezinski states that "efforts to create a larger cooperative community need not be halted by initial Soviet reluctance" and that "the Soviet Union could abstain only at great cost to its development and world position."

Accelerating the Development of World Bodies

Dr. Brzezinski notes that "the emergence of a more cooperative structure among the more developed nations (i.e., economic summits) is likely to increase that possibility of a long-range strategy for international development." The development of a "more cooperative structure among the more developed nations would therefore assist and perhaps even accelerate the further development of present world bodies – such as the World Bank."

Dr. Brzezinski states that, "a broader, more ambitious and more relevant approach is called for" in the construction of a global community. He notes that "much of the initiative and impetus for an undertaking on so grand a scale will have to come from the United States."

A Global Community of the Advanced Countries Is More Attainable Than a World Government

Dr. Brzezinski concludes by saying, "Though the objective of shaping a community of the developed nations is less ambitious than the goal of a world government, it's more attainable."

The Groundwork for Trilateralism Is Laid by Tripartite Studies

Through the publication of *Between Two Ages – America's Role in the Technetronic Era*, the world was introduced to the new concept of trilateralism. It was now time to see if leading scholars and academics from the trilateral areas could really work together effectively. Dr. Brzezinski convinced Huntington Harris, a trustee of the Brookings Institution in Washington, D.C., to finance a series of tripartite studies. The first tripartite study was entitled "Reshaping the International Economic Order" and was authored by twelve economists from North America, the European Economic Community and Japan. C. Fred Bergsten, Richard N. Cooper, Edward R. Fried, Fritz Machlup and Ray A. Matthews were the North American rapporteurs; Sir Alex Cancross, Jean-Claude Casanova, Don Guido Colonna di Paliano were the European rapporteurs; and Motoo Kaja, Saburo Okita and Kiichi Saeki were the Japanese rapporteurs. They met at Brookings from December 18-21, 1971. Their final report, published in January of 1972, was jointly sponsored by the European Community Institute for University Studies in Brussels, the Japan Economic Research Center in Tokyo, and the Brookings Institution in Washington, D.C.

Reshaping the International Economic Order

The 1972 report began with the following suggestions:

"Although the immediate international economic problems have now been resolved, or seem on their way to early resolution, the underlying and basic issues remain. These include the necessary revision of the monetary and trading systems, the roles of capital and investment flows, the state of development assistance, and the monetary aspects of mutual defense arrangements.

The U.S., the EC and Japan Must Accept Joint Responsibility for Direction of the International Economic System

"Taken together, these issues present broad choices as to how the international economic system should be reordered: the leading industrial powers – the United States, the European Community (EC), and Japan – must either accept joint responsibility for the direction of the international economic system or risk a drift toward a world of restrictionism.

The Need for Increased Interdependence and Cooperation

"The choice should be in favor of increased interdependence and cooperation. The forthcoming negotiations should deal comprehensively with the main elements of the international economy. To this end, an effort should be made to register large and early progress in the five fields described below.

Reform of the Monetary System

"1. Reform of the monetary system should focus on three principal points:

– Small and more frequent changes in par values should be a central part of the process of adjusting to changing competitive conditions.

– The United States should be ready in the future to cover its basic deficits with reserve assets, once the excess dollars held abroad have been funded, presumably under arrangements to be managed by the International Monetary Fund (IMF).

– Additions to international reserves should be created by deliberate design of the members of the IMF; an international unit should replace the dollar as the world's main reserve.

A Renewed Attack on Barriers to International Trade

"2. A renewed attack should be made by the advanced industrial countries on remaining barriers to international trade.

- Tariffs and quotas on manufactured goods and raw materials should be eliminated in stages, over a ten-year period.

- A linked negotiation on agricultural protection should aim at removing quotas on farm products and placing internationally agreed limits on domestic programs that induce production at high costs.

- Voluntary export restraints and export subsidies on manufactured goods should also be phased out and agreement reached on international rules governing other nontariff restrictions.

- Any relief required for particular industries should be limited in time, diminishing in incidence, and subject to international surveillance.

The Need for Greater Cooperation Concerning Capital Flows and Investment

"3. Greater international cooperation concerning capital flows and investment is needed.

- Harmonization of the monetary policies of the major countries should be the long-term answer to large speculative flows. In the interim, swaps and controls over financial institutions must be used to deal with such disequilibrating capital movements as may occur in spite of wider margins and more flexible parities.

- The removal of balance-of-payments restrictions on foreign investment should go hand in hand with improvements in the international adjustment process.

- The international community should develop rules against tax or subsidy incentives intended to induce inward investment flows, as well as rules to assure that direct investments do not diminish competition or create private barriers to trade.

Development Assistance and Monetary Reform

"4. Development assistance should be linked with international monetary reform.

- New allocations of Special Drawing Rights (SDRs) should be assigned in part for international development lending.

- The funding with the IMF of outstanding dollar and sterling balances could provide an additional means – by using net interest earnings on these balances or by gradual transfer of funded dollars and sterling to international institutions – for increased multilateral development aid.

The Monetary Aspect of Mutual Defense Arrangements

"5. The monetary aspect of mutual defense arrangements should be better understood.

– The balance-of-payments effects of expenditures by the United States and other military forces abroad could suitably be offset by added purchases of military equipment, if and when needed equipment is available at lower costs.

– To the extent that balance-of-payments consequences cannot be thus offset, the international adjustment process must do the work; in a system of more flexible exchange rates, the long standing dispute about the balance-of-payments burden of military alliances should be set aside once and for all.

A Secure World Order at Stake

"What is at stake in all of this is not merely increased economic efficiency. What is involved is the wider question of how the European Community, Japan, and the United States should order their relationship. If economic differences drive them apart, prospects for a secure world order will be notably prejudiced. If they can come together, these prospects will be enhanced. This is business of the greatest importance, to which the countries represented should address themselves without delay." (Washington, D. C., The Brookings Institution, 1972, pp. 1-3.)

Reassessing North-South Economic Relations

The next tripartite meeting was held in Brussels on November 9-15, 1972. Under the chairmanship of Max Kohnstamm, thirteen leading academicians prepared a report entitled "Reassessing North-South Economic Relations." The report dealt with the "possibilities for actions by the industrial countries in the fields of trade, private capital flows, and development assistance." (Washington, D. C., The Brookings Institution, p. 31.) In their concluding remarks the authors stated:

"If, further, the hopeful signs of a lessening of East-West tensions are borne out, then we can begin – with the Soviet Union – to direct resources on a very large scale from military uses to the pressing needs of the poorer countries as well as to our problems at home.

"The truth is that we have the wealth, the productive capacity, the skills and the knowledge, not to make over the world but assuredly to provide in a decade the basis for genuine hope for the future. Our potential is immensely greater than the difficulties that seem so large when we look at the matters separately and narrowly.

"To set its relations with the South on a new and hopeful cause, the North needs only to widen its vision." (*Ibid.*, pp. 31-32.)

Acceptance of Tripartite Studies

The tripartite or trilateral meetings and publications were well received in high circles. This is, of course, what Dr. Brzezinski and others had hoped would occur.

Historical Beginnings of the Trilateral Commission

In March of 1972 David Rockefeller, Chairman of the Chase Manhattan Bank, gave three significant speeches in Europe that were to alter somewhat the role of international affairs in the years to come. Mr. Rockefeller proposed the creation of an International Commission for Peace and Prosperity. This idea was, in essence, Brzezinski's earlier trilateral plan for a "high-level consultative council for global cooperation."

Speaking at Chase Manhattan International Financial Forums in London, Brussels and Paris, Mr. Rockefeller stated the following:

Growing Interdependence of Domestic and International Issues

"Not long ago, I was in Peoria, Illinois, visiting the headquarters of the Caterpillar Tractor Company. On the grounds of their headquarters building, I noticed the flags of ten countries on five continents flying alongside the American flag – representing nations in which the firm has subsidiaries or affiliates. Seeing this international display in the heartland of America – sometimes regarded as a bastion of isolationism – I couldn't help thinking that it is truly symbolic of the increasingly close interrelationship of domestic and international issues.

Desire to Rejuvenate Atlantic Alliance

"This growing interrelationship reinforces my belief my belief that in the 1970's we may be able to rejuvenate the Atlantic Alliance around a common concern with our common domestic problems. I think we can hope to acknowledge the mutuality of our problems and to make out of our common foreign policy objectives.

Need to Mobilize New Constituencies

"To do so, we are going to have to mobilize new constituencies to speak for those groups in society that have the largest stake in expanding trade and investment – namely the consumers, the young people, the professional groups. A whole generation on both sides of the Atlantic and Pacific has grown up thinking internationally as no generation ever did before them. The future of the alliance rests on their giving voice to what they have learned.

New International Institution Needed

"In looking ahead, I believe that a major challenge will be to reconcile domestic and international objectives in a manner which will lead to a new period of peace and prosperity. In my judgment, it is possible to affect such a reconciliation, assuming there is continued cooperation among the leading nations. But I believe that a new mechanism would be helpful in enabling us to deal more effectively with the changes which lie ahead. We need a system which can mobilize the best available knowledge and focus it on the practical problems of our times.

Private Organization of the Best Brains in the World

"I would propose the creation of an International Commission for Peace and Prosperity. What I have in mind is a private organization whose primary objective, as I see it, would be to bring the best brains in the world to bear on the problems of the future. This organization would examine the interrelationships between domestic and foreign preoccupations, study new approaches to the transfer of 'social technologies,' and hopefully come up with fresh insights on how we deal with common problems.

Governing Board

"There might be a Governing Board of, say, 30-to-40 leading private citizens, drawn from the Atlantic Alliance nations and Japan. Sub-commissions could be set up to cover such vital fields as the reduction in world tensions, international trade and investment, environmental problems, control of crime and drugs, population control, and assistance to the developing nations. Government officials could certainly be invited to sit in as observers at the deliberations, as could representatives from the Communist countries.

Rebuilding a Framework of Domestic and Foreign Policies

"Because I am strongly opposed to commissions that outlive their usefulness, I would put an arbitrary deadline of two years on this effort. I hope that such a span would be sufficient to collect and synthesize the knowledge that would enable a new generation to rebuild the conceptual framework of foreign and domestic policies.

Economic Integration Taken for Granted

"Members of this new generation will move far more easily than their predecessors across national and linguistic barriers. They will take a degree of economic integration for granted and will – if they are given a chance – resist those who want to retreat again into isolation. If our generation will hand on to them many vexing problems and questions about the goals of society, we will also hand on greater resources than mankind has ever known.

Creating a Community of Interest

"I am confident that in the 1970's, as new men and women come to power in government and industry, in the universities and in the trade unions, we will find it easier than it presently appears to create a community of interest built around the many domestic problems we share, for there will be many more in all of our countries who know first-hand how much we have in common." (Manuscript copy. New York: The Trilateral Commission, pp. 5-6.)

Reaction to David Rockefeller's Proposal

George S. Franklin, former Executive Director of the Council on Foreign Relations from 1953-1971 and formerly the Coordinator for the Trilateral Commission, speaking of the reception of David Rockefeller's speeches in Europe, remarked:

"...He didn't receive an enthusiastic response in these meetings and he dropped the idea. He thought, 'If the Chase Bank Forums don't respond favorably to my suggestion then it's probably a lousy idea.'

"He then went to a Bilderberg meeting and Mike Blumenthal (Secretary of Treasury) was there...and he said, "You know, I'm very disturbed. Cooperation between these three areas – Japan, the United States and Western Europe – is really falling apart, and I foresee all sorts of disaster for the world if this continues. Isn't there anything to be done about it?' David then thought, 'I'll present the idea once more,' which he did and he aroused great enthusiasm.

"The next eight speakers said that this was a marvelous idea; by all means, somebody get it launched." ("Interview with George S. Franklin," September 12, 1977, *Freemen Digest*, January 15, 1978, p. 15.)

As a result of the enthusiastic response at the Spring 1972 Bilderberg Meeting, George S. Franklin stated: "...David asked me if I would go back to Europe and talk to some people more at leisure and see if they really thought this was a good idea. They truly did.

"David and I went to Japan in June of 1972 and he talked to a lot of people there. They thought it was a good idea, so we had a meeting of 13-15 people, I forget exactly how many, at his place in Tarrytown (New York). It was decided to go ahead and try to organize and form it....

"David said, 'Now, who should be the chairman of the Commission?' And it was decided to have three chairmen. Bob Bowie originally suggested Gerard Smith as the American Chairman, and I can't remember who suggested Watanabe as the Japanese Chairman or Max Kohnstamm as the European Chairman. In each case

the choice of the chairman was left to the particular region rather than trying to make a decision on it." (*Ibid.*)

Establishment of the Trilateral Commission

The organizing meeting of the Trilateral Commission was held July 23-24, 1972, at Pocantico Hills in New York. Those present at this important meeting included Messrs.: C. Fred Bergsten, Senior Fellow, The Brookings Institution; Robert Bowie, Clarence Billon Professor of International Affairs, Harvard University; Zbigniew Brzezinski, presently Special Assistant to the President for National Security Affairs; McGeorge Bundy, President, Ford Foundation; Karl Corsteins, Christian Democratic Leader in the Bundestag, Germany; Guido Colonna di Paliano, President, La Rinascente and former member of the Commission of the European Community; Francois Duchene, Director, Centre for Contemporary European Studies, University of Sussex; Rene Foch, member of Executive Committee, Parti des Republicains Independents; George Franklin, Coordinator, The Trilateral Commission and former Executive Director, Council on Foreign Relations; Max Kohnstamm, President, European University Institute, Florence, Italy; Bayless Manning, Former President, Council on Foreign Relations; Kiichi Miyazawa, Member of the DIET and former Minister of Foreign Affairs; Kinhide Mushakoji, presently Vice Rector for Programs, United Nations University; Saburo Okita, President, Overseas Economic Cooperative Fund; Henry Owen, Director, Foreign Policy Studies, the Brookings Institution; David Rockefeller, Chairman, Chase Manhattan Bank; and Tadashi Yamamoto, President, Japan Center for International Exchange.

David Rockefeller initially served as the Organizing Chairman, while Max Kohnstamm served as the European Organizer.

In the Fall of 1972 the respective areas designated Gerard Smith as United States Chairman, Takeshi Watanabe as Japanese Chairman, and Max Kohnstamm as European Chairman. Zbigniew Brzezinski was selected to serve as the Commissions Director from July of 1973.

Source of Funding

In the meantime David Rockefeller and the Kettering Foundation had provided transitional funding. In January of 1973 Gerard Smith, Max Kohnstamm, Zbigniew Brzezinski and George Franklin held consultations with Takeshi Watanbe and the Japanese planning group members in Tokyo. It was during this time period that approval of the highest political and financial circles was obtained. In February of 1973 a formal proposal was submitted to the Ford Foundation to support the majority of the intellectual and research projects of the Commission. The funds were also to provide for administrative and promotional activities. In February additional support also was obtained from several other foundations. On March 29-31, 1973, a policy meeting was held in Europe. Gerard Smith, Max Kohnstamm,

Takeshi Watanabe, Zbigniew Brzezinski and several other members met to discuss initial task-force reports that were to appear later.

The "high-level consultative council for global cooperation" outlined in 1970 by Zbigniew Brzezinski, and the "International Commission for Peace and Prosperity" outlined in Europe in 1972 by David Rockefeller, were now formally established in 1973 as the Trilateral Commission.

The Commission Explains Why It Was Formed

An official Commission document provides the following information concerning its formation, aims and organization:

"The U.S., Western Europe and Japan face a common condition. They are the major industrial areas of the world, and they share common concerns with the problems of environment and post-industrial society, as well as common security concerns. These advanced areas are also the only regions with the economic and technological resources required to undertake an effective response to many of the larger problems besetting mankind. For all these reasons they share a global responsibility which makes the relationship among them of unique importance.

Serious Economic Problems Threaten Japan, Europe and the U.S.

"That relationship is threatened by serious problems, mainly in the economic field. Domestic concerns – in Japan, Europe, and the U.S. – make it difficult to resolve these problems in ways which will not drive these regions apart. It would be all too easy for leaders in each of these regions to seek domestic political advantage at the expense of long-term cooperation. Whether this can be averted hinges on public perception of what is at stake: the issue is not whether one of these regions can gain narrow economic advantage over the other, but whether the industrial nations can work together effectively in addressing the wide range of common concerns described above.

Joint Programs and Institutions Needed to Meet Common Needs

"This cooperation does not involve setting up a super-government to run the advanced world; it means the developed regions coming closer together in joint programs and institutions to meet common needs.

Advanced Communist States Could Participate in the Future

"It does not envisage a new anti-Communist alliance; indeed, at some point in the future the more advanced Communist states might choose to become partners.

Need for Transferring Large Resources from Northern to Southern Hemisphere

"It does not foreshadow a rich man's club. Working more closely together the industrial areas may not only sustain their own security and prosperity but also provide more effective assistance to poor nations. Indeed, one of their principal purposes might be to devise some systematic way of jointly transferring larger resources from the Northern to the Southern hemisphere.

Obstacle to Moving Toward Closer Concert among Developed Nations

"The obstacles to moving toward closer concert among the developed nations are evident: internal problems preoccupy all these areas, and international problems are viewed by these regions from different viewpoints. Yet the effort to find separate answers to these problems will not only fail, it may set in motion a backlash of recrimination and retaliation which could plunge us again into tensions and disputes reminiscent of the 1920's and 1930's. Thus, unless the developed nations can be brought closer together, the troubled peace of the last 25 years may some day be seen as a golden interlude between two ages of great troubles.

Creating a Community of Nations

"But another route is also open: toward increasing cooperation among the three great industrial areas. Because of their technological and economic interdependence, these areas have sufficient common interests to make up a community in fact, if not in form. Working together, they could not only enhance their own welfare and security but also seek progress in the Third World and improve relations with the Communist countries on a more enduring basis.

A Choice That Will Shape the Future of the World

"The choice between these two directions – between drifting apart and closer cooperation among the three advanced regions – will shape the world of the future. A private group can play a role in making that choice. To this end, David Rockefeller proposed the formation of a Trilateral Commission of leading private citizens from Japan, Europe and North America 'whose primary objective [was] to bring the best brains in the world to bear on the problems of the future.'

"The Commission will have three objectives:

Working Together on Common Matters

"(a) To involve a significant group of leaders from the three areas in working together on matters of common concern, thus lessening the communications breakdowns that have occurred in the past and helping to develop a shared understanding of the problems confronting us all.

Proposing Policies

"(b) To propose policies which Japan, the nations of the European Community and North America could follow in their economic relations, their political and defense relations, their relations with developing countries, and their relations with Communist countries. In the cases where it is not possible to reach agreement on what ought to be done, it may be possible to agree on certain things which ought not to be done. Though dealing primarily with problems of foreign policy, the Commission may also suggest approaches to common domestic problems facing the three industrial areas – so that these three areas can learn from each other's experience and assure that their domestic policies do not raise obstacles to effective cooperation.

Developing Support in Government and Private Sectors

"(c) To foster understanding and support of Commission recommendations both in governmental and private sectors in the three regions." (Official Document, New York: Trilateral Commission, March 15, 1973, pp. 1-4.)

Internal Organization of the Commission

The basic governance of the Trilateral Commission is through three chairmen from each of the three regions. According to the Commission:

Chairmen

"The work of the Organizing Chairman, David Rockefeller [was] taken over by three regional Chairmen. The regional Chairmen – one American, one European and one Japanese – will be in charge of the Commission's work. The Chairman, in view of the difficulty of the Commission's work, will devote a substantial percentage of their time to the venture....

Director

"Dr. Zbigniew Brzezinski, Director of the Research Institute on Communist Affairs, Columbia University, and formerly a member of the Policy Planning Council of the State Department [was the first] Director of the Commission with responsibility to the three Chairmen jointly. Starting July 1 [1977] he [directed] the Commission's work on a day-to-day basis, particularly the program of policy studies.

Executive Committee

"The principal policy organ of the Commission [is the] Executive Committee. It [is] responsible for the policy recommendations of the Commission. The [initial] Executive Committee [consisted] of nine members from Japan, nine from the

United States, two from Canada, and 14 from the European Community, a total of 34.

"Members of the Executive Committee will be appointed with deliberation....

"Each regional segment of the Executive Committee will be representative of different points of view and different professions – businessmen, labor leaders, academics, representatives of the media, etc....

Trilateral Task Force

"When the Executive Committee approves a subject for policy recommendations, a task force of some 15 individuals will be selected from the three regions to prepare policy recommendations for consideration. These task forces will be composed of leading experts in the field, including businessmen, journalists, academicians and individuals with experience in public service. If possible, they will include also one or more members of the Commission. There will be a principal rapporteur with primary responsibility for drafting the task force report and associate rapporteurs from a different region than that of the rapporteur.

Influential Members of the Commission

"The Commission will be made up of about 180 eminent private citizens drawn about equally from Japan, North America and Western Europe. The Commission members from each area will be chosen by the respective Chairmen, each of whom will consult with a broad group of individuals in making his selections. The need for diversity, professionally and geographically, will be met as well as the need for men and women of sufficient standing to influence opinion leaders, both public and private, in favor of the Commission's recommendations.

Agenda of Meetings

"It is contemplated that the full Commission may meet as a body only once during the three-year life of the project. However, as indicated in the attached memorandum on Task Forces, it is envisaged that Commissioners from a given region will meet in their own region to consider task force recommendations. Commission members will also keep in touch with the work of task forces by visits from members of the task forces, staff, etc. Only if Commissioners feel they have had a significant part of the development of recommendations will they be interested in promoting the recommendations subsequently in their countries and areas.

Informal Steering Group

"There will be an informal steering group to advise the three Chairmen of the Commission and the Director. It will consist perhaps of two leading personalities

from each of the three regions and the three Chairmen. The [initial] U.S. members will be the Chairman, Mr. Smith, as well as Mr. Rockefeller and Professor Reischauer.

Informal Advisory Council

"Heads of a number of the major internationally oriented institutes in the three regions will assist the three Chairmen and the Director of the Trilateral Commission in the formulation of the Commission's program. Some of the proposed reports might be prepared in collaboration with one or more of these institutes and at the very least close contact will enable the Commission to benefit from many ideas and to avoid undesirable duplication.

Purpose of the Program of Policy Studies

"The Trilateral Commission's Program of Policy Studies will have a three-fold purpose:

- (a) To provide the Commission with relevant and adequately researched policy recommendations on matters of common concern;
- (b) To cultivate among concerned Americans, Japanese, and Europeans the habit of working together on a trilateral basis in the formulation of joint policies;
- (c) To develop longer-range trilateral studies on subjects of concern to the three parts of the world.

Four Types of Studies

"To these ends, four types of studies are currently envisaged:

1. Task force reports and recommendations on matters of immediate urgency with regard to which some trilateral research has already been undertaken by other organizations and from which relevant policy recommendations may be extracted without the need for extensive prior research;
2. Longer-term task force undertakings, requiring more original research in depth, pointing also towards the generation of pertinent policy recommendations for adoption by the Commission.
3. Studies in depth undertaken either by three individuals, one from each area, or by a single person with a trilateral advisory group, designed to provide a systematic examination essentially of an academic character of political, economic, or social issues of concern to the three areas, yielding perhaps policy implications, though not designed explicitly to generate policy recommendations.

4. Consideration is also being given to the publication of annual reports on the state of trilateral relations or information bulletins, with the former meant for wider distribution and the latter designed primarily as an instrument of communications among Commission members.

Topics for Trilateral Study

"For planning purposes, six general topics are listed below as possible subjects of study for the task forces. The first three of the six are likely to be given priority, however. With the exception of perhaps one or two very obvious and urgent issues, there will be no final decision on subjects for Commission consideration until the Executive Committee is formed. The topics are:

1. Economic relations, including problems of money, trade and investments.
2. Security, arms control and nuclear proliferation.
3. Relations with developing countries;
4. Political implications of energy problems;
5. International institutions and political consultation;
6. Relations with Communist nations.

Long-Range Analytical Studies

"Other subjects, more suited for long-range analytical studies than for Commission recommendations, and resulting perhaps in publications, include (1) the effect of changes in values on the international system and (2) issues presented by the impact on modern society of science and technology. Such topics might be given to a single author with a trilateral advisory group or it may be desirable to commission three authors to work jointly. The authors would work in close consultation with one another and they, too, might have a small advisory group, so that the product would be joint one.

"Other topics which have been suggested for the Commission's work but which have not been extensively discussed include: a comparative study of the attitudes of the elites of the three areas toward one another; a joint proposal with regard to offshore boundaries and exploration of the seabed; joint rules for the multinational corporation; political implications of new means of social control over man's development and behavioral study of educational reforms in the three areas and their transferability; the respective experience of the three areas in coping with social problems posed by youth and by old age; and analysis of the international consequences of demographic growth.

A Report on the State of Trilateral Relations

"Consideration is being given to the issuance of a report on the state of trilateral relations, reviewing critical progress toward greater cooperation, and the appearance of new issues or frictions. The report would summarize proposals made during the year by the Trilateral Commission. It is hoped that such an annual report would gain recognition and acceptance among the media and the business communities (as, for example, has been the case with the annual reports of the International Institute of Strategic Studies).

Information Bulletin

"The Commission also is considering for limited circulation an information bulletin dealing with trilateral problems and relations and containing information not readily available elsewhere. If it proved useful, such a bulletin might develop into a Trilateral journal.

Summary of Trilateral Commission Goals

"The importance as well as uniqueness of the Trilateral Commission lies in the fact that it will be:

- (a) A Commission working on – and making recommendations on – policy.
- (b) Relating to a wide range of political and economic and military issues;
- (c) Bringing together in its work influential citizens of three vital segments of the world and accustoming them to work together.

"A detailed blueprint cannot be provided at this stage as to just how the Commission's activities will unfold, but it is hoped that the plans outlined above and the caliber of the leadership (and especially that it is full-time leadership) will give the necessary assurance that the Commission will move with imagination, energy, thoughtfulness and responsibility....." (*Ibid.*, pp. 4-12.)

Max Kohnstamm Outlines the Commission's Rationale

The Commission's rationale is well summarized in the following points made by Max Kohnstamm:

"...There is a considerable and indispensable difference between the attitude of the negotiator and the man who looks at a new problem and tries to find solutions for it.

"The essence of the second attitude is that one does not look upon the other as the fellow opposite, but tries together with him to understand the problem and after

having understood to find solutions for it. No good can come of mixing these two attitudes.

Real Research Needed

"I feel more strongly than ever that we need to do some hard clear thinking and ask together some very probing questions. Some of this work will probably demand real research, much of it will demand some of the best minds, basing themselves on knowledge already available, talking with each other in an atmosphere of a common quest for solutions and far removed from an attempt to negotiate.

Constant Checking with Those in Power or Who Have Considerable Influence on Those in Power

"This, which must be done by absolutely first-rate intellectuals, will tend to become irrelevant unless it is done in constant checking with those who are in power or have a considerable influence on those in power. It seems to me that the linkage between the kind of people we must get for our Trilateral Commission and the intellectuals doing the indispensable work of thinking about the elements for a new system is of the greatest importance. A Trilateral Commission without the intellectual will become very soon a second-class negotiating forum. The intellectuals not being forced to test their ideas constantly with the establishment of our world will tend to become abstract and therefore useless. I know that this linkage is difficult and I am well aware of the fact that we may not be able to do it as well as it should be done, but I think that not to try would be a very great pity.

Important New Economic Relationships to Be Established

"We may exaggerate the problems ahead but I feel that the next years are really going to be very important for the relationships between the great free market economies amongst each other and at the same time for the relations between them and the East and the South.

The Commission May Achieve Something of Real Value

"An attempt to bring to bear on the situation the joint effort of our very best minds and a group of really influential citizens in our respective countries may not be successful. But there is at least a good chance that it will achieve something of real value and it seems a pity not to try." (*Ibid.*, pp. 12-13.)

"The Vital Triangle"

In 1973 several articles began to appear pointing out the virtues of trilateralism. Gerard C. Smith, North American Chairman of the Trilateral Commission, in an article entitled "The Vital Triangle," stated:

"Trilateralism is, above all, a matter of attitude. Its essence lies in a common perception by the three great democratic industrialized areas that their prime interests intersect. Until planners and leaders in all three regions share this perception, co-operation will remain haphazard, uninspired, and hobbled by latent suspicions. Ultimately, each side must develop the habit of assessing all major international policies in terms of their effect on the trilateral relationship. Common policy will follow, as a matter of course, from common vision.

The Need for Significant Changes in Existing Attitudes

"Before this vision can be acquired, however, there must be significant changes in existing attitudes. Both North America and Europe must acknowledge the equality of Japan. The following words in Dr. Kissinger's speech to the Pilgrims in London last December could not have gone unnoticed in Japan: 'We are prepared to offer a unifying Europe a "special relationship," for we believe that the unity of the Western world is essential for the well-being of all its parts.' American policy must go a long way before it assuages Japan's fears of being relegated to a position in Washington's priorities that ranks considerably below our close and abiding friendship with Europe. Japan must not be given to think that she is merely being dragged in as an afterthought to some scheme elaborated by the Atlantic powers.

The Need to Develop a Sense of Common Destiny Between Tokyo and the European Capitals

"The Europeans seem to be even less aware of the implications of Japan's upward movement on the power scale. The thought patterns that are crucial to developing a sense of common destiny between Tokyo and the European capitals must be built from the group up. Many thoughtful Europeans realize that Japan cannot be overlooked by a major economic power such as the European Community. The increasing flow of Japanese tourists, no less than exports and investments, to Western Europe should be a signal to the Europeans that Japan is a power to be reckoned with and that such reckoning can best be realized in a clustering of common interests.

Trilateralism Does Not Represent Another Grand Design

"The development of trilateral ties also implies a recognition of what trilateralism is not. Trilateralism does not represent another Grand Design. Its intentions are modestly confined to improving communications and co-operation among the three major power centers that constitute the triangle. It does not seek to dismantle alliances, organizations, or arrangements that are presently in good working order; there is nothing inconsistent between trilateralism and good bilateral relations among all concerned. Nor is it intended to be a 'rich man's club', one of its prime aims should be a more rational allocation of resources to developing parts of the world.

Trilateralism Must Not Be Anti-Communist

"Finally, trilateralism must not be an anti-Communist league. Among its major purposes should be to continue the ongoing improvements in North American, European, and Japanese relations with the USSR and China." (*The Atlantic Community Quarterly*, Fall 1974, Vol. 12, No. 3, pp. 243-244. Originally published in *The World Today*.)

Development of Common Policies for the Trilateral Nations

Gerard C. Smith also noted in "The vital Triangle" that the "process of trilateral community-building should be initiated at once." (*Ibid.*, p. 344.) In reference to the development of common policies for the trilateral areas, he stated:

"...A trilateral approach to the broader problems of relations between Japan-Atlantica and the developing countries is needed. Growth in the developing countries hinges more than anything else on what these countries do to help themselves. But it also requires access to the markets of all the developed countries and this is more likely to come about if the developed country or group of countries will not have to face a disproportionate increase in its share of imports from developing countries. Bilateral aid to developing nations has lost its attraction. Acting together, the industrial countries may be able to devise effective substitutes: increased support of the World Bank and its soft-loan affiliate, greater aid to such regional institutions as the Asian Development Bank and the Inter-American Development Bank, monetary reform – whether through SDRs or otherwise – to convey increased resources to the developing countries, and the use of fees charged for exploitation of such common resources as the extra-territorial oceans for the same purpose. But none of these resources will come about unless Japan, Western Europe, and North America can work together effectively to this end. Concerting policies to ensure that the developing world has a fair chance of not becoming one vast disordered slum, breeding contagious violence, may be the single most important task for the three advanced regions.

Coordinating External and Domestic Policies in the Trilateral Nations

"In addition to coordinating their external policies, the three regions can also turn their collective attention to great common domestic problems. In such trouble areas as urban environment, education, and the clash of generations, the nations of the post-industrial world stand to learn a great deal from one another; they are most likely to make a dent in what seem to be impenetrable problems by pooling talents and resources.

Developing a Sense of Common Identity

"In this way, too, a sense of common identity can be forged, as each region comes to see parts of itself reflected in the domestic life of its two partners. Over time, these notions of common identity will stimulate common action.

Preparatory Work Will Be Required

"Before all of this can happen, a good deal of preparatory work will be required, at both governmental and non-governmental levels. Some useful preparatory work is already being carried out. Trilateral policy planning on economic issues is being conducted under the auspices of the Brookings Institution, the Japan Economic Research Center, and the European Community Institute of University Studies. Additional private trilateral approaches are also envisaged to seek common understanding of security problems by Brookings, the International Institute of Strategic Studies, and the Japan Institute of International Affairs – as well as by the Atlantic Council, the Atlantic Institute, and the Japan Society. New insights are constantly being generated by this process of private dialogue...." (*Ibid.*, pp. 348-349.)

Influencing Trilateral Governments

As noted above, one of the main purposes of the Trilateral Commission is to make policy recommendations to the government in each of the three regions. Mitchell Sharp, former North American Deputy Chairman, elaborated on this:

"There is no doubt...that the Commission's aim is to affect government. But...I don't think that the influence of the group is any greater than the total power of the individual members would be without the Commission." (*MacLean's*, October 17, 1977, p. 44.)

The Triangle Papers

One way which the Trilateral Commission influences government is through the publication of special task force reports called *Triangle Papers*. These reports are prepared for high-level governmental officials and contain policy recommendations which the Commission would like to see implemented. Rapporteurs are carefully selected from the three trilateral areas (United States, Japan and Western Europe). The *Triangle Papers* set forth the unofficial "grand design" of the Trilateral Commission.

Published Papers: Reports of the Task Forces

The first of the *Triangle Papers* appeared in 1973. To date there have been 47 *Triangle Papers* published with several in the writing stage at the present time. These include:

1. *"Towards a Renovated World Monetary System"*, 1973, by Richard N. Cooper, Motoo Kaji and Claudio Segre.
2. *"The Crisis of International Cooperation"*, 1974, by Francois Duchene, Kinhide Mushakoji and Henry Owen.
3. *"A Turning Point in North-South Economic Relations"*, 1974 by Richard N. Gardner, Saburo Okita and B.J. Undink.
4. *"Directions for World Trade in the Nineteen-Seventies"*, 1974, by Guido Colonna di Paliano, Philip H. Trezise and Nobuhiko Ushiba.
5. *"Energy: The Imperative for a Trilateral Approach"*, 1974, by John C. Campbell, Guy de Carmoy and Shinichi Kondo.
6. *"Energy: A Strategy for International Action"*, 1974, by John C. Campbell, Guy de Carmoy and Shinichi Kondo.
7. *"OPEC, the Trilateral World, and the Developing Countries: New Arrangements for Cooperation, 1976-1980"*, 1975, by Richard N. Gardner, Saburo Okita and B.J. Undink.
8. *"The Crisis of Democracy"*, 1975, by Michel Crozier, Samuel P. Huntington and Joji Watanuki.
9. *"A New Regime for the Oceans"*, (1976, by Michael Hardy, Ann L. Hollick, Johan Jorgen Holst, Douglas M. Johnson and Shigeru Oda.
10. *"Seeking a New Accommodation in World Commodity Markets"*, 1976, by Carl E. Beigie, Wolfgang Hager and Sueo Sekiguchi.
11. *"The Reform of International Institutions"*, 1976, by C. Fred Bergsten, Georges Berthoin and Kinhide Mushakoji.
12. *"The Problem of International Consultations"*, 1976, by Egidio Ortona, J. Robert Schaetzel and Nobuhiko Ushiba.
13. *"Collaboration with Communist Countries in Managing Global Problems: An Examination of the Options"*, 1977, by Chihiro Hosoya, Henry Owen and Andrew Shonfield.
14. *"Towards a Renovated International System"*, 1977, by Richard N. Cooper, Karl Kaiser and Masataka Kosaka.
15. *"An Overview of East-West Relations"*, 1978, by Jeremy R. Azrael, Richard Lowenthal and Tohru Nakagawa.

16. *"Expanding Food Production in Developing Countries: Rice Production in South and Southeast Asia"*, 1978, by Umberto Colombo, D. Gale Johnson and Toshio Shishido.
17. *"Energy: Managing the Transition"*, 1978, by John C. Sawhill, Keichi Oshima and Hanns W. Maull.
18. *"Collective Bargaining and Employee Participation in Western Europe, North America and Japan"*, 1979, by Benjamin C. Roberts, Hideaki Okamoto and George C. Lodge.
19. *"Industrial Policy and the International Economy"*, 1979, by John Pinder, Takashi Hosomi and William Diebold.
20. *"Major Payments Imbalances and International Financial Stability"*, 1979, by Masas Fujioka, Alexandre Lamfalussy and Bruce MacLaury.
21. *"Trade in Manufactured Products with Developing Countries: Reinforcing North-South Partnership"*, 1981, by Albert Fishlow, Jean Carriere and Sueo Sekiguchi/
22. *"The Middle East and the Trilateral Countries"*, 1981, by Garret FitzGerald, Arrigo Levi, Hideo Kitahara and Joseph J. Sisco.
23. *"The Trilateral Countries in the International Economy of the 1980s"*, 1981, by Miriam Camps, Ryokichi Hirono and Karsten Lursen.
24. *"East-West Trade at a Crossroads"*, 1982, by Robert V. Roosa, Michiya Matsukawa and Armin Gutowski.
25. *"Sharing International Responsibilities"*, 1983, by Nobuhiko Ushiba, Graham Allison and Thierry De Montbrial.
26. *"Trilateral Security"*, 1983, by Gerard C. Smith, Paolo Vittorelli and Kiichi Saeki.
27. *"Facilitating Development in a Changing Third World"*, 1983, by Takeshi Watanabe, Jacques Lesourne and Robert S. McNamara.
28. *"Democracy Must Work"*, 1984, by David Owen, Zbigniew Brzezinski and Saburu Okita.
29. *Agricultural Policy and Trade: Adjusting Domestic Programs In An International Framework*, 1985, by D. Gale Johnson, Kenzo Hemmi & Pierre Lardinois.

30. *East Asian Security and the Trilateral Countries*, 1985, by Masashi Nishihara.
31. *Prospects For East-West Relations*, 1986, by William G. Hyland, Karl Kaiser & Hiroshi Kimura.
32. *Conditions For Partnership In International Economic Management*, 1986, by C. Fred Bergstein, Etienne Davignon & Isamu Miyazaki.
33. *Restoring Growth In The Debt-Laden Third World*, 1987, by Martin Feldstein, Herve DeCarmoy, Koei Natusawa & Paul R. Krugman.
34. *Science & Technology*, 1987, by Takashi Mukaibo.
35. *East Asia In Transition: Challenges For The Trilateral Countries*, 1988, by Richard Holbrooke, Roderick MacFarquhar & Kazuo Nukazawa.
36. *East-West Relations*, 1989, by Valery Giscard D'Estaing, Yasuhiro Nakasone & Henry A. Kissinger.
37. *International Financial Integration: The Policy Challenges*, 1989, by Shijuro Ogata, Richard N. Cooper & Horst Schulmann.
38. *The Israeli-Palestinian Issue*, 1990, Garret Fitzgerald.
39. *Latin America At A Crossroads: The Challenge to the Trilateral Countries*, 1990, by George W. Landau, Julio Feo & Akio Hosono.
40. *Beyond Interdependence: The Meshing Of The World's Economy And The Earth's Ecology*, 1991, by Jim MacNeill, Pieter Winsemius & Taizo Yakushiji.
41. *Global Cooperation After The Cold War: A Reassessment of Trilateralism*, 1991, by Joseph S. Nye, Jr., Kurt Biedenkopf & Motoo Shiina.
42. *Regionalism In A Converging World*, 1992, by Toyoo Gyohten & Charles E. Morrison.
43. *Keeping The Peace In The Post-Cold War Era: Strengthening Multilateral Peacekeeping*, 1993, by John Roper, Masashi Nishihara, Olara A. Otunnu & Enid C.B. Schoettle.
44. *International Migration Challenges In A New Era*, 1993, by Doris M. Meissner, Robert D. Hormats, Antonio Garrigues Walker & Shijuro Ogata.
45. *An Emerging China In A World Of Interdependence*, 1994, by Yoichi Funabashi, Michel Oksenberg & Heinrich Weiss.

46. *Engaging Russia*, 1995, by Robert D. Blackwill, Rodric Braithwaite & Akihiko Tanaka.

47. *Revitalizing Trilateral Democracies*, 1995, Robert D. Putman, Jean-Claude Casanova & Seizaburo Sato.

48. *Energy Security*, William F. Martin, Ryukichi Imai and Helga Steeg

49. *Rising Income Inequalities and the Globalization of Markets*, Neils Thygesen, Yutaka Kosai and Robert Z. Lawrence

Trilateralists in the Reagan Administration

Many people felt that with the election of Ronald Reagan in 1980 that the tide of trilateralism would be turned back. Just the opposite occurred, however. Several former "trilateralists" occupied leading positions in the Reagan Administration. These included: George Bush, Vice-president; Casper Weinburger, Secretary of Defense; Paul Volcker, Chairman, Federal Reserve Board; Arthur Burns, Ambassador to Germany.

The fact that the Ottawa Summit was convened with U.S. participation demonstrates that trilateralism was progressing steadily, although it was not as obvious to the public as during the Carter Administration.

It appears that trilateralism is firmly entrenched as "unofficial" U.S. foreign policy. The only real visible change in America is the name of the President. Whether President Reagan personally accepted the concept of trilateralism is unknown, however, his appointments and policies, indicated an adherence to trilateral ideology and policies by several of his close advisors. President George Bush and President Bill Clinton have carried the banner of trilateralism forward in their respective administrations. We can safely predict that all future presidents will do the same unless there is a major change in U. S. Foreign Policy. In the days ahead, the power and influence of the Trilateral Commission will continue to grow as it guides the advanced nations of the world into the 21st century.

Brookings Institution Launches Its Integrating National Economies Project to Promote Trilateralism in the United States and Throughout the World

In 1993 the Brookings Institution in Washington, D. C. launched its "Integrating National Economies Project" to assist the Trilateral Commission in its effort to integrate the economies of the world. According to Brookings the INEP is "a major research effort among collaborators both inside and outside the Institution to take on the multifaceted challenges of economic integration. Directed by Brookings economists Henry Arron, Ralph Bryant, Susan Collins and former senior fellow Robert Lawrence, the INE Project has produced the most comprehensive analysis to date of the growth of global integration in many key

areas." (*Framing the Debate*, 1995 Annual Report, Washington, D.C.: Brookings Institution, 1995, p. 5.)

The Brookings Institution feels that the "world economy has entered a new phase requiring new rules and new levels of international cooperation. Cogent analysis of deeper international economic integration and guidelines for government policies, are urgent priorities. Integrating National Economies [Project] meets these needs in a series of 22 books by some of the world's leading economists, political scientists, foreign policy specialists, and government officials." (*Publications Catalog, Brookings*, Fall 1995, Washington, D.C.: Brookings Institution, 1995, p. 12.)

The Integrating National Economies Project has produced 22 remarkably revealing books. These volumes are designed to further the integration of the economies of the world and lay the foundation for the "new Imperial System" under construction. The books are designed to bolster public acceptance of the doctrine of trilateralism and global economic integration. The volumes in the INEP series include:

1. *Trade Policies and Developing Nations*, by Anne O. Krueger.
2. *International Coordination of National Stabilization Policies*, by Ralph C. Bryant.
3. *Russian, Eurasia, and the Global Economy*, by Peter Rutland.
4. *The Politics of Deeper Integration: National Attitudes and Policies in Japan*, by Akihiko Tanaka.
5. *Regionalism, Multilateralism, and Deeper Integration*, by Robert Z. Lawrence.
6. *Distributive Issues: A Constraint on Global Integration*, by Susan M. Collins.
7. *A Vision for the World Economy: Openness, Diversity, and Cohesion*, by Robert Z. Lawrence, Albert Bressand, and Takatoshi Ito.
8. *Reforming Planned Economies in an Integrating World Economy*, by Barry P. Bosworth and Gur Ofer.
9. *Environment and Resource Policies for the World Economy*, Richard N. Cooper.
10. *Labor Markets and Integrating National Economies*, by Ronald G. Ehrenberg.

11. *International Monetary Arrangements for the 21st Century*, by Barry Eichengreen.
12. *Financial Integration, Corporate Governance, and the Performance of Multinational Companies*, by Mitsuhiro Fukao.
13. *Developing Nations and the Politics of Global Integration*, by Stephen Haggard.
14. *Financial Regulation in the Global Economy*, by Richard J. Herring and Robert E. Litan.
15. *International Institutions and the Political Economy of Integration*, by Miles Kahler.
16. *Leadership Abroad Begins at Home: U.S. Foreign Economic Policy After the Cold War*, by Robert L. Paarlberg.
17. *Techno-Nationalism and Techno-Globalism: Conflict and Cooperation*, by Sylvia Ostry and Richard R. Nelson.
18. *Competition Policies for an Integrated World Economy*, by F. M. Scherer.
19. *How China Opened Its Door: The Political Success of the PRC's Foreign Trade and Investment Reforms*, by Susan L. Shirk.
20. *Product Standards for Internationally Integrated Goods Markets*, by Alan O. Sykes.
21. *Taxation in an Integrating World*, by Vito Tanzi.
22. *Regional Integration: The West European Experience*, by William Wallace.

The integration of the economies of the world is accelerating since the transformation of the General Agreement on Tariffs and Trade into the World Trade Organization in 1994. Various organizations such as the Trilateral Commission, Council On Foreign Relations, Atlantic Institute of the United States and the Brookings Institution will continue to prepare treatises on various aspects of the world economy and the areas where its needs to be adjusted and strengthened. The end result of their collective effort, along with dozens of similar organizations in Europe, Japan and elsewhere, will be the construction of a "new Imperial System" under the domination of powerful corporate leaders and international bankers that will rival the Roman Empire.

11. Economic Summitry – Institutionalizing Trilateral Supranational Rule

Part I. Introduction: Economic Summits – the Right Arm of Trilateralism

In an article entitled "Trilateral Governance" Jeremiah Novak, a leading economic analyst and author, has stated: "Far faster than most people realize the domestic and foreign policy of the United States is being influenced by a new supranational 'directory' operating on a governmental and private basis through clearly discernable institutions. Under the aegis of the Trilateral Commission and noted trilateralists in other countries of Western Europe and Japan, this supranational 'directory' – a new superstate – is gradually coming into control of the world economy. It is this directory which sets the pace for economic development and which determines its institutional shape." (Quoted in the *Freemen Digest*, Report No. 8, 1979, entitled "Trilateralism – A Critical Review," p. 130.)

Decision-Making at the International Level

We are in an age of transition with a pervasive political dimension. We are entering a new era of decision-making at the international level, an era of confrontation between nationalism and internationalism, of a new international economic and political system – the era of the trilateral superstate. The role of economic summitry in bringing this international superstate is of primary importance. concerning the summits, Jeremiah Novak has candidly stated:

"...Policy making in the age of Trilateralism has shifted from the Congress and even from the Administration of the United States to the supranational summits, where it is directly influenced by the members of the Trilateral Commission, the supranational preparatory groups and the supranational OECD. President Carter is not the President of the United States, but the general manager of a subsidiary of a supranational institution. Policy comes from the summits to the Administration, and is not the result of the desires of the American people or the people of the summit countries, who are unaware that the summits have been institutionalized into a semi-federal supranational directory." (*Ibid.*, p. 140.)

Understanding the Role of Economic Summits

In order to understand the pervasive role of economic summits, and thus better understand current U.S. Foreign and Economic Policy, it is necessary to first briefly trace the origin of the summits, which is linked directly to the origins of trilateralism. This review will set the stage for a discussion, which will follow, of the role of economic summits in the institutionalizing of trilateralism.

Part II. The Origin of Economic Summitry – Trilateralism

In 1968 Henry Owen, former Director of Foreign Policy Studies Program at the Brookings Institution and Special Representative of the President for Economic Summits and U.S. Ambassador at Large, traced the development of trilateralism as a new system for global governance in an article entitled "Foreign Policy Premises for the Next Administration":

I.

"...We are , at this very moment, passing through an age of transition.

"This transition has many aspects, of which the social and cultural may be the most important. But it also has a political dimension. It reflects the breakup of a world order in which the nature of power and authority has seemed reasonably clear in the developed world. After the political and economic revolutions which convulsed that world in the first half of the nineteenth century, peoples looked increasingly to the nation-state to meet their security and economic needs – and to provide a set of values which would give meaning to their lives. Within the nation-state, they looked increasingly to the central government as the symbol of national identity and the fountainhead of power and legitimate authority. And among national states they perceived adversary and hegemonical relations which provided a congenial outlet for the aggressive impulses which Dr. Lorenz has so well described in animal species, as well as for the collective pride which seems so highly developed among humans.

The New Order of Strong, Centralized Nation-States

"Despite the misgivings of such prophets as Acton and Burckhardt, mankind seemed to have found – in the new order of strong, centralized nation-states – a framework for enduring progress. A golden era appeared to be at hand, as stable and timeless as the monarchs who presided over most of it.

World War I and the Great Depression Marked the Breakdown of the Nation-State System of Governance

"World War I and the Great Depression marked the partial breakdown of this order. They showed that a system based on the notion of all-powerful, competing, national states simply would not work in an era of technological and economic interdependence. But this was not clearly seen at the time; instead, homeopathic remedies were applied: still more power to national states and governments and still greater isolation among them.

Internationalists Promoted Measures to Eliminate the Defects of the Nation-State System of Governance

"All this culminated in the catastrophe of World War II. In its wake, the West's prime concern was to avoid a recurrence of disasters to which the existing order had shown itself so prone: to fend off a postwar depression, and to deter another great war in the developed world. Wise and imaginative measures were directed to these ends. For the supreme crisis of the developed world came at one of those rare times when a fair number of men of unusual force and talent were at hand: Truman, Marshall, Acheson, Keynes, Monnet and Adenauer do not exhaust the list. As a result, the dangers which loomed so large in the developed world after 1945 diminished. Full employment was virtually attained; the threat of war among developed countries receded.

A Mechanism for Global Governance Was Established after World War II

"These successes were achieved in good part by innovations (the Marshall Plan, the International Monetary Fund, NATO and GATT) which recognized the bankruptcy of the old order and looked to new patterns of international action. But public understanding of this change was clouded. One reason was the dominant role of the United States; seen by some as simply a new variant of familiar hegemonical relations among nation-states, our influence both concealed and compensated for the structural deficiencies of the old order.

The Need for New Policy as the Postwar Era Passes

"Twenty years after the war, our unnaturally large role is being constrained in response to the revival of strength in other areas, some waning of the Soviet military threat, our domestic concerns and a growing awareness that American national power cannot solve every problem abroad. As our role diminishes, it becomes evident that other states are unable to meet, through national action, needs hitherto fulfilled by the United States. Thus, the passing of the postwar era underlines not only the need for new policy, but also the nature of the shifts which have been under way during that era in the developed world.

The Modern Industrial Nation-State Is Not Adequate to the Needs of the Day

"It is now clear that the modern industrial nation-state is simply not adequate to the needs of the day – that the most important problems confronting these states will no longer yield to the powers through which their governments have traditionally made their will prevail: the sword and the public purse. In the present environment, none of these governments can assure their purposes, unless their authority and power are increasingly supplemented from other sources: new forms of international action and increasing involvement of the private sector. An example of this is the widening awareness of limits on effective use of the American Government's power abroad and the growing realization that action by

even the most wealthy government, alone, cannot mobilize the external resources needed to aid growth in underdeveloped areas – whether in Asia and Latin America or in our own ghettos.

Traditional Notions of the Power and Authority of National Governments No Longer Command Allegiance

"Thus traditional notions of the power and authority of national governments no longer command – in the developed world at least – the allegiance that they did in times past. Symbols and slogans which derive from these notions are losing their force. Peoples grope for new concepts which will respond more directly to the needs of our day. The failure to find them as yet accounts for some of the unease and questioning which characterizes this transitional period.

The Concept of a Community of Nations

"Almost two years ago, in Warsaw, a philosopher suggested that the concept which would eventually replace past national slogans was that of 'community'. He was evidently using the term more loosely than the dictionary (which speaks of people living in the same place and under the same laws) to mean the coming together in common entities – without regard to national divisions – of people who have common purposes.

The Emergence of International Institutions Which Permit Like-Minded People to Direct Their Efforts to Common Ends Without Regard to National Sovereignty

"Of course, the concept of community is a vague one, but then many new ideas are vague when they first make their appearance. And perhaps the term 'community' is not the best way to describe this idea; its use risks confusion between the experience of the European Community and other quite different and less ambitious forms of joint action. But if we look to substance rather than semantics and for broad direction rather than detail, I suspect we will find the philosopher's judgment sound as to what the current transitional period presages: the increasing emergence of institutions which permit like-minded people to direct their efforts to common ends, without regard to traditional limitations imposed by the sovereign prerogatives of national governments.

International and Regional Institutions Are Moving into Areas That Traditionally Were Formerly the Responsibility of Nation-States

"Increasingly, just such institutions are moving into areas formerly thought the province of these governments. Some widen national boundaries, as in the case of the European Community – the best example; others, like the World Bank and regional development banks, reach out beyond them; still others, like the multinational corporations, ignore these boundaries, to tap private resources. The

strength and nature of these institutions evidently vary widely; the key point, in all cases, is that their scope is no longer defined or limited by old concepts of the power and authority of national governments. (One could make somewhat the same point about the domestic scene, where new institutions which are not tied to traditional notions of political authority arise to meet the problems of our cities.)

II

Recognition of the Current Transitional Period Should Play an Important Role in Determining Future American Foreign Policy

"...Recognition of these tendencies should play an important role in determining the future direction of American foreign policy – for the long term as much as for the next Administration.

The Need for a New Structure of Relations Which Will Facilitate Effective Joint Action Among Nations

"In the developed world, it should lead to a realization of the necessity for a new structure of relations which will facilitate effective joint action, and thus offer an alternative to past notions of national rivalry and hegemony. Building a solid core of power within this framework – that is, among the United States, Western Europe and Japan – is evidently the key to many of the actions discussed below – and to a good deal more besides. For such a structure will also help in shaping a sensible relation between the growing power which postwar change has generated in the developed world and the increasing turmoil which it portends in the developing countries....

III

National Sovereignty Is Not Likely to Figure as Prominently in the Future as in the Past

"...Traditional uses of national power by developed countries are not likely to figure as prominently in the future as in the past;...the U.S. role, in particular, is likely to decline; and...multilateral groups and cooperation offer the most promising – if still highly imperfect – way of filling the resulting vacuum....

IV

The Need to Converge the Economic Policies of the Trilateral Nations

"...The task for the developed world is thus one of concerting the sum total of its economic policies in respect not only of aid but also of trade, monetary policy and private investment – in ways which will create an environment congenial to growth in the developing, as well as the developed, world.

The Concept of a Community of Developed Nations Made Up of the United States, Western Europe and Japan

"Here is a task which can give substance to the concept of a community of developed nations made up of the United States, Western Europe and Japan. For only if these three industrial giants cooperate closely can the task be discharged.

Development of Joint Action and Joint Institutions Among the Trilateral Nations

"And it is hard to see how the West European nations can play their proper role in this concert, except as they come together increasingly in joint action and joint institutions.

A Decline in the Role of the U.S.

"In all of this, the *relative* U.S. role will surely wind down, for reasons that have been discussed. The day when the United States could or should provide the lion's share of aid, or meet most of the world's need for international liquidity, is clearly past.

Development of New Forms of International Action

"The new forms of international action which hopefully will replace it should be addressed to four purposes, whose fulfillment would permit increased resources to be transferred to developing countries without a difficult and dramatic expansion in traditional programs of bilateral foreign aid.

Global Redistribution of Income Through International and Regional Institutions

"(1) Providing increasing amounts of development assistance via multilateral aid institutions and programs: notably, the World Bank and its soft-loan affiliate (the International Development Association); consortia organized by the World Bank to deal with especially large and important needs (India and Pakistan); and regional development banks, *e.g.* in Latin America, Asia and Africa. These multilateral programs assure that the resources of many donor countries besides the United States are tapped and that these resources are combined with outside counsel, which is sometimes received with better grace from an international institution than from individual developed countries. Centering aid increasingly about the World Bank complex and regional banks also helps to put it on a long-term basis, since this is the only basis on which banking institutions can operate. Of course, the pace at which the United States can move toward reliance on multilateral programs will hinge on the willingness of others to contribute. Until and unless that willingness greatly expands, large parts of our aid will have to continue to move through bilateral channels.

Creating a Global Monetary System in Which International Decisions Dominate

"(2) Creating a monetary system in which international decisions, rather than those of the United States, fix the level of world reserves and from which the developing countries can draw substantial benefit. The Special Drawing Rights scheme agreed upon at Rio is a step in the right direction. Activating that system will not only mitigate recurring monetary crises in a period when other countries are no longer prepared unquestioningly to accept U.S. deficits and policies; it will also help to meet the developing nations' needs for additional resources.

Reducing World Trade Barriers by Joint Action of Trilateral Nations

"(3) Reducing world trade barriers and affording temporary preferential access for developing countries to the markets of industrial nations. Here, too, only joint action can be effective; no single industrial country could reduce its barriers without inviting a disproportionate invasion of its domestic market. The resulting transfer of net resources might not be as large as some developing countries expect by the attraction and stimulus of wider export opportunities could exert an effect on their economies which cannot be wholly measured in quantitative terms. It would not substitute for aid, but it could reinforce the effect of aid in bringing about needed structural changes, leading to more market-oriented and hence more efficient economies in the developing world.

Boundaries Between the Public and Private Sectors, as Well as between Nation-States Will Have to Be Breached as Efforts to Encourage the Flow of Private Investment Are Stepped Up

"(4) Stepping up efforts to encourage the flow of private investment (particularly in agro-industry) to developing countries. Boundaries between the public and private sectors, as well as between nation-states, will have to be breached; the requisite resources imply cannot be secured through governmental action alone. The notion that there is something wicked or exploitive in private foreign investment is coming increasingly to be recognized for the fiction that it is. There are opportunities for both developed and developing countries to find novel ways of encouraging it: guarantees, subsidies of interest rates, joint ventures, etc.

The World Bank's International Finance Corporation and the Private Multinational Corporations Are to Play a Large Role

"Two international institutions – the World Bank's International Finance Corporation and the private multinational corporation – have a large role to play. Along with this might go new measures to encourage and assist borrowing by the developing countries in the private capital markets of the developed countries.

New Forms of Public-Private Partnerships

"There is some parallel in all this to the domestic scene in the United States, where the limitations on national governmental action in fighting the problems of urban poverty, the role and relevance of private resources in meeting these problems, and the need for new forms of public-private partnership to this end are becoming increasingly accepted as the ideological myths of the 1930s fade away.

A Two-Phase Approach Toward Global Governance and Cooperation

"Each of these four purposes is of at least as much concern to developing as to the developed nations and cannot be achieved without their cooperation; a concert of developed countries arrogating to themselves the task of deciding what is good for the world economy would be not only politically counterproductive but economically ineffective. Cooperation will have to occur, first, between developed countries and the emerging regional economic groupings of developing countries, and, second, within global organizations that include both developed and developing countries: the World Bank, IMF, GATT and UNCTAD.

The Eventual Objective of Bringing the Soviet Union into a Global System of Governance

"Our eventual objective should be to see the Soviet Union and the East European nations also playing a constructive role in these international economic programs. This will be slow in coming, but over the longer term, perhaps the communists will learn – as we have – that the political advantage they seek through bilateral arrangements is short-lived and ephemeral.

Joint Action by the Trilateral Nations Rests on Creating a Political Base for Global Socialism

"The possibility of joint action by the United States, Western Europe and Japan to meet the needs of developing countries rests on the assumption that a more viable political base will be created in the developed world for continuing and growing transfers of resources to developing countries. This is an assumption whose importance is exceeded only by its optimism.

The Vatican and the World Council of Churches Jointly Create an Exploratory Committee to Further Redistribute Income

"A promising initiative now being taken in the developed world is the Exploratory Committee on Society, Development and Peace, jointly created by the World Council of Churches and the Vatican. This committee, which recently convened an international meeting in Beirut, will try not only to lay out proposals for action by the industrial countries to aid development, but also to create national and local constituencies in these countries to support such action. Economic

development aid so far has lacked an active grass-roots constituency. Who could do a better job of creating it than the churches?...

Alternative to National Action

"This article has tried to sketch some of the ways in which alternatives to national action can be applied at danger points where power in the developed world and turmoil in the Third World converge and interact. Much is already being done to give content to joint action in these fields, by throwing American support behind regional organizations, by channeling out aid through multilateral programs and by otherwise strengthening institutions which permit common action to be taken effectively. When the record of the last few years is reviewed in all of these respects, it will be found to be an impressive one.

New Types of International Action in the Next Phase of American Foreign Policy

"As the war in Viet Nam abates, we will need to go much further. Our instinctive aversion to innovation, except in times of evident and desperate crisis, may be overcome if we contemplate not only the specific actions that are needed but also the underlying reasons for that need: the 'nobler and deeper' causes of the present unease of which Teilhard de Chardin spoke and which he rightly attributed to the uncertainties generated by man's passage to new and larger forms of communal action. If we can thus understand better the era of transition through which we are passing, it may be easier to look beyond it to new types of international action in the next phase of American foreign policy." (*Foreign Affairs*, Vol. 46, No. 4, July 1968, pp. 699-702, 706-707, 708-711.)

A Transition from a System of Nation-State Governance to Global Governance

According to Henry Owen the world is currently passing through is a transition from a system of nation-state governance into a system of global governance where economic and political decisions are made by individuals operating at the international level. It is a transition from the Bretton-Woods System into a new international economic system fashioned by the concept of trilateralism.

The Nation-State and National Sovereignty Are Outdated

Henry Owen states that "it is now clear that the modern industrial nation-state is simply not adequate to the needs of the day." (*Ibid.*, p. 701.) Owens feels it is time to move from the individual nation-state into a community of developed nations. He states that the word "community" means "the coming together in common entities – without regard to national divisions – of people who have common purposes." (*Ibid.*)

The Evolution of International Institutions with Governmental Authority

Owen states that the current transitional period into global governance "presages...the increasing emergence of institutions which permit like-minded people to direct their efforts to common ends, without regard to traditional limitations imposed by the sovereign prerogatives of national governments." (*Ibid.*, p. 702.)

The Future Direction of American Foreign Policy

Owen notes that recognition of world order "tendencies should play an important role in determining the future direction of American foreign policy...." (*Ibid.*)

Development of Joint Programs and Policies by the Trilateral Nations

He claims that world order politics "should lead to a realization of the necessity for a new structure of relations which will facilitate effective joint action, and thus offer an alternative to past notions of national rivalry and hegemony. Building a solid core of power within this framework – that is, among the United States, Western Europe and Japan – is evidently the key...." (*Ibid.*)

The Decline of the U.S. as It Shares Power with Western Europe and Japan

Owen notes that the predominant role which the U.S. held in the previous world order or concert of powers will now be somewhat diminished as it shares "power" with Western Europe and Japan in the new emerging community of developed nations. He feels that "the U.S. role, in particular, is likely to decline...." (*Ibid.*, p. 706.)

Convergence of Economic Policies in the Trilateral Nations

Owen feels that this new trilateral concert of powers' main task will be "one of concerting the sum total of its economic policies – in respect not only of aid but also of trade, monetary policy and private investment." (*Ibid.*, p. 708.)

Economic and Political Decisions Should Be Made at the International Level

In other words he feels that economic and political decisions should be made at the international level by intergovernmental institutions or international institutions where leaders from the U.S., Western Europe and Japan formulate policy. Today such decisions are being made and formulated through the process of economic summitry.

Four Issues Facing the Trilateral Concert of Powers

Owens states that the new concert of powers should address itself to four purposes: (1) a call for redistribution of the earth's wealth; (2) creation of a single international currency for the world controlled by the International Monetary Fund; the IMF is currently evolving into a world central bank similar to the Federal Reserve System, except on a global level; (3) removing all nationalistic economic barriers to so-called "free trade"; (4) "stepping up efforts to encourage the flow of private investment...to developing countries." (*Ibid.*, pp. 709-710.)

Two Phases for Developing International Cooperation

Owen notes that "cooperation will have to occur, first, between developed countries and the emerging regional economic groupings of developing countries, and second, within global organizations...." (*Ibid.*, p. 711.)

The Eventual Merger of the Trilateral Concert of Powers with the Soviet Union

Owen feels that the eventual objective of the Trilateral powers (the U.S., Western Europe and Japan) is to merge with the Soviet Union and the East European nations that are also contributing to international economic programs.

The Creation of a Political Base for Global Socialism

Owen also states that the "possibility of joint action by the United States, Western Europe and Japan to meet the needs of developing countries rests on the assumption that a more viable political base will be created in the developed world for continuing and growing transfers of resources to developing countries." (*Ibid.*)

The Trilateral Political Party

A "political base" was established when Jimmy Carter, a member of the Trilateral Commission was elected President of the U.S. Similar political feats were accomplished in England, Germany, France and Japan when key trilateralists moved into high governmental positions.

An Era of Transition for the Earth

After referring to "man's passage to new and larger forms of communal action," (*Ibid.*, p. 712.), Owen ends with these words: "If we can thus understand better the era of transition through which we are passing, it may be easier to look beyond it to new types of international action in the next phase of American Foreign Policy." (*Ibid.*)

An Evolutionary Process Toward Global Governance

In his article Henry Owen was echoing a call for a new international system. He was not alone. Many others in governmental circles, business and the academic world also began to publicly announce that it was now time to begin the next phase or evolutionary step in a movement toward a global system of governance.

A Call for a New World Order

In 1973 Henry Owen served as the editor of a Brookings Institution Book entitled *The Next Phase in Foreign Policy*. In the introduction he echoes his earlier cry of 1968 for a new global system of governance. He stated:

"The men who gathered at Vienna in 1815 to restore the primacy of that state after the Napoleonic wars were skilled and successful, but they failed to understand the new forces unleashed by the political and industrial revolutions of their time. These forces ushered in an age of competitive and popular nationalism which overthrew the dynastic state and led to World War I.

A System of Nation-State Governance Will Not Work in an Era of Technological and Economic Interdependence.

"The statesmen of Versailles tried, like those at Vienna a century earlier, to put the world together again. They were less skillful and at least equally insensitive to the underlying trends that were transforming their age. The Great Depression marked the final breakdown of that age, showing that a system of all-powerful, competing national states simply would not work in an era of technological and economic interdependence. But again, this was not clearly seen at the time. Instead, homeopathic remedies were applied in the 1930s: still more power to national governments and still greater barriers between them. All this culminated in the catastrophe of World War II.

A Time of Major Transition for the Earth

"This is again a time of major transition. It is not merely that the coalitions and policies formed after World War II are eroding. The causes of transition go deeper; Teilhard de Chardin described the process when he spoke of the great unrest that springs from a nobler and deeper cause than the difficulties of a world trying to recover some ancient equilibrium it has lost: we are up against the heavy swell of an unknown sea; we are passing through an age of transition.

The Partial Breakup of the Old World Order

"Transition is a commonplace in history. But currently the term has special meaning. It reflects the partial breakup of a world order in which the nature of power and authority had seemed reasonably clear. Changes are at work in the

industrial and developing worlds which, though very different, now challenge that order.

People Have Looked to the Nation-State for the Last One Hundred and Fifty Years

"For the past century and a half, the peoples of the industrial world have looked to national states and governments to meet their security and economic needs, and to provide a set of values that would give meaning to their lives. Within the nation-state, they have seen central governments as the symbols of national identity and the fountainhead of power and legitimate authority. And among nation-states they perceived adversary and hegemonic relations that provided a congenial outlet both for the aggressive impulses described so well by Konrad Lorenz for animal species and for the collective pride that seems so highly and uniquely developed in humans.

The Modern Industrial Nation-State Is Simply Not Adequate to the Needs of the Last Third of the Twentieth Century

"In the last third of the twentieth century, however, it is becoming increasingly clear that the modern industrial nation-state is simply not adequate to the needs of the day: its reach is too short. And within these states some of the most important problems confronting their people will no longer yield to the powers through which national governments have traditionally made their will prevail: the sword and the public purse.

The Nation-State Has Come to the End of the Road

"This is most evident in the countries of Western Europe, whose governments are dwarfed by the problems with which they must cope. None of them pretends it can defend itself militarily against major attack. In the economic sphere, Rene Foch has observed, the presidents of some multilateral companies now deal on equal terms with heads of European states. Socially and culturally, the tug of subnational communities (Welsh, Scots, Basque) grows. John Galtung suggested that the nation-state, 'that impressive political structure that emerged out of events in the seventeenth, eighteenth, and nineteenth centuries, has in a sense come to the end of the road' and predicted that in 'Europe to be a national politician will have a tinge of the old fashioned, of the man who does not 'quite understand what the end of the twentieth century is about; like the blacksmith in an age of automobiles.'

Notions of Japanese Military Might and Autonomous Action No Longer Command Domestic Support

"Japan's power is more nearly adequate to its needs than that of any European nation; the difference between Japan and individual European countries in this respect is large and important. But Japan's security and economic prospects, too,

depend on circumstances beyond its control – notably U.S. policy and power – and this is widely perceived in Japan. Although the concept of a Japanese national community is still basic, notions of Japanese military might and autonomous action no longer command the domestic support they once did.

The Obsolescence of the Nation-State

"Even in the United States and the USSR – vast continental communities that are less vulnerable to the obsolescence of the nation-state than most industrial countries – traditional national power and authority are being questioned. Social and cultural revolution proceeds in each of these countries, though at widely differing rates and in very different ways. Institutions that formerly provided a stable framework for life – school and family – are changing. Young people are questioning values that have hitherto been accorded automatic assent, or at least questioning society's commitment to these values. As in other industrial societies, the elite have lost their self-confidence, or at least their ability to inspire confidence in others; the rationales that inspired or sanctioned their rule have lost much of their magic.

The Nation-State Will Function Very Differently in the Industrial World in the Last Third of the Twentieth Century

"All this suggests that the nation-state will function very differently in the industrial world in the last third of the twentieth century than it has in the past.

International Forces Such as Trilateralism Are Now Challenging the Nation-State

"Its domination of international relations will be challenged by new transnational forces.

International Institutions Are Emerging Whose Authority Does Not Stop at National Frontiers

"Institutions are emerging whose authority does not stop at national frontiers and whose constituencies reach beyond them. Some are global, like the World Bank and the International Monetary Fund; others are regional, like the European Community; still others are forerunners of a community of developed nations, like the Organization for Economic Co-operation and Development, whose role is expanding.

The Declining Importance of the Industrial Nation-State and National Sovereignty

"Paralleling these is a growing network of private groups and programs that cross national boundaries. The result is an untidy and eclectic pattern, but one that unmistakably reflects the declining importance of the industrial nation-state.

The Decline of the Nation-State and National Sovereignty Has Been Masked

"To some extent the decline has been masked by the outsize part the United States has played in world affairs since World War II. Unilateral U.S. action has met the needs of industrial nations – in defense, economic policy, and other areas. But it is becoming clear that this was an unnatural and short-lived phenomenon. The American people and the people of other developed countries are resentful, in different ways, of the asymmetrical burdens and responsibilities it has involved. Our role is shrinking, but the needs remain, and no other nation-state is strong enough to meet them.

The Question of Whether New Forms of Transnational Public and Private Action Will Emerge

"The question is whether new forms of transnational public and private action will emerge in time to fill the gap and prevent the industrial world from falling back into disordered patterns of interstate relations, which did not work too well in their heyday and are now hopelessly inadequate.

A Different Revolution is Occurring in the Developing Countries

"In the developing world a different revolution is a work. All historical analogies are imperfect, but there are at least two similarities between this revolution and the developed world's somewhat less abrupt entrance into the modern era two centuries ago. One is the dawning realization of peoples in developing countries that the physical environment can be changed for the better by human effort. Another is the raising of the nation-state, even as its primacy declines in the industrial world, to the highest place among popular symbols.

Two Forces Are at Work in the Developing Countries

"These two forces – nationalism and belief in progress – are working to unsettle the outlook and physical surroundings of a large part of the Third World's population, even as a like transformation of attitudes set the West off on its explosive course in the late eighteenth century. Conceivably these forces may work themselves out into new patterns of stability; however, there are many obstacles. For belief in progress, even among the elite, arouses in developing nations a mounting preoccupation with economic development, while the barriers to its fulfillment are formidable.

Growing Nationalism in the Third World Strengthens Autarkic Tendencies

"And growing nationalism not only spurs modernization; it also enlarges these barriers by strengthening autarkic tendencies and encouraging conflicts between nations.

The Problem Is Compounded by Population Increase and the Growing Number of Educated People

"The problem is compounded not only by population increase but by the growing number of educated people who are aware of the widening gap between living standards in the developed and developing world, and who are concentrated in overcrowded, potentially explosive cities where unemployment is rising at a frightening pace. Alastair Burnet put it well:

Calcutta may have 15 million people if life does not break down entirely in this decade; Buenos Aires may have 10 million; Cairo 6 million. And if the pace of industrial growth is not fast enough – and it is certainly not now – then it will be prudent to expect serious and bloody attempts at revolution there. What we are seeing from urban guerrillas in Latin America is only, I suspect, a beginning. It is the gloomiest prospect of all in this decade.

A Problem That Will Not Yield to Traditional Remedies

"Meanwhile, developed and developing nations alike will face a common threat: man's spoilage of the earth may make it an increasingly inhospitable environment. This is not primarily a matter of being unable to grow enough food, but rather of lacking the clean air and water and open spaces that have so much to do with the quality of life. Rats grow tense and nasty if crowded together; man may follow suit, if they do not first, quite literally, suffocate under the blankets of smog spreading over the Northern Hemisphere. Here too is a problem that will not yield to traditional remedies.

The Obstacles Posed by Inertia and National Parochialism

"All this suggests a need for new policies and for new forms of international cooperation in carrying them out. It is tempting to conclude that these policies will automatically come into being, that the obstacles posed by inertia and national parochialism will fade away in the face of evident need. But they will not. Long forgotten are not only statesmen who ignored change but observers who misjudged its pace. In the late nineteenth century, as economic growth and education seemed to be marching forward irresistibly, men succumbed to the illusion of perpetual peace and progress. But as the Swiss historian Jacob Christoph Burckhardt predicted at the time, all this only culminated in larger wars and more effective tyrannies. Burckhardt was thought insensitive to change and progress, just as were those who in the 1920s challenged the notion that the spread of democracy in

Western Europe after World War I ensured against a recurrence of war. Two decades later, a man brought to power by German universal suffrage invaded Poland for the oldest of reasons – to recover lost lands and peoples – and France and England entered the war for another ancient reason – to maintain the balance of power.

Basic Human Attitudes and Institutions Change Slowly

"Basic human attitudes and institutions change slowly. Deep-rooted shifts are at work, but it will be a long time before they achieve results.

Utilizing the Nation-State to Mobilize Large Resources

"In the developed world, the nation-state is still the most effective means for mobilizing large resources; and – at least in the United States, the USSR, and Japan – it still commands loyalty that can be translated into usable power. Even Western Europe, which has sought to organize itself regionally, remains divided into nation-states; the European Community has not replaced these states in key areas of decision making; and their relations with each other still reflect a traditional concept of status and prestige.

The Nation-State is Anachronistic

"That this concept is anachronistic does not make it disappear. Nor does its rejection by the young in many developed nations – they are not in charge of governments. And growing awareness that these nations face common problems – urbanization, pollution, and youth alienation – has not yet healed the divisions that keep them apart.

The USSR Still Envisages a Self-Perpetuating Monopoly of Political Power

"The innate conservatism of governments and dominant political forces in the industrial world is evident in both noncommunist and communist countries. Soviet leaders agreed to promising initiatives for bilateral cooperation with the United States at the 1972 summit meeting, but they still envisage a self-perpetuating monopoly of political power at home and unchanging dominion over their neighbors in Eastern Europe. They are not likely to join in multilateral ventures that might place these objectives in jeopardy.

Conservatism in the U.S., Western Europe and Japan

"In the United States, Western Europe, and Japan, conservatism is evident in other ways: it pits these great industrial areas against each other in economic conflicts that owe more to habits of thought developed by Jean Baptiste Colbert three centuries ago than to the emerging fact of interdependence.

The Attitudes of the Elite Who Have Traditionally Held Power in the U.S., Western Europe and Japan

"Progress in the developing world, too, is hobbled by attitudes and institutions that resist needed change. Attitudes of the elite, who have traditionally held power in these regions, and of the emerging intelligentsia are ill attuned to the requirements of economic growth. The international cooperation required to promote such growth will be even harder to achieve in the developing than in the industrial world: the nation-state is still on the ascendant in the Southern Hemisphere.

Success Hinges on Decisions Made by Effective Political Entities

"Economic growth will not, of course, turn back the threat of great damage to the earth, but neither will international Earth Days or UN resolutions. Success still hinges on decisions made by effective political entities, whether they are national governments or new international organizations with tangible powers.

New Needs Must Be Confronted in the Context of Ancient Institutions and Attitudes

"The basic point is this: although new trends generate new needs and problems, these must be confronted in the context of ancient institutions and attitudes. An old epoch is dying, but a new one has not yet come of age. The resulting conflict between changing needs and traditional means of meeting them runs through most of the chapters in this book [*The Next Phase in Foreign Policy*]. Although no attempt was made to prescribe their thrust, similar themes nonetheless emerge as a result of the underlying trends that the authors have had to take into account.

The Need for Close Relations between the U.S., Japan and Western Europe

"The need for close relations between the United States and the great industrial regions (Japan and Western Europe) in devising new approaches to the economic problems that should be the main focus of U.S. foreign policy in this decade.

The Need for a More Modest Definition of Our Security Interests and for Giving Greater Weight to Multilateral Means

"The need for a more modest definition of our security interests in the developing world, and for giving greater weight to multilateral means of advancing our long-term interest in the world's growth.

The Need for Patiently Seeking Common Interests with the USSR and China

"The need for patiently seeking common interests with the USSR and China, without expecting rapid or dramatic breakthroughs...." (The Brookings Institution, Washington, D.C., 1973, pp. 2-8.)

The Nation-State Is an Outdated Concept

It is evident that Henry Owen feels that "a system of all-powerful, competing national states simply would not work in an era of technological and economic interdependence." He states that "this is again a time of major transition." In fact he again notes that "we are passing through an age of transition." (*Ibid.*, p. 3.)

The End of National Sovereignty and Nationhood

This transition, as noted earlier, is the transition from a system of governance by individual nations to a system of global governance where decisions are made at the international level and simply transmitted downward for implementation. Mr. Owen is heralding the end of national sovereignty and nationhood as we have heretofore known it.

The Evolving Power of International Institutions

Mr. Owen continues: "In the last third of the twentieth century, however, it is becoming increasingly clear that the modern industrial nation-state is simply not adequate to the needs of the day; its reach is too short." (*Ibid.*) He goes on to state that "within these states some of the most important problems confronting their people will no longer yield to the powers through which national governments have traditionally made their will prevail...." (*Ibid.*, pp. 304.)

The Nation-State Has Come to the End of the Road

He then quotes John Galtung who suggested that the nation-state "has in a sense come to the end of the road." (*Ibid.*, p. 4.)

The Obsolescence of the Nation-State

Occasionally Mr. Owen refers to the "obsolescence of the nation-state" when he advances his world order policies for the future.

A New Role for the Nation-State in the Near Future

Owen feels "the nation-state will function very differently in the industrial world in the last third of the twentieth century than it has in the past." He states that the nation-states "domination of international relations will be challenged by new transnational forces." (*Ibid.*)

The Emergence of International Institutions with Governmental Authority

Owen notes that "institutions are emerging whose authority does not stop at national frontiers and whose constituencies reach beyond them. Some are global, like the World Bank and the International Monetary Fund; others are regional, like the European Community; still others are forerunners of a community of developed nations, like the Organization for Economic Cooperation and Development, whose role is expanding." (*Ibid.*, p. 5.)

The Foundation for a New World Order

What Mr. Owen has just told us is that there are international institutions such as the IMF and OECD now have sufficient power as to be immune to governance by individual nations. The foundation for global governance is in place and it is sufficiently strong that it is not limited by national frontiers. In other words it has power to enforce its will, even on the U.S.

The OECD Is a Forerunner of a World State

Organizations such as the OECD in Paris, according to Owen, are simply the forerunners of the new superstate or community of nations.

A Growing Network of Private Groups and Programs

Owen states that paralleling the development and strengthening of international institutions in preparation for global governance "there is a growing network of private groups and programs that cross national boundaries." Leading the flock of private organizations is the Trilateral Commission with headquarters in New York, Paris, and Tokyo. Other private groups include the Atlantic Institute for International Affairs in Paris, the Royal Institute of International Affairs in London, the Council on Foreign Relations in New York, the German Society for Foreign Policy in Bonn, the Atlantic Council of the United States in Washington, the NIKKO Research Center in Tokyo, etc.

The Foundation for Global Governance

Owen concludes that with the foundation for global governance which is now in place (the IMF, OECD, World Bank, GATT, BIS, Economic Summitry) the "growing network of private groups and programs...unmistakably reflects the declining importance of the industrial nation-state." (*Ibid.*)

A Gradual Transition into Global Governance

Owen feels that the transition into a system of global governance constitutes a "revolution," although the majority of the people in the U.S., Western Europe and Japan are totally unaware of the gradual transition from nation-state governance.

Today's Problems Require International Solutions

Owen states that the variety of problems facing the nations of the world "suggests a need for new policies and for new forms of international cooperation in carrying them out. It is tempting to conclude that these policies will automatically come into being, that the obstacles posed by inertia and national parochialism will fade away in the face of evident need. But they will not." (*Ibid.*, p. 6)

Owen feels that solutions to problems afflicting mankind can only be solved by a system of global governance with decisions and solutions emanating from the highest places.

Utilizing the Nation-State to Redistribute Income and Resources throughout the World

Owen continues: "In the developed world, the nation-state is still the most effective means for mobilizing large resources; and – at least in the United States, the USSR and Japan – it still commands loyalty that can be translated into usable power." (*Ibid.*, p. 7.)

A System of Global Taxation

Owen feels that because there is a lack of some system of global taxation for raising revenue the nation-state should continue to be used to generate "resources" for distribution throughout the world. After the total transition of the nation-state into a system of global governance perhaps the individuals will pay taxes directly to the U.N. or such international bodies as the IMF, OECD, World Bank, etc. (See Kingman Brewster, Jr., *Foreign Affairs*, April 1972, Vol. 50, No. 3, p. 413, for a global taxing scheme.)

Western Europe Is Still Not Organized under a Single Central Government

Owen next states: "Even Western Europe, which has sought to organize itself regionally, remains divided into nation-states; the European Community has not replaced these states in key areas of decision making; and their relations with each other still reflect a traditional concept of status and prestige. That this concept is anachronistic does not make it disappear." (*Ibid.*)

The Nation-State Is a Hindrance to Global Government

Once again Owen states that the nation-state is "anachronistic" and a hindrance to the development of a new world order.

Soviet Leaders Are Not Ready at Present to Join the Concert of Powers

Owen feels that the "innate conservatism of governments and dominant political forces in the industrial world is evident in both noncommunist and communist countries." (*Ibid.*)

Sharing of Power in the Evolving Global System

The elite which governs Russia and China have not attained sufficient maturity to merge with the concert of powers into a system of global governance – "they still envisage a self-perpetuating monopoly of political power." (*Ibid.*) Since power would have to be shared in the concert of nations, Russia at this stage is not yet prepared for merger. However, they are slowly being drawn into the new international economic system through international trade, finance, etc. According to Owen it is only a matter of time and patience until the elite in Russia and China decide to enter the evolving global system of governance. At that time there will be only one economic system on the planet instead of the two which exist at this time.

Conditioning the People to Think Interdependently Instead of Independently

Owen notes that in "the United States, Western Europe, and Japan, conservatism is evident in other ways: it pits these great industrial areas against each other in economic conflicts that owe more to habits of thought developed by Jean Baptiste Colbert three centuries ago than to the emerging fact of interdependence." (*Ibid.*) It is, therefore, necessary for new ways of thinking to occur in the trilateral nations. People in these areas are now being encouraged to think interdependently. Television, journals and magazines have followed the tune played by the trilateralists and others so that today almost everyone is thinking interdependently, instead of independently.

The Developing World Is Hobbled by Traditional Attitudes and Institutions

Owen states that "progress in the developing world, too, is hobbled by attitudes and institutions that resist needed change. Attitudes of the elite, who have traditionally held power in these regions, and of the emerging intelligentsia are ill attuned to the requirement of economic growth. The international cooperation required to promote such growth will be even harder to achieve in the developing than in the industrial world; the nation-state is still on the ascendant in the Southern Hemisphere." (*Ibid.*)

Obstacles to a New World Order

According to Mr. Owen the nation-state is a hindrance to developing a new world order. Besides the problem of the nation-state, the elites who govern the developing world have not yet reached sufficient maturity, in world order political

and economic thinking, to share power or to be subordinate to a system of global governance.

Economic Growth Depends Upon Effective Political Entities

Owen feels that economic growth or free trade "still hinges on decisions made by effective political entities, whether they are national governments or new international organizations with tangible powers." (*Ibid.*, p. 8.)

Confronting New Needs in the Context of Ancient Institutions and Attitudes

According to Owen: "The basic part is this: although new trends generate new needs and problems, these must be confronted in the context of ancient institutions and attitudes. An old epoch is dying, but a new one has yet come of age. The resulting conflict between changing needs and traditional means of meeting them runs throughout most of the chapters in this book [*The Next Phase in Foreign Policy*]." (*Ibid.*)

A Great Conflict Is Occurring Between the Forces of Global Governance and the Advocates of Nation-State Governance

Owen has given the reader a very important key in this passage: the great conflicts occurring throughout the world are between the forces favoring the more traditional system of nation-state governance. The importance of this statement should not be overlooked. The agents of the rich industrial powers or concert of power are gaining the upper hand as the new international system unfolds. The conflicts can be observed on the front pages of nearly every newspaper. However, persistence is one of the greatest traits of those who favor global governance. Power, prestige and wealth are currently the aces which the agents of world order politics hold against the communist and developing countries.

The Emergence of Similar Themes in Owen's Book

Owen notes that "similar themes, nonetheless, emerge as a result of the underlying trends that the authors in *The Next Phase in Foreign Policy* have had to take into account...." The similar themes are:

"The need for a more modest definition of our security interests in the developing world, and for giving greater weight to multilateral means of advancing our long-term interest in that world's growth.

"The need for patiently seeking common interests with the USSR and China, without expecting rapid or dramatic breakthroughs." (*Ibid.*)

The Main Focus of U.S. Foreign Policy in the 1970s

In other words, the main focus of the 1970s in U.S. foreign policy was to launch trilateralism and to deepen trilateral ties with Russia and China as they slowly make the transition to global governance in the evolving new world order.

The Age of the Nation-State Is Drawing to a Close

In the conclusion to *The Next Phase in Foreign Policy*, Owen writes:

"The world order that existed before 1914 has been destroyed by a half-century of war and revolution. It has been suggested in this book that in the industrial world, at least, the age of the nation-state is drawing to a close. The question is, What will take its place – an era of intermeshing private and public international communities or a world of polyarchic disorder? The United States has a substantial interest in the outcome.

The Dream of the Founding Fathers Is Gone

"The day when Americans could speak, as John Adams did, of producing a grand design that would illuminate the future of mankind is gone. We have learned that it is hard enough to grapple with our own problems without trying to guide and instruct others; our main object in the 1970s will be to shape our own institutions and way of life. Foreign policy will be successful if it enables us to do just this, free from external threats and pressures.

The U.S. Needs to Join the Concert of Power

"These are parochial goals, but they cannot be achieved by parochial courses of action. America's involvement in the world is now so large that neither its peace nor its freedom to shape its own future can be assured unless it joins others in trying to create an environment in which certain pressing international needs can be met effectively.

The Chief Objective of U.S. Foreign Policy in the Post-Cold War Era

"Immediately after World War II, when East-West problems were dominant, these needs were most evident in the security field; and they were met, at least in part, unilaterally by the United States. In the seventies, the focus will shift to economic needs within the noncommunist world, and these will have to be met multilaterally as our unilateral role diminishes. Helping to create a world order in which international action for this purpose can be mounted should be a chief objective of U.S. strategy in the post-cold war era we are now entering. This chapter tries to summarize that strategy in relation to the regional and functional areas discussed earlier in the book.

Mobilizing Multilateral Cooperation

"The United States will have to be innovative to advance this strategy, since the obstacles to early European or Japanese action are large. Innovation will only be effective in mobilizing multilateral cooperation, however, if it incorporates heightened regard for the attitudes and interests of other nations. Nowhere is this need more evident than in our relations with other industrial regions.

The United States, Western Europe, and Japan Should Form a New Concert of Power

"Western Europe and Japan are where the power is. Outside the United States, only these areas of the noncommunist world have the capital and technology to create great economic and military strength. Rifts between them and the United States could damage the attempt to meet important international needs beyond repair. Without concert among industrial regions on aid and other economic policies toward developing countries, progress in the Third World would be slowed. If Europe and Japan refused to cooperate in trade and monetary reform, such reform would be impossible to achieve; many countries, including the United States, could suffer economic damage. More seriously if less probably, should Japan be moved by growing alienation from the United States to rely increasingly on national means to assure its security, peace might be threatened in Asia; transatlantic disputes and resulting disorder in the Atlantic world could revive Soviet ambitions and prejudice the stabilization of East-West relations in that area.

Economic Relations with Western Europe and Japan

"Whether Europe and Japan become alienated from the United States will depend on how economic issues that affect the interests of large and powerful domestic groups are handled.

Conflicts between the Forces of Global Governance and the Advocates of National Sovereignty Will Grow

"As suggested in Chapter 9, two contradictory impulses will govern economic relations among the industrial countries. On the one hand, the logic of their economic interdependence will grow, increasing the need for joint programs and institutions to meet common economic problems. On the other hand, the fact of political national independence will remain; parochial national attitudes and interests show few signs of withering.

Tension Between the Forces of Economic Interdependence and Political Independence Will Focus on Three Main Areas

"Continuing tension between these two impulses – toward economic interdependence and political independence – will focus on three main areas.

Conflict Over Monetary Policy

1. *Monetary policy.* The differing domestic economic policies that industrial countries pursue will periodically produce the need to alter the relation between their currencies. Under present arrangements, as the monetary crises since August 1971 makes very clear, such shifts can be accomplished only with difficulty and at some political cost. This poses special problems for the United States because of the global role of the dollar. These problems will persist and recur until (1) some means of adjusting exchange rates more flexibly and frequently is agreed upon by the principal industrial nations; and (b) the International Monetary Fund (IMF) or some other international institution is endowed with the attributes of a central bank, and an international unit of account is substituted for the dollar as the principal reserve currency of the noncommunist world.

Conflict Over Trade

"2. *Trade.* As the developed nations' economies tend to merge, barriers to trade among them are increasingly anachronistic. But these barriers were erected by politically powerful and economically vulnerable domestic interests and will not be easy to break down. Indeed, there is some risk that they will be strengthened as growing international trade becomes a threat to inefficient domestic industries. Resulting trade wars among the developed countries might not greatly retard their economic growth, but they would surely create political tension. In this situation, the advice of a British World War II infantry manual is sound: the best way to avoid mortar fire is to go forward. The object of a new round of global trade negotiations should be to reduce tariffs among the developed countries to zero over a ten-year period and to reduce nontariff barriers to manageable proportions. Success in this effort will require that the United States and other industrial countries devise some effective means of providing adjustment assistance to the domestic interests most directly affected.

Conflict Over Agriculture

"3. *Agriculture.* A major trade problem is that the industrial world produces a good deal more food than it can consume or export at prices that would not disrupt world markets. The problem is complicated by the political importance of farmers in most of these countries. It cannot be solved by any single industrial country or by negotiations between such countries that do not result in large changes in their domestic policies. The object should be to secure agreement among major industrial countries on domestic support and adjustment policies that provide for long-term shifts of people and resources out of agriculture into more rewarding fields. The obstacles to an international negotiation for attaining this goal are immediately evident.

Bending the Political Prerogatives of the Nation-State to the Economic Needs of Interdependence

"The chief business of the developed countries in this decade – aside from the provision of aid to poor nations – will be to address these three economic problems. Bending the political prerogatives of the nation-state to the economic needs of interdependence will require that the larger political considerations involved be brought to the attention of the public.

The Role of Economic Summitry

"This is more likely to occur if negotiations can be launched with a powerful political impulse involving the active participation of heads of government.

The 1950s and 1960s Were Dominated by the Objective of an Atlantic Partnership Between North America and the EEC

"Such an impulse will be easier to generate if there is a shared perception of long-term goals. Lord Acton was not far wrong when he spoke of that remote and ideal object that captivates the imagination by its splendor and the reason by its simplicity and that thus evokes an energy which could not be generated by less, more proximate goals. In the fifties and sixties, that remote and ideal object was seen as an Atlantic partnership between North America and a uniting of Western Europe.

The 1970s Were Dominated by the Goals of Trilateralism

"In the seventies, it should be thought of as a trilateral relation between the United States, Western Europe, and Japan. Our stake in a workable connection with Western Europe is as great as ever, as is our stake in the greater unity that would enable Western Europe to act more effectively; but it is clear that many of the problems confronting the United States and Europe cannot be resolved except in a larger framework, which includes Japan.

The Need for Programs, Arrangements and Institutions to Bring the Trilateral Nations Together for Joint Action

"The need will be not for a supergovernment that places these three industrial areas under some formal structure, but rather for a wide variety of arrangements, programs, and institutions that bring them together for joint action in meeting common problems. In these, Canada should surely join.

The Result of Trilateralism Is a New World Superstate or Community of Developed Nations

"The resulting community of developed nations need not be a rich man's club. In close concert, these nations could not only maintain their own prosperity and security, but also work more effectively with developing countries to implement policies that would hasten growth in the developing world.

Efforts to Draw the USSR and the Nations of Eastern Europe into the New Concert of Powers

"Nor should this community develop into an anticommunist coalition. Efforts should be made to draw the USSR and the nations of Eastern Europe into its cooperative ventures.

The Structure of Relationships for Political-Military Fields

"Pressing issues in the political-military field will interact with the economic issues described above and will have to be addressed by the industrial countries. These political-military issues...run bilaterally between the United States and Western Europe and the United States and Japan, rather than trilaterally among the three industrial regions, as in the economic field....

Trilateralism Contains a Coherent Set of Goals and a Long-Term Strategy

"The specific courses of action suggested in this chapter [the conclusion] may be outrun by events or otherwise made obsolete, but the general concepts should endure. They are the heart of the matter. For it will be difficult to accommodate to accelerating world changes unless we have a coherent set of goals and a long-term strategy for attaining them. Failing this, the United States will be drawn into a succession of ad hoc responses to new problems which will add up to holding actions at best and to mutually offsetting and contradictory measures at worst. In a period of diminishing U.S. influence, it will be more important than ever to have a clear sense of the priorities that should govern its use:

Creation of a Community of Developed Nations Should Be Our First Order of Business

"Creation of a working community of developed nations, which would include the United States, Western Europe, and Japan, should be our first order of business. The economic field is where such a community is most likely to take form. Global negotiations to deal with growing interdependence in trade, monetary policy, and agriculture should be pursued to this end.

Redistributing Income and Resources Should Be a High Priority Task of This Community

"The transfer of substantial resources from rich to poor nations through multilateral programs and institutions and through sensible trade policies should be a high-priority task of this community. It is one of the few ways in which useful action can be taken to reduce the risks of growing violence and chaos in the developing world. By contrast, it is difficult to foresee contingencies in which deployment or use of U.S. military power in that world will make sense: our vital security interests there are limited to the Caribbean, Israel, and Northeast Asia.

The USSR Could Eventually Play a Role in the Community of Developed Nations

"The United States should persist in the effort to find and act on interests that it shares with the Soviet Union and China. Success will hinge on our ability to keep at it over a long period of time, despite the natural tendency to vacillate between extremes of hostility and euphoria. Progress in building a working community of developed nations, in which the USSR could eventually play some role, may hasten success in this effort if we do not allow ups and downs in East-West relations to divert attention from this central task...." (*Ibid.*, pp. 309-313, 329-330.)

The Age of the Nation-State Is Drawing to a Close

In the above quoted material, Mr. Owen states that the book, *The Next Phase in Foreign Policy*, suggests "that in the industrial world, at least, the age of the nation-state is drawing to a close." He asks a very pertinent questions: "What will take its place...." (p. 309.)

The End of the American Dream

Owen concludes that the "day when Americans could speak, as John Adams did, of producing a grand design that would illuminate the future of all mankind is gone." (*Ibid.*) He feels that:

"In the seventies, the focus will shift to economic needs within the non-communist world, and these will have to be met multilaterally as our unilateral role diminishes. Helping to create a world order in which international action for this purpose can be mounted should be a chief objective of U.S. strategy in the post-cold war era we are now entering." (*Ibid.*)

Where the Power Lies on the Earth

Owen also states: "Western Europe and Japan are where the power is.... Without concert among industrial regions on aid and other economic policies

toward developing countries, progress in the Third World would be slowed." (*Ibid.*, p. 310.)

The Two Impulses Which Will Govern Economic Relations

He feels that "two contradictory impulses will govern economic relations among the industrial countries. On the one hand, the logic of their economic interdependence will grow, increasing the need for joint programs and institutions to meet common economic problems. On the other hand, the fact of political national independence will remain; parochial national attitude and interests show few signs of withering." (*Ibid.*) In other words, there will continue to be conflict with the forces who favor global governance and those who favor nation-state governance, at least for the foreseeable future.

Trilateral Monetary Policy

In discussing monetary policy, Owen feels that problems will continue until "(a) some means of adjusting exchange rates more flexibly and frequently is agreed upon by the principal industrial nations; and (b) the International Monetary Fund (IMF) or some other international institution is endowed with the attributes of a central bank, and an international unit of account is substituted for the dollars as the principal reserve currency of the non-communist world." (*Ibid.*, p. 311.)

A Significant Step Toward Global Governance

What Mr. Owen is proposing is a significant step toward global governance inasmuch as he is proposing that the IMF become the world's central bank. He is also proposing a single international reserve currency for the non-communist world.

Trade Wars

In discussing trade matters, Mr. Owen feels that "trade wars" might occur in the 1970s as "growing international trade becomes a threat to inefficient domestic industries." (*Ibid.*)

The Object of the Multilateral Trade Negotiations

Owen notes that the "object of a new round of global trade negotiations should be to reduce tariffs among the developed countries to zero over a ten-year period and to reduce nontariff barriers to manageable proportions." (*Ibid.*)

Owen Calls for a Reduction in Food Production

In reference to agriculture Owen notes that a "major trade problem is that the industrial world produces a good deal more food than it can consume or export at

prices that would not disrupt world markets." (*Ibid.*) He feels that industrial nations should discontinue producing more food than they consume. He states that the main objective "should be to secure agreement among major industrial countries on domestic support and adjustment policies that provide for long-term shifts of people and resources out of agriculture into more rewarding fields." (*Ibid.*, pp. 311-312.)

A Call for Implementing Economic Summits

Mr. Owen next calls for the implementation of what we now term "economic summits."

"Bending the political prerogatives of the nation-state to the economic needs of interdependence will require that the larger political considerations involved be brought to the attention of the public. This is more likely to occur if negotiations can be launched with a powerful impulse involving the active participation of heads of government.

"Such an impulse will be easier to generate if there is a shared perception of long-term goals." (*Ibid.*, p. 312.)

The First Economic Summit at Rambouillet

What Mr. Owen proposed became a reality in 1975 with the inauguration of the first economic summit at Rambouillet. Each year the heads of the leading industrial nations have met at an economic summit to formalize joint action and programs for the trilateral nations. The summits will be discussed shortly.

Trilateralism – The Beginning of a New Era in U.S. Foreign Policy

Mr. Owen next pronounces the end of Atlanticism and announces the beginning of a new era in U.S. foreign policy – the era of trilateralism.

"In the fifties and sixties [the] remote and ideal object was seen as an Atlantic partnership between North America and a uniting Western Europe. In the seventies, it should be thought of as a trilateral relation between the United States, Western Europe and Japan." (*Ibid.*)

The Role of Economic Summitry

He next announces the purposes or role which economic summitry was to play.

"...Many of the problems confronting the United States and Europe cannot be resolved except in a larger framework, which includes Japan. The need will be not for a supergovernment that places these three industrial areas under some formal structure, but rather for a wide variety of arrangements, programs, and institutions

that bring them together for joint action in meeting common problems. In these, Canada should surely join." (*Ibid.*)

Institutionalization of Supra-National Government

The institutionalization of economic summitry took place at the London summit in 1977 with the assistance of Henry Owen. He stated that the "resulting community of developed nations need not be a rich man's club." He feels that the trilateral nations by working in "close concert...could not only maintain their own prosperity and security, but also work more effectively with developing countries to implement policies that would hasten growth in the developing world. Nor should this community develop into an anti-communist coalition." (*Ibid.*)

A Merger of East and West into a New Global System of Governance

Owen states that Russia and the former COMECON nations should be drawn into the new global system: "Efforts should be made to draw the USSR and the nations of Eastern Europe into its cooperative ventures." (*Ibid.*)

The Emergence of a Powerful New Superstate

Once we have merged the U.S., Western Europe (EEC), Japan, the USSR and the COMECON nations into one "international system," Mr. Owen feels that this powerful new super-state will be able to persuade the third world – the developing countries – to follow their joint policies and programs without opposition. Today the developing nations are jointly calling for a "new international economic order," which is somewhat different from the trilateral plan for a new international economic system.

A Key to Understanding U.S. Foreign Policy in the 1970s

In order to understand U.S. Foreign Policy in the 1970s, the reader should carefully study *The Next Phase in Foreign Policy* inasmuch as the key authors in this book moved into high positions within the Carter Administration. Their common policies and programs were advanced and implemented. In fact, many of the Carter Administration policies were previously outlined in the book. Editor Henry Owen has noted:

"The specific courses of action suggested in this chapter [the conclusion] may be outrun by events or otherwise made obsolete, but the general concepts should endure. They are the heart of the matter. For it will be difficult to accommodate to accelerating world changes unless we have a coherent set of goals and a long-term strategy for attaining them." (*Ibid.*, p.329.)

A Coherent Set of Goals and Long-Term Strategy Dominates the Carter Administration

Perhaps no other administration was better equipped with a set of concrete plans, ideology and power to accomplish a set of specific goals – the goals of trilateralism – than the Carter Administration. Indeed it had "a coherent set of goals and a long-term strategy for attaining them."

The Core Philosophy of Trilateralism

The goals set forth by Owen (*Ibid.*, pp. 329-330) of creating a community of nations, transfer of resources to the third World and seeking greater degrees of cooperation with China and the Soviet Union formed the basic core philosophy of what was soon to become known to the world as trilateralism.

The reader should recall that Mr. Owen's statements were made in 1968 and 1973. His views are shared by his colleague, Zbigniew Brzezinski, who in 1970 also outlined the new philosophy which was to become known as "trilateralism." (See Brzezinski's book *Between Two Ages – America's Role in the Technetronic Era.*) The philosophy of trilateralism was also expounded by David Rockefeller at the Bilderberg meetings in 1972 at Knokke, Belgium.

III. The Role of Economic Summitry: To Institutionalize Trilateralism

With a philosophical groundwork for trilateralism laid it was then time to institutionalize the new concept. This was accomplished when the Trilateral Commission was organized in 1973 with the headquarters in New York, Paris and Tokyo. Dr. Zbigniew Brzezinski became its first director and served in this capacity till he entered the Carter Administration. Henry Owen, in the meantime, was at Brookings where the institution set up what was to become a series of tripartite studies with authors coming from the U.S., Western Europe and Japan.

Tripartite Studies at the Trilateral Commission and at Brookings

The Trilateral Commission began a series of tripartite studies also and they became known as the *Triangle Papers* was to allow authors from different countries to begin examining problems with a global perspective instead of through the eyes of the traditional nation-state.

Accustoming the Ruling Elites to Working Together

The Trilateral Commission began holding meetings of its membership which consisted of the ruling elites from the U.S., Western Europe and Japan. This high powered Commission was attempting to accustom people to working together first in a private setting. After four years of such meetings key individuals were now ready to begin moving further toward global governance.

Members of the Trilateral Commission in the White House

Fortunately, for the Trilateral Commission, Jimmy Carter, a member since 1973, was elected President of the U.S. He then took with him a goodly portion of the Trilateral team into the White House. These include Mondale, Vance, Brzezinski, Brown, Cooper, Gardner, Owen, etc. Members of the Commission had accepted the idea of a need for the convergence or harmonization of the economics of the western industrial nations. A number of important publications had outlined the need for greater international cooperation between the United States, Western Europe and Japan. These reports included Miriam Camp's study for the Council on Foreign Relations in New York entitled "The Management of Interdependence" (1974); the Atlantic Council's of Washington study entitled "Beyond Diplomacy" (1975); two reports of the Trilateral Commission in New York entitled "The Problem of International Cooperation" (1976) and "The Reform of International Institutions" (1976); and the Atlantic Council's study entitled "Harmonizing Economic Policy: Summit Meetings and Collective Leadership" (1977).

The Foundation Was Laid for Further Evolution Toward Global Governance

These studies laid the foundation for international cooperation in the 1970s and 1980s. Several of the reports called for the establishment and strengthening of the institutional mechanism known as economic summits.

The Trilateral Commission Report Calls for Convergence of Economic Policy

"The Crisis of International Cooperation," a Trilateral Commission document written in 1973 by three highly influential academics – Francois Duchene, Director of the International Institute of Strategic Studies in London; Kinhide Mushakoji, Director of the Institute of International Relations for Advanced Studies on Peace and Development in Asia (Tokyo); and Henry D. Owen, Director of the Foreign Policy Studies Program at the Brookings Institution in Washington, D.C. – called for the establishment of an intergovernmental mechanism to facilitate convergence of the economics of the U.S., Western Europe and Japan.

A Call for Changes in the Present Structure of Decision Making

The report called for "changes in the structures of decision making" within the nation-state apparatus. (*The Crisis of International Cooperation*, New York: The Trilateral Commission, 1973, p. 35.) The rapporteurs are hopeful that "mankind can muster the political will to manage common problems collectively." (*The Crisis of International Cooperation*, p. 36.) In other words they are hopeful that mankind will now move into a state of global governance. They feel that international cooperation has developed furthest among the advanced "industrial societies, especially North America, Japan and Western Europe" and "that cooperation between the industrial democracies [is] central to the future world system." (*The Crisis of International Cooperation*, p. 37.)

The International System Now Requires Common Management

Duchene, Mushakoji and Owen have stated that the international economic system must be thoroughly renovated.

"The system must either be reformed or founded in a rebirth of economic nationalism. Simply stated the problem is a structural one.

"The international system, which depended heavily on U.S. leadership and sustenance, now requires a truly common management to which North America, the European Community and Japan must – in view of their large economic power – make a special contribution. For the United States, this means a sense of loss of power because decisions have to be shared more than in the past; for the European Community and Japan it means a sense of burden, because new responsibilities have to be assumed and, in some cases paid for.

"For all three, the shift from a leadership system to one of genuine collective management, involving not only the three main industrial market economies but other countries as well, calls for what Robert Frost called 'the courage to be new.'" (*The Crisis of International Cooperation*, p. 40.)

Leading Industrial Nations Are Being Guided into a System of Global Governance

What Duchene, Mushakoji, and Owen have just stated is that the leading industrial nations are being guided into a system of global governance. The United States, Japan, England, France, Germany, Canada, and Italy are to be managed by international institutions and inter-governmental mechanisms. The IMF, OECD and Economic Summits will play a key role in global management of the western world. Eventually Russia, China and other Eastern nations are to be drawn into the new international economic and political system.

The Loss of National Sovereignty

Concerning the loss of national sovereignty, Duchene, Mushakoji and Owen note:

"In a world where economic interchange are increasingly international but responsibilities are national, each government, and even each legislature, experience the new development as a loss of control. In its efforts to ward off external complications a government tends, at least in part, to take defensive measures – which export them back to the outside world, that is, to the other participants in the system. Not surprisingly, the level of confrontation rises to the detriment of the general interest.

"This loss of national sovereignty, painful to each society and government individually, must lead in one of two directions in an interdependent system which is unlikely to break up. Either there will be progress toward international cooperation or dealing with the symptoms rather than the underlying disturbances, national governments will seek to exploit the so-called 'asymmetrics' of the situation." (*The Crisis of International Cooperation*, p. 42.)

A Loss of Power and Control by National Governments and Legislature

According to Duchene, Mushakoji and Owen, as we move from a system of nation-state governance to a global system of governance each government and legislature will lose power and control over its decision-making capabilities, at least in certain areas. When this loss of control occurs the individual nations in an attempt to maintain their national sovereignty will take defensive measures such as raising tariffs or refusal to comply with decisions made at the international level. The loss of national sovereignty of each nation will lead either to greater international cooperation or exploitation of the international system by individual, national governments. The end result will be conflicts on every continent in the world.

Conflicts Throughout the World

The conflicts that we see occurring today throughout the world are clashes between the forces of global governance and the forces of nationalism.

A Complicating Problem in the Smooth Operation of the International Economic System

The authors state that a "complicating problem" in the smooth operation of the international economic system "is the increasing involvement of public authorities, national and regional, in the whole economic process." They feel that as "the partial replacement of Economic Man by the Welfare Society progresses, there must be some collective arena for confronting the consequences of the economic and social policies of national governments...." (*The Crisis of International Cooperation*, p. 42.)

The Collective International Arena

The "collective arena" appears to be the OECD, the IMF, the World Bank, BIS, Economic Summits, etc.

The Need for New International Economic System

The authors exclaim that the "world has outgrown the postwar monetary system and this has produced considerable confusion on the international exchange markets." (*The Crisis of International Cooperation*, p. 46.) They feel "the present

system of flexible exchange rates must be improved, that the nations should be prevented from attaining national self-sufficiency under a new guise." Efforts should be made to "reinforce recent moves toward a managed international currency" – the SDR's. The third world countries should be placated by providing "the less developed countries with the more abundant multilateral finance from the advanced industrial societies which they need." (*The Crisis of International Cooperation*, p. 47.)

Planetary Humanism Offers the Only Common Goals for Societies

The three authors feel that "in the last resort, a 'planetary humanism,' to use Zbigniew Brzezinski's phrase, offers the only common goals for societies as diverse as those of the advanced industrial democracies." (*The Crisis of International Cooperation*, p. 48.)

Instituting Planetary Humanism through Common Management of the World

"In a crowded world," they noted, "the goals of planetary humanism must be sought through the rules, institutions, and contracts of common management." (*The Crisis of International Cooperation*, p. 49.)

A Call for a Permanent Economic Summit Preparatory Committee

In the concluding part of the report on "The Crisis of International Cooperation," authors Duchene, Mushakoji and Owen called for greater trilateral cooperation through collective action. It is in this section that they call for a permanent preparatory committee made up of individuals from the trilateral nations who could work behind the scenes in formalizing joint economic policies and programs to be implemented by the individual nation-states. Joint decisions could then be popularized and publically promoted after they had already been reached at the economic summits. The authors feel that the GATT and OECD are the right places for "formal cooperation."

Creating a Consensus Behind the Scenes

Duchene, Mushakoji and Owen feel the "problem is not to implement a consensus on policies, but to create one." Creating a consensus must be arranged behind the scenes through meetings between finance ministers, treasury and state officials and central bankers in the trilateral nations. That is why the media occasionally makes a short statement about "secret meetings" of finance ministers and others in Paris, etc. (See the *Wall Street Journal*, February 13, 1978.) The three authors note:

"...The formal launching of ideas on an official stage would be a mistake: it would expose them (joint ideas, policies and programs) prematurely to a mode of formal bargaining between governments without laying any of the political bases

for their acceptance. What is most urgently needed is an informal process of collective self-education (an economic summit preparatory group) to generate the joint perspectives from which joint policies can spring. Such a process (economic summits) must be public, creating awareness of the need for international initiatives on international problems." (*The Crisis of International Cooperation*, p. 52.)

The Final Objective Is Collective Action by the Trilateral Nations

Duchene, Mushkoji and Owen state:

"Of course, the final aim must be collective action by governments and eventually it should be possible to formalize consultation among them. It might, for instance, be possible to conceive of an international Advisory Commission of, say, three internationally respected statesmen with sufficient prestige to state the general interest, clarify the political stakes, and pave the way for the domestic acceptance of concession and compromise. But the time for this has not yet come." (*The Crisis of International Cooperation*, p. 52.)

Institutionalization of a Preparatory Group at the London Summit

The formalization or institutionalization of a preparatory group, or consultative body, occurred at the London summit of 1977, four years later.

Global Management Cannot Be Limited to National Governmental Leaders

The authors exclaim that "leadership in such matters [global management or governance] cannot be limited to politicians and bureaucracies whose responsibilities are rooted in historic systems [i.e. constitutional government] which are institutionally separate from one another [separation of executive and legislative branches of government] and who are ill-prepared by their training and loyalties to deal with transnational issues." (*The Crisis of International Cooperation*, p. 53.)

Private Citizens Should Participate in Global Governance

The authors conclude that leadership "cannot be exercised without them, but it need not be generated by them alone." They feel that "private citizens...should point to new opportunities and risks, and suggest new political directions." (p. 53.) Duchene, Mushkoji and Owen announced:

"It is in this spirit that the Trilateral Commission with participants from North America, Japan and the European Community, has been set up to propose jointly considered contributions by their nations to the major international issues the confront mankind. The Trilateral Commission will consider and publish studies which illuminate these issues, and it will publish policy papers which reflect its

members' views on, among other things, money, trade, resources, relations with the less developed countries and with the centrally planned societies."

Trilateralism Is Leading the Way Toward the First Truly Global Political System

The authors next make a momentous statement: "Creation of the Trilateral Commission reflects an awareness that the present moment is of very great importance for the future of mankind. The bipolar leadership system of the cold war is diffusing into what may be the first truly global political system, with many actors playing significant parts at different levels." (*The Crisis of International Cooperation*, p. 53.)

The Foundation for a Global Political System Is Slowly Evolving

The construction of a "global political system" would mean that the nations of the earth would be required to adhere to decisions made by international institutions and bodies. The foundation for a global political system is slowly evolving today. The foundation is in place and the walls are now being constructed.

Moving from a System of Nation-State Governance to Global Governance

In conclusion Duchene, Mushakoji and Owen state: "If...the advanced industrial societies succeed in advancing from previous forms of nation-state cooperation to new forms of collective cooperation, they will have created a framework to deal with the essential problems of the next decades." (*The Crisis of International Cooperation*, p. 54.)

Members of the Trilateral Commission Are Aided by the Atlantic Council in Constructing a New Superstate

From the above quoted material we can see that the nearly 300-member Trilateral Commission is working hard to converge the economics of the western world and to construct a new global political and economic system. Along side the Trilateral Commission is another elitist and prestigious group based in Washington, D.C., the Atlantic Council. Many of its directors are also members of the Trilateral Commission. The Atlantic Council also believes in construction of a global political and economic system. They too have been working forcibly for greater international cooperation among the Trilateral nations and Russia.

A Special Report on Global Governance and Economic Summits

In April of 1977 they published a special report, entitled "Harmonizing Economic Policy: Summit Meetings and Collective Leadership," which dealt exclusively with international cooperation and economic summits. The rapporteur

of the report was C. Tyler Wood, though the report was the joint effort of the Council's Working Group on Economic Policy. Members of this prestigious group included Henry H. Fowler, Partner, Goldman Sachs and Co.; Miriam Camps, Senior Research Fellow, Council on Foreign Relations, Emilio G. Colado, former Executive President of Exxon Corporation; Richard N. Gardner, current U.S. Ambassador to Italy; William McChesney Martin, former chairman, Board of Governors, Federal Reserve Board; Charles W. Robinson, Senior Managing Director, Kuhn Loeb; Frank A. Southard, Jr., former Deputy Managing Director and U.S. Executive Director, International Monetary Fund; Philip H. Trezise, Senior Fellow, Brookings Institution; John W. Tuthill, former Director General, Atlantic Institute for International Affairs; and Marina V.N. Whitman, Professor of Economics, University of Pittsburg.

The London Summit Was an Opportunity to Inaugurate the Process of Harmonization of Economic Policies

It is important to note that this report was prepared in advance of President Carter's first economic summit in London. The report begins as follows: "The economic summit meeting in London on May 7 and 8 (1977)... of [the] key industrialized democracies...provides an opportunity to inaugurate an orderly and far reaching process of harmonizing their economic policies.... The nations represented at that meeting form the core of the international economic system." (*Harmonizing Economic Policy: Summit Meetings and Collective Leadership*, Atlantic Council of the United States, Boulder, Colorado: Westview Press, no date, p. 5.)

The Breakup of the Old Concert of Powers

The report also notes: "New more flexible arrangements are emerging experimentally to take the place of the old Bretton Woods international monetary system which centered on the dollar and its link to gold. The breaking up of the dollar-gold link symbolized the fact that other economic powers in Western Europe and Asia were now assuming a more vigorous role in the shaping of the world economy and the economic weight of the United States in the postwar years was being redressed." (*Harmonizing Economic Policy*, pp. 5-6.)

A Change in Leadership of the Concert of Powers

In other words there was a shifting of power in the world which required a shift in the old concert of powers which existed under Bretton Woods. The U.S. was the leader in this concert. Prior to Bretton Woods it was a European-based concert of powers. Power or governance of the renovated international economic system is now to be shared by the U.S., Western Europe and Japan.

The Need to Adapt Existing International Institutions for Global Governance

The report continues: "The launching of a vigorous effort to harmonize the economic policies of the industrial nations would not of itself entail the creation of new international organizations. What it does require is the adaptation of existing machinery, especially that of the OECD...." (*Harmonizing Economic Policy*, p. 7.)

Collective Leadership Is Unprecedented in Time of Peace

The working group on economic policy noted that: "Collective leadership [of leaders and nations] is historically unprecedented in time of peace. The task of bringing it into being will undoubtedly present many difficulties. It will require working patiently through many instrumentalities." (*Harmonizing Economic Policy*, p. 8.)

Common Management at the International Level

The development of joint policies and programs and leaders of nations is most common in time of war when alliances are made. Wars have a tendency to solidify or centralize decision-making or governance into one head, body or group.

The Traditional Reluctance of Nation-States to Give Up Their National Sovereignty

The difficulty which the report foresees, at least in the U.S., is among the numerous agencies of government who have economic responsibilities and among Congress. It is not easy to persuade congressional or legislative leaders to give up their economic and eventually political sovereignty to an international body or group of decision-makers.

Economic Summits Are Indispensable Elements in Global Management

The report feels that "economic meetings at the summit, exemplified by the recent experimental meetings of the Heads of Government of certain key nations at Rambouillet and Puerto Rico, are indispensable elements in the process of creating 'collective leadership.'" (*Harmonizing Economic Policy*, p. 8.)

Specific Policy Recommendations

The Atlantic Council's Working Group on Economic Policy made a number of specific recommendations on ways in which the industrialized nations were to seek to harmonize or converge their economic policies. This section of the report stated the following:

"We make the following recommendations:

"1. The industrial democracies, led collectively by those whose economies have a major impact on the international economic system, should now seek to harmonize those of their economic policies which have a significant effect on world economic well-being. Specifically:

"They should seek, through systematic consultations and collective economic analyses and appraisals, to make compatible with one another their individual economic goals and targets with respect to employment, growth, price behavior, interest-rate and other monetary conditions, and the balance of international payments.

"They should work together in helping to achieve a smoother functioning of the international monetary system and the provision of private, public and intergovernmental credit essential to the operation of the system.

"They should coordinate their support for increasing the flow of resources for the developing countries, improving the use of development resources, and promoting the transfer of suitable technologies.

"They should develop common policies with respect to proposals for reducing wide fluctuations in prices and flows of primary commodities and for the establishment of adequate grain and other food reserves needed by developing and developed countries alike.

"They should intensify their efforts to liberalize their own trade, coordinate their agricultural policies and programs affecting trade, improve the international trade rules to which they will adhere and strengthen institutional arrangements to settle trade disputes and prevent the resurgence of protectionism.

"They should seek greater congruence in their industrial and environmental policies likely to affect the conditions of international competition.

"They should institute comparable and compatible programs and policies for the conservation of energy and development of new energy resources, and should adopt common rules governing the export of nuclear power equipment and technology in furtherance of the objectives of promoting peaceful uses of nuclear energy while preventing the proliferation of weapons capabilities.

"They should, as market-economy nations, concert their policies in dealing with the growing involvement in the world economic system of the command economies of Eastern Europe and Asia.

"They should seek to harmonize their policies with respect to the responsibilities of host and capital exporting countries concerning direct foreign investments in order to maximize their potential contribution to world economic growth.

"They should, in harmonizing these and other economic policies having significant international effects, act in ways that will encourage and expedite the development and growth of the developing countries' economies.

"2. To bring about harmonization of this far-reaching character requires the personal involvement of the Heads of Government themselves. The forthcoming summit meeting should therefore agree to institute a process of regular consultation by Heads of Government, with adequate provision for continuity, for orderly preparation, and for monitoring the implementation of decision.

"Participants in such meetings should regularly be the Heads of Government of the key industrialized democracies, with other Heads of Government, or others, invited to participate as appropriate. For example, the President of the Commission of the European Community will participate in the May meeting.

"The participants should, as occasion warrants, invite the attendance of the heads of international economic agencies, particularly the OECD, the IMF or the IBRD.

"3. In order to prepare for these meetings, each Head of Government should designate an official responsible to him who could facilitate the internal coordination of policy within this Government and also meet and maintain contact with similarly designated officials from the other participating governments. These designees would arrange for the agenda of subjects to be discussed, identify issues or problems on which harmonization of policy is inadequate, serve as an "early warning system" with respect to potentially critical situations and, if necessary, recommend *ad hoc* Ministerial meetings. This group of key government advisers should seek the assistance and cooperation of the Secretary General of the OECD.

"4. The industrialized democratic nations should, in their efforts to harmonize their economic policies, act whenever possible within the framework of existing international institutions, or adaptations of such institutions, in ways that will improve their functioning, strengthen their staff support and leadership, and further their overall objectives. To these ends:

"Existing international economic organizations, notably the OECD and the IMF, should be used to play a more effective role in:

(a) facilitating harmonization of policies at the senior expert or Ministerial level;

(b) developing collective judgments as to the combined effect on the international system of the separate goals and domestic and international policies of the key nations; and

(c) maintaining continuous review of the effectiveness and compatibility of actions taken in line with agreed policies.

"The committee structure of the OECD should be streamlined and made more flexible.

"The new Council of Ministers provided for by the amendments to the IMF Agreement should be brought into being.

"The trade rules and institutional arrangements of GATT should be reformed.

"5. Within the existing institutional framework greater use should also be made of small, informal meetings of policy-making officials of the key governments, such as the increasingly frequent meetings of Finance Ministers, central bankers and other responsible officials, provided that they are effectively geared into the process as a whole.

"6. Through all channels there should be wider and more expeditious international sharing of information on prospective national economic policies. Each nation should also develop greater disposition, now often lacking, to engage in the genuine solicitation of the views of others as a prior input to national policy-making, in place of the mere notification of policies already decided upon nationally.

"7. The process of harmonization of economic policy, including the development of collective leadership at the top, should be regarded as a flexible, evolutionary one, open to change in the light of experience." (Harmonizing Economic Policy, pp. 10-12.)

A Tremendous Step toward Global Governance

Implementation of the Atlantic Council's recommendations would constitute a tremendous step toward global governance and decision-making at the international level. In order for the above recommendations to occur, each nation would have to begin transferring its economic and political sovereignty to such bodies as the OECD, IMF, World Bank, Summit Preparatory Committee, etc. This process is currently underway.

The Battle Between the Forces of Nationalism and Internationalism

In order to implement these far-reaching goals, the forces of internationalism and interdependence will have to marshal its troops to battle the forces of nationalism.

More Comprehensive and Coordinated Economic Planning Is Ahead

Charles W. Yost summarized the difficulties ahead for the forces of interdependence when he forecast the following: "What will be required of leaders everywhere will be much more bold, comprehensive and coordinated economic planning, national and international, than they have dared apply in the past." (*Christian Science Monitor*, November 19, 1976.)

The Carter Administration Launched Trilateralism with Fervor

The fervor which the Carter Administration felt for international cooperation and global governance was demonstrated in January of 1976. Richard L. Strout noted that the "Carter Administration, acting even before Jimmy Carter [took] the presidential oath, [had] sent Richard E. Cooper, Yale economist and designated Under Secretary of State for Economic Affairs, to Tokyo to coordinate policies." (*Christian Science Monitor*, January 18, 1977.)

A Well-Prepared Administration

As noted earlier, perhaps no administration in the last century, with the exception of President Roosevelt, has been so well prepared with a concrete set of goals and foreign policy objectives as the Carter trilateral team.

The Trilateral Attitude Toward International Cooperation

A confidential draft declaration of the Downing Street Summit in London summarized the trilateral attitude toward international cooperation as follows:

"With every year that passes, it becomes clearer that the world economy has to be seen and managed as a whole, an enterprise which will involve cooperation not only between national governments but in the appropriate international organizations...; what we have tried to do is to ensure that our national decisions are coordinated and to ease the way to international action in all the bodies where decisions are required." (Manuscript Copy, p. 1.)

A Call for a Special Representative to Handle Economic Summits

The Atlantic Council report stated that "each Head of Government should designate an official responsible to him who could facilitate the internal coordination of policy...." In 1977, President Carter designated Henry D. Owen as Special Representative of the President for Economic Summits and U.S. Ambassador at Large. Other recommendations of the Atlantic Council's working group were also been implemented by the Carter Administration. At the 1977 London Summit it was decided to establish a "Preparatory Group" made up of carefully selected individuals from the U.S., Western Europe and Japan who would "arrange for the agenda of subjects to be discussed, identify issues or problems on

which harmonization of policy is inadequate serve as an 'early warning system' with respect to potentially critical situations and, if necessary, recommend ad hoc Ministerial meetings." That group has been referred to as the "Owen Preparatory Group."

A List of Members of the Tokyo Economic Summit Preparatory Group

The list of participants of the Owen Preparatory Group for the Tokyo Summit included:

Canada

Mr. Robert Johnstone, Deputy Under-Secretary, Department of External Affairs; Mr. Robert K. Joyce, Assistant Deputy Minister, Department of Finance; Mr. Jacques S. Roy, Assistant Secretary to the Cabinet, Privy Council Office;

France

Mr. Bernard Clappier, Governor of the Banque de France; Mr. Henri Froment-Meurice, Director General for the Economic and Financial Affairs, Ministry of Foreign Affairs; Mr. Jean-Yves Haberer, Director General of the Treasury, Ministry of Economy;

Germany

Dr. Horst Schulmann, Head of Department for Economic, Fiscal and Social Policy of the Office of the Federal Chancellor; Dr. Hans-Werner Lautenscholager, Head of Department for External Economic Policy, Foreign Office; Dr. Waldeman Mueller-Thuns, Deputy Head of Department for External Economic Policy and Development Assistance of the Federal Ministry of Economics

Italy

Mr. Umberto La Rocca, Permanent Representative of Italy to the United Nations; Mr. Renato Ruggiero, Minister Plenipotentiary, Economic Affairs Bureau, Ministry of Foreign Affairs; Dr. Silvano Palumbo, Counsellor to the Minister of the Treasury;

United Kingdom

Sir John Hunt, Secretary of the Cabinet; Sir Michael Palliser, Permanent Under-Secretary of State and Head of the Diplomatic Service; Mr. K. E. Couzens, Second Permanent Secretary of the Treasury;

United States

Mr. Henry Owen, Special Representative of the President for Economic Summits; Mr. Richard N. Cooper, Under-Secretary for Economic Affairs, Department of State; Mr. Robert D. Hormats, Deputy Assistant Secretary for Economic and Business Affairs, Department of State;

EC Commission

Mr. Crispin Tickell, Chief of Cabinet of the President of the Commission of the European Communities;

Japan

Mr. Hiromichi Miyasaki, Deputy Minister for Foreign Affairs; Mr. Takehiro Sagami, Vice Minister of Finance for International Affairs; *Mr. Isamu Miyazaki, Director General of the Coordination Bureau, Economic Planning Agency; *Mr. Shiro Miyamoto, Director General of the International Trade Policy Bureau, Ministry of International Trade and Industry. (Official document, Office of Henry Owen, Old Executive Office Bldg., Washington, D.C., no date. Reprinted by permission.) *to attend alternately

Heads of State at the Tokyo Summit

The list of participants from the individual governments for the Tokyo Summit on June 28-29, 1979, includes the following:

Canada

Joe Clark, P.C., M.P., Prime Minister; Flora MacDonald, P.C., M.P., Secretary of State for External Affairs; John Crosbie, P.C., M.P., Minister of Finance;

France

Valery Giscard d'Estaing, President; Jean Francois-Poncet, Minister of Foreign Affairs; Rene Monory, Minister of Economy; Andre Giraud, Minister of Industry;

Germany

Helmut Schmidt, Federal Chancellor; Hans-Dietrich Genscher, Vice Chancellor and Federal Minister for Foreign Affairs; Hans Matthoefer, Minister of Finance; Dr. Otto Graf Lambsdorff, Federal Minister of Economics;

Italy

Guilio Andreotti, President of the Council of Ministers; Arnaldo Forlani, Minister of Foreign Affairs; Filippo M. Pandolifi, Minister of the Treasury;

Japan

Masayoshi Ohira, Prime Minister; Sunao Sonoda, Minister for Foreign Affairs; Ippei Kaneko, Minister of Finance; Masumi Esaki, Minister of International Trade and Industry;

United Kingdom

Margaret Thatcher, M.P., Prime Minister; Lord Carrington, Secretary of State for Foreign and Commonwealth Affairs; Sir Geoffrey Howe, M.P., Chancellor of the Exchequer;

United States

Jimm Carter, President; Cyrus Vance, Secretary of State; W. Michael Blumenthal, Secretary of the Treasury; James R. Schlesinger, Secretary of Energy;

Commission of the European Community

Roy Jenkins (*Ibid.*)

Private Policies and Programs

Joint decisions, policies and programs were worked out privately before the economic summits by the Owen Preparatory Committee. The leaders of the industrial nations were then called together at the summits, such as in Tokyo, to announce the joint decisions and programs which they desire to have implemented by each nation.

An Interview with Jim Cochran

Jim Cochran, a member of the National Security Council Staff assigned to Henry D. Owen's office, stated in an interview, which follows, that when a summit meeting is held there are really two summits being conducted simultaneously. One meeting is between the official heads of state, such as President Carter, etc. The other meeting is between the Finance Ministers, Special Representatives for Economic Summits, Treasury and State Officials, etc. This latter meeting, Mr. Cochran stated, is the real summit meeting. The other meeting is held for the press to stimulate public acceptance of the joint decisions and programs worked out previously and finalized at the summit by the Preparatory Group. The interview is as followed:

Mr. Chadwick: How many people work on the economic summits?

Mr. Cochran: Since the summit is a once-a-year event, the staff, both in this building, the State Department, and in other places such as the Department of Energy, for this year's summit, has a tendency to be seasonal. As the summit approaches, more and more people find themselves in summit-related work.

Ambassador Owen is confirmed by the Senate and is responsible for economic summitry. He sits in this building. He serves as the President's personal representative for the summit process. Within this area the staff structure is rather informal. We have in this office a cluster of three or four people who work on economics. We are considered an economics cluster within the National Security Council. We assist Henry Owen with the process of summit planning and follow up. It is very difficult.

It is a difficult system to describe. It is a good system because sources are made available when they are needed. There is no large prominent, intra-structure that exists year in and year out.

Selection of Topics at Economic Summits

Mr. Chadwick: Who selects the topics that are discussed at the summit meetings?

Mr. Cochran: Selection of topics is a multilateral process. The discussion of summit agenda emerges with discussions. There is a preparatory process within each government, the United States government, the government of Japan, the French government, as well as among other governments. There are many preparatory meetings on a multinational basis which precede the summit. There are also follow-up meetings. The follow-up meetings are not open to the public.

The Summit Process

Think of the summit process working in the following way. At the economic summit the head of government is flanked by his finance minister and foreign minister. In the case of the United States, President Carter, in Tokyo, was flanked by his Secretary of State, Cyrus Vance, and his Secretary of the Treasury, Secretary Blumenthal. This process is repeated with other governments. The actual economic summit is a meeting of the heads of government and foreign ministers.

At the same time there was a parallel meeting of Henry Owen and his counterparts who represented the heads of government. This meeting included experts in international economics, such as the foreign ministry's finance ministers, etc. In the case of the United States the Treasury Department was represented by Under Secretary Anthony Solomon. Richard Cooper, Under Secretary of State for Economic Affairs represented the State Department. So you have two meetings at the economic summit occurring simultaneously. This trio from each country is the on-going, planning core for the summit process.

The Economic Summit Team

Mr. Chadwick: At one meeting you have the President, Secretary of State and Secretary of Treasury. In the other meeting you have Ambassador Owen, the

President's personal representative for economic summitry and Anthony M. Solomon, Under Secretary of the Treasury for Monetary Affairs and Richard N. Cooper, Under Secretary of State for Economic Affairs.

Mr. Cochran: We have a parallel effort. There is a continuous process of feedback between the two groups on a session-to-session basis.

Mr. Chadwick: Are they discussing the same agenda?

Mr. Cochran: Typically, yes. They are moving in a parallel fashion, although they don't necessarily have to be in a perfect harmony. For example, the heads of government could be discussing one agenda item and the finance ministers could be discussing another one.

Quite often the deputies will have met several times before the economic summit and will be there really to thrash out issues. Each country has one person designated as the person responsible for economic summitry.

Economic Summitry with Regards to Constitutional Questions

The joint exercise of economic and political sovereignty with other nations by the executive branch of the U.S. government raises a number of constitutional questions. Article I, Section 1, of the U.S. Constitution states: "All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives." Article I, Section 8, Clause 3 of the U. S. Constitution states that Congress shall have power to "regulate commerce with foreign Nations, and among the several states..." Congress is given exclusive authority in these areas, however, the process of economic summitry appears to bypass these restrictive clauses. Article II, Section 3, gives the President power "to give to the Congress information of the State of Union, and recommend to their considerations such measures as he shall judge necessary and expedient" and requires him to "take care that the laws be faithfully executed."

At the economic summits the American people are committed to numerous joint programs and policies in which U.S. representative stake no direct part. Agreements entered into at the summits resemble a treaty. It would appear that the process of economic summitry is also a violation of Article II, Section 2, Clause 2, of the U.S. Constitution. This clause states that the President "shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur...."

The Senate is given concurrent jurisdiction with the president in the treaty process. However, International Agreements made by the President and his close advisors at the economic summits have not been submitted to the Senate for their approval.

The Evolutionary Movement of Individual Nations into Global Governance

At each of the successive economic summits beginning in Puerto Rico in 1975 and continuing today, there has been a consistent effort to intensify efforts to converge the economies of the West. Each of the summit declarations demonstrate the evolutionary movement of individual nations into a global system of governance. With each summit greater measures are being taken to harmonize economic policies. With each summit, international institutions are being strengthened to facilitate the new demand of "decision-making in an interdependent world." With each summit more and more decisions which affect domestic policy are being made at the international level. The end of the nation-state and national sovereignty is being heralded by influential members of the Trilateral Commission the Council on Foreign Relations, the Atlantic Council, Brookings Institution, etc.

Decision-Making in an Interdependent World

In the summer of 1975 the Atlantic Council stated:

"The traditional pattern of diplomacy conducted bilaterally between sovereigns by Ambassadors and Foreign Offices is as obsolescent as the sailing vessel. In the 20th Century it is being progressively replaced by multilateral efforts to harmonize policy and action on major matters of common human or national concern.

The Sovereign Nation-State Has Lost the Ability to Achieve Its National Goals

"The government of a sovereign nation-state has the authority to legislate within its own frontiers but it has lost the ability to achieve its national goals and the aspirations of its peoples solely by its own isolated efforts.

Adapting the Nation-State to the Twentieth Century

"It is hardly a coincidence that the nation-state replaced feudalism shortly after the introduction of gunpowder into the West. The world is currently groping for means of adapting the nation-state to the requirements of the nuclear and space age on a crowded, urbanized and industrialized planet, shrunken in size by communication and transportation, *and* in ferment from the scientific, technological and information explosions of recent years.

Goals Can Only Be Achieved by Common Management at the Global Level

"Yet most of us were taught in our early formative years that the nation-state was the highest form of political organization. 'National sovereignty' is a powerful political slogan and it takes time for governments and peoples to realize that its goals can be achieved only by its exercise jointly with that of other nations.

The Development of Effective Means for the Joint Exercise of Sovereignty by Key Nations

"The development of effective means for the joint exercise of sovereignty by key nations with respect to common problems is a basic need of today's and tomorrow's world...." (Decision-Making in an Interdependent World," *The Atlantic Community Quarterly*, Summer 1975, Vol. 13, No. 2, p. 137. See also "Planned Diplomacy," an Atlantic Council publication.)

We Are Entering a New Era

We are indeed entering a new era – the era of global governance, of trilateralism, of decision-making at the international level; the era of the decline of the nation-state, of the decline of national sovereignty; the era of confrontation between the forces of nationalism and internationalism; the era of interdependence; the era of a new international economic and political system – a new trilateral superstate.

Part VI The Central Engines of Global Governance

12. Organization for Economic Cooperation and Development – Central Economic Planning at the Global Level

Part I – Introduction

In 1968 Richard W. Cooper, writing in *The Economics of Interdependence: Economic Policy in the Atlantic Community*, stated:

"During the past decade there has been a strong trend toward economic interdependence among the industrial countries. This growing interdependence makes the successful pursuit of national economic objectives much more difficult. Broadly speaking, increasing interdependence complicates the successful pursuit of national economic objectives in three ways. First, it increases the number and magnitude of the disturbances to which each country's balance of payments is subjected, and this in turn diverts policy attention and instruments of policy to the restoration of external balance. Second, it slows down the process by which national authorities, each acting on its own, are able to reach domestic objectives. Third, the response to greater integration can involve the community of nations in counteracting motions which leave all countries worse off than they need be. These difficulties are in turn complicated by the fact that the objective of greater economic integration involves international agreements which reduce the number of policy instruments available to national authorities for pursuit of their economic objectives. (New York, McGraw-Hall Book Co., 1968, p.148.)

Management of the International System

In order to manage the state of interdependence created by the international financial, economic and trade systems, the elite of the world have designed and built a number of international institutions. One such institution is the Organization for Economic Cooperation and Development, commonly referred to as the OECD. It is located in Paris. The OECD is to serve as the institutional mechanism for joint supervision and management of the economies of the advanced countries of the world. In other words, the OECD is to ensure the continued integration of the Western world through the formation of joint economic objectives and policies.

Central Economic Planning on a Global Basis

While we have witnessed the process of centralized economic planning and control at the nation-state level, never before have we had central economic planning on a global basis. A recent pamphlet outlines eight aspects of the OECD's work:

"a high-level forum where government officials consult on the key economic policy issues.

"detailed economic analysis and short-term forecasts for economic policy-makers.

"reviews of the economic performance and policies of each Member country.

"high-level cooperation on the main issues of balance of payments and international monetary policy.

"organization of financial aid to Member countries encountering exceptionally serious economic difficulties.

"analysis and consultations on policies for achieving adequate price stability and full employment in the face of increased difficulties, notably in the energy field.

"investigations of policies conducive to sustainable medium-term economic growth and of longer run structural and resource allocation problems.

"publication of internationally standardized economic statistics. (Official document, "OECD at a Glance", OECD, 2 rue Andre Pascal, 75775 Paris Codex 16, no date, p. 3.)

Part II – Membership in the OECD

Membership in the OECD includes the following nations:

Membership

Australia	Luxembourg
Austria`	Netherlands
Belgium	New Zealand
Canada	Norway
Denmark	Portugal
Finland	Spain
France	Sweden
Germany	Switzerland

Greece	Turkey
Iceland	United Kingdom
Ireland	United States
Italy	Japan

Part III – Goals of the OECD

The OECD is one of the largest and most important international institutions in the world. Its goals include:

Development

"encouraging a coherent approach to development problems in the OECD as part of the overall national policy of every Member country

"promoting a positive approach to the dialogue between developed and developing countries

"increasing the volume and effectiveness of aid to developing countries

"promoting imports of goods from the developing countries

Trade

"maintaining and improving the open and multilateral trading system by preventing protectionism and further liberalizing international trade

"monitoring and improving the functioning of national and international capital markets

"helping to increase international investment flows

"working for equitable treatment for enterprises under foreign control

"promoting compliance of multinational corporations with agreed guidelines of behavior

"facilitating cooperation between national tax administrations

("OECD at a Glance," pp. 508.)

Part IV – Decision-Making at the OECD

The OECD is designed for global management of national policies and decisions. Control over the development, implementation, operation and supervision of national economic policy is being taken from the free markets in democratic countries and from central governments in socialistic countries and turned over to an international rule-making or decision-making institution. In 1968, Ambassador Roger Ockrent participated in a conference on "Decision-Making in International Institutions," sponsored by the Graduate School of Business at the University of Chicago. His paper was entitled, "Decision-Making in the OECD," Chapter I of Ambassador Ockrent's paper is entitled, "The OECD as a Management System."

The Influence and Power of the OECD

In this section, Ockrent outlines the influence and power which the OECD has gained over the member nations which adhere to OECD policies. He stated:

"It is important to start by placing the O.E.C.D. in its historical perspective, before going on to specify the fields in which it is active – in other words to define the management systems to which it belongs – and to determine the aims of its action in these different fields.

Section 1 – History

"It is common knowledge the O.E.C.D. is the successor of the O.E.E.C. (Organization for European Economic Co-operation), an institution created in 1948 between 17 European countries (1) on the initiative of the United States, in order to give the greatest effect to American aid to European reconstruction (the Marshall Plan) by means of recovery programmes formulated by common agreement between Member countries and implemented by a judicious distribution of aid.

Restoration of the International Economic Order

"From 1948 to 1958 the main activity of the O.E.E.C. was the restoration in Europe of an international economic order founded on the laws of the market. Formal decisions necessarily played an important part in this action, directed as it was towards modifications in the legal structure of international trade and payments, (liberalization of trade by the elimination of quantitative restrictions; the operation of the European Payments Union).

"(1) Austria, Belgium, Denmark, France, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Sweden, Switzerland, Turkey, United Kingdom, Occupation zones of Germany – Spain joined the O.E.E.C. in 1959.

The Management System of the World Economy

"From 1958 onwards the combination of a number of circumstances raised the problem of the future of the O.E.E.C.:

- the restoration of convertibility had the effect of bringing the European countries back into the 'management system' of the world economy and under the jurisdiction of the world-wide institutions especially in the field of trade (G.A.T.T.) and currency (I.M.F.);

- the political trend in Europe was reflected in the determination to pursue the integration of national economies on a more limited geographic plane (E.E.E.-E.F.T.A.);

- the economic recovery of Europe raised in new terms the question of economic co-operation between the United States and Europe.

The Development of the OECD

"The O.E.C.D. (Organization for Economic Co-operation and Development) arose out of these new circumstances. It has a membership today of 21 [24 today] countries. Its Constituent Convention, which came into force in 1961, assigns it the following aims:

- to achieve economic growth in Member countries while maintaining financial stability;

- to contribute to the expansion of world trade on a multilateral non-discriminatory basis;

- to contribute to the economic expansion of countries in the process of economic development.

"The pursuit of these aims, unlike those of the O.E.E.C., does not on the face of it involve direct action to influence the international legal framework of trade and finance although such action is in no way ruled out and does in fact exist in certain limited sectors.

"(1) The 18 O.E.E.C. Member countries, Canada and the United States and since 1964, Japan.

"In practice, and with the inclusion of certain developing countries with traditional ties with Europe, the Organization has become a forum for economic consultation among the industrialized countries with a market economy.

Section 2 – The Fields of Competence of the OECD

"If we adopt the concept of a management system, as defined in the context of this Conference, we must admit that it is by no means easy to identify the fields of competence of the O.E.C.D. with a given 'management system' or even with a number of systems. In practice, the limits of its competence are wide and imprecise both geographically and functionally.

The OECD Is a Global Organization

"Geographically. Although its Member countries are few in number, the O.E.C.D. cannot be regarded as a regional organization;

" – its Member countries do not belong to a self-contained region;

" – a number of non-Member countries take part in certain activities (Finland, Australia, New Zealand, Yugoslavia, Israel);

" – the contribution of Member countries to the economic development of Non-Member countries is one of its main concerns;

" – its economic weight is preponderant in the world economy.

Its geographical composition seems rather to be defined by a community of interests and traditions affecting the problems and methods of administering the economy.

"In certain cases where this community of interest is not shared by all Member countries, the procedures of the Organization recognize this state of affairs by confining deliberations to the countries concerned.

"Examples: – The Development Assistance Committee consists of aid-giving countries only.

– The European Monetary Agreement is limited to European countries.

Specialization at the OECD

"Functionally. As indicated by its very name the paramount field of competence of the O.E.C.D. is economic; economic facts and economic policies. It in no way follows that its competence is clearly and rigidly circumscribed; furthermore, as we shall see its general economic competence is geared down by means of specialization.

The Power of the O.E.C.D. to Influence Nation-State Policy

"It is common knowledge that the economic sphere has no precise unalterable frontiers. The more perfect scientific understanding of economic questions and the growing intervention of the authorities have greatly widened our knowledge and increased our power to influence the phenomena which determine the standard of living in a given society.

"Example:

– Science and education are fields whose economic incidences are much better recognized today than they were ten years ago.

The Management Systems at the O.E.C.D.

"It will no doubt be conceded that management systems are infinitely divisible. This is certainly the case with the economy and consequently with the competences of the O.E.C.D. Descending the pyramid of competence, we find a first division between activities relating to the general economy or general economic policy and those which make a sectoral breakdown of the economy (agriculture, industry, finance, development assistance, etc.). General economic policy, in its turn, can be subdivided into cyclical policy and medium or long-term structural programming. Similarly, for example, development assistance policy includes a policy of financial aid and a policy of technical assistance and so on. It is, moreover, hardly necessary for the purposes of our analysis to make an inventory of all the sectors of competence of the Organization.

The Role of the OECD as a Legislator

"At this stage, two comments should be made:

"(a) at each level of specialization, the activity of the Organization is integrated in a set of national and international rules, customs and policies and makes its contribution thereto. There is therefore a more or less specialized management system at each level. The role played by the Organization is in no way uniform in all sectors. Important in some, negligible in others, this role may be that of a legislator in certain fields, a simple meeting place in others and a pressure group in others again;

"(b) this pyramid of competences of the Organization is matched, as we shall see later, by a pyramid of bodies (committees, expert groups, working parties, etc.). This hierarchical structure makes it possible to reconcile:

– the need for the services of highly specialized officials in certain particular disciplines;

- and the preservation of the unity of decision at policy level (i.e. the Council),.

Section 3 – The Aims of OECD Action

"Regardless of the fields of competence within which the Organization acts and regardless of its legal forms, such action may have two aims:

- to regulate certain international or even national transactions where such international regulation is in the common interest;
- to influence national authorities in the conduct of their policies.

A Considerable Extension of the OECD's Ability to Influence National Governments

"The transition from the O.E.E.C. to the O.E.C.D. has been reflected in a certain lessening of the regulative activity of the Organization and a considerable extension in its role of 'influencing' national governments. This trend should be set in the context of the growing inter-penetration of national economies and the complexity of the problems which arise in connection with the administration of the economy.

"(a) The O.E.C.D. participates in international law-and-policy-making ('regulating activity')

A Trustee of the Charter Governing International Transactions Between Countries

"The O.E.C.D. retains an activity of the regulative type in three different spheres.

"1. In certain limited sectors the Organization is the trustee of the Charter governing international transactions between Member countries

Example: – Codes of Liberalization: International transactions in services and capital movements are subject to certain rules designed to avoid the return to general exchange control;

– European Monetary Agreement: There are various provisions governing the reciprocal exchange guarantee and the variations from parity of authorized exchange rates.

"2. The Organization encourages international standardization in cases where greater uniformity may facilitate trade or industrial development or ensure the respect for certain rules of equity:

"Examples: – varietal certification of seeds, agricultural tractor tests;

– buffer stocks of petroleum products.

"3. The Organization exercises certain operational activities:

"(b) The O.E.C.D. influences the formulation of national policies and decisions

The Essential Role of the OECD

"It is becoming increasingly apparent that the essential role of the O.E.C.D. is, through information, consultation and concerted action, to bring home to national governments the international dimensions of their policies and decisions.

A Wide Range of Instruments of Influence

"Underlying this general formulation there is a very wide spectrum of instruments of influence ranging from the simple exchange of information to formal negotiation.

"Examples: – discussions on regional development policies take the form of an exchange of information enabling governments to profit in solving their own problems from the experience of their neighbors;

– discussions of anti-cyclical policy are designed to influence the decisions of each country along the lines deemed most conformable to the interests of the Community as a whole. The same is true of general development assistance policies;

The Authority and Influence of the OECD

"The Common characteristic of all these instruments of influence, which distinguishes them from the regulative processes, is that O.E.C.D. action depends for its ultimate translation into economic fact on the interposition of specific behavior on the part of national governments (formulation of policy, introduction of measures, abstention from certain measures, etc.). The extent to which O.E.C.D. action is decisive in determining such behavior obviously varies and this is one of the factors affecting the authority and influence of the Organization's work.

Assisting Other International Organizations

"The behavior which the O.E.C.D. seeks to influence may be individual or collective, as for example in preparing the work of other international organizations. The community of interests among Member countries of the O.E.C.D. normally induces them to use the Organization as a forum for consultation or the prior co-ordination of the attitudes to be taken or positions to be defended in international economic institutions with a wider geographic composition.

Examples: – The preparation by the Trade Committee of the proposals submitted to UNCTAD by the industrialized countries in the matter of special tariff treatment for developing countries.

– Although it has not been thought appropriate to use the O.E.C.D. as an instrument for prior consultation between the industrialized countries on questions relating to GATT and the IMF, this attitude is not necessarily irreversible.

The Role of Influencing National Governments

"It should be emphasized that there is no necessary relation between the legal form of O.E.C.D. action and the question whether such action is taken under the regulative role of the Organization or its role of influencing national governments. While the regulative competence of the Organization is normally exercised through acts endowed with a certain legal force (Decisions, Recommendations, etc.), it in no way follows that these forms are not equally appropriate to action by the Organization in its role of influence.

"Example: – Decision of the Council in December 1961 setting the growth target for 1960 to 1970 of an increase of 50 per cent in the real gross national product for all the Member countries combined.

National Sovereignties Are Being Automatically Eroded

"The preponderance of the Organization's role as a government adviser rather than an international legislature is essentially explained by the fact that its field of activity places it at the confluence of national and international responsibilities. Economic interpenetration, which is mainly felt in highly industrialized economies with frontiers open to trade and with convertible currencies, has the effect of conferring an international dimension on all national economic policies even when they relate to questions which are in principle purely internal. By the nature of things, national sovereignties are being automatically eroded since the effects of economic decisions, both internal and external, are no longer halted by the geographic frontiers of national sovereignty.

The Role of the OECD

"The role of the O.E.C.D. is not to rob national governments of their proper responsibilities, but rather to make them aware of the international implications of their action or inaction in the economic sphere in general and in each economic sector in particular.

"This ineluctable erosion of national sovereignties is moreover accompanied by nationalistic political reactions, which must no doubt be regarded as delaying offshoots of the phenomenon. They tend in effect to check the movement but no doubt cannot halt it."

Ambassador Roger Ockrent, "Decision-Making in the O.E.C.D." Conference on Decision-Making in International Institutions, June 8-9, 1968. University of Chicago Graduate School of Business, May 17, 1968, Paris, Manuscript copy, pp. 2-10)

Part V – OECD Policy Decisions

Chapter III of Ockrent's article is entitled, "The Forms in Which the O.E.C.D. Brings Its Influence to Bear." In this section the Ambassador details the means whereby OECD policy decisions are adhered to by member nations:

Section 1 – The Acts of the OECD

"Within the limits of this study it is hardly possible to make a thorough legal analysis of the different types of Act of the Organization. It must be enough to indicate briefly the various forms of Acts which result from the work of the Organization and the functions of each of them.

"(1) Decision

"Rule 19 of the Rules of Procedure distinguishes four categories of Decision, according to their effect:

"(i) Decisions binding on the members, which the latter shall implement after they have complied with the requirements of their appropriate constitutional procedures.

(ii) Decisions approving agreements with its members, non-member States and international organizations.

(iii) Decisions on internal matters concerning the work of the Organization which shall be known as Resolutions.

(iv) Decisions providing for communications to non-member States or to Organizations.

The Formation of Rules Which Are Binding on Member Countries

"It is under the first of these categories that the Organization has power to lay down normative rules or to make operational arrangements which are binding on Member countries.

"Examples: – Council Decisions are introducing the Code for the Liberalization of Current Invisible Transactions and Code for the Liberalization of Capital Movements.

– Council Decision granting Turkey a credit out of the European Fund.

Defining Policies to be Followed by Nation-States

"Decisions in the first category are in no way limited to the fields in which the Organization has regulative competence. The Organization also occasionally acts by Decision to give a certain impetus to the action of national governments. While in legal form the Decision remains imperative, its content is normally limited to a definition of the broad outlines of the policies to be followed without specifying the concrete measures by which these policies should be implemented. In these circumstances, the choice of the Decision as the appropriate type of Act depends less on the binding character of the Act than on the desire to express the collective will in solemn form.

"Example: – Council Decision setting a growth target of 50 per cent of gross national product in real terms for the period 1960 to 1970.

"(2) Recommendations

Recommendations of the OECD

"Rule 19(b) of the Rules of Procedure specifies that "Recommendations of the Organization...shall be submitted to the Members for consideration in order that they may, if they consider it opportune, provide for their implementation."

"Although, by definition, Recommendations have no binding legal force, the established usage of the Organization is to adopt only Recommendations whose provisions are generally acceptable by all member States. It follows from this that the Recommendations of the Organization are not very numerous, but that their de facto authority is little less than that of Decisions. The use of a Recommendation in preference to a Decision is normally explained by the fact that the Recommendation makes it possible to address a more precise invitation to member States while expressly safeguarding the reserved field of national sovereignties.

"Examples: – Council Recommendation on Active Manpower Policy

– Recommendation of the Development Assistance Committee on the conditions and financial terms of aid. (This Committee, which consists of the 15 Member countries interested in the co-ordination of development assistance is authorized by special delegation to make its own Recommendations whose legal force is equivalent to Council Recommendations). (Ockrent, pp. 15-17.)

Part VI – Managing Economic Interdependence

Management of the economies of the advanced industrialized societies in today's world is indeed a tremendous undertaking. Nevertheless, if the global economic, financial and trading system devised by the elite is to maintain its present position in the world there must be regulatory and planning agencies on an

international basis. Monopolies cannot exist without the assistance of governmental regulatory agencies. The OECD is a global regulatory agency which is totally responsible to those who created it – the international bankers, investment bankers and corporate directors.

The De-Evaluation of the Nation-State into an Administrative Unit

The OECD is in the process of maintaining, protecting and enlarging the monopolistic and corporate socialistic plans of the elite in the areas of trade, finance and economic policy. It is designed to destroy free market economies and replace them with command systems. In other words, the nation-state is to be de-evaluated to an administrative unit. Central economic planning is to replace the free economy. The OECD will design the rules and responsive individuals at the nation-state level will implement them. National political and economic sovereignty is being slowly eroded and transferred to such global bodies as the OECD.

The Core Global Institutions of the New Imperial System

The power of the OECD, as well as the other international bodies, has been gradually increasing since their inception. The elite are well aware that forces are at work in the world – domestic and external – that complicate their efforts to manage the world as a single economic unit. Domestic interest groups, pleas from the Third and Fourth World countries, structural inadequacies in elite ideologies, etc., are threatening the entire management system devised by the power structure in the world. In order to cope with this wide array of national and international problems the elite have decided it is necessary to strengthen the central institutions of their global command system – the BIS, IMF, IBRD, OECD and WTO. These five global institutions form the core or center of the New Imperial System designed to rule the world.

Strengthening the Role of the OECD

One of the key academic designers of the "new Imperial System" is Miriam Camps, former Senior Research Fellow at the Council on Foreign Relations. In 1975, Camps produced a lengthy treatise outlining the steps which should be taken to strengthen the OECD. It was entitled, "First World Relationships: the Role of the OECD."

The report is the "definitive" study on the role which the elite would like the OECD to play. At the beginning of her article she sets the stage by pointing out the need for the OECD to manage economic interdependence. She stated:

"...There have been two main reasons, or two main groups of reasons, for a resurgence of interest in what has come to be called 'the advanced-country relationship'.

Interlinkage of the Economies of the Developed Countries

"The first in point of time although not in terms of public attention was the growing awareness of how interlinked the economies of the highly developed, market-economy countries were becoming, how vulnerable each was to developments in the others, and how central the relationship among this group of countries was to the health of the global economic system. The shift in economic power – the decline in the preponderance of the U.S. and the growth of new centers of economic power in Japan and Europe – began in the late 'fifties and early 'sixties, but many of the implications of the shift only became widely appreciated a decade later with the break-down in much of the Bretton Woods system (in large measure a consequence of the shift in power).

Vulnerability of Developed Countries

"The second main reason for the new attention being given to the advanced-country relationship in general and to the OECD in particular has come not from the recognition of the vulnerability of the members of the group to one another but from their vulnerability to the actions of third countries and, in particular, to the actions of the OPEC (the Organization of Petroleum Exporting Countries)....

Management of Economic Interdependence

"The actions of the oil-exporting countries in embargoing exports during the Yom Kippur war and in steeply pushing up prices, the consequential massive shift in real resources, and the continuing uncertainty about how the enormous credits being piled up by the oil producers would be used, by posing acute problems for most of the OECD countries have also, of course, strengthened the first set of reasons for renewed interest in the OECD – underlining the need for more consultation about, and probably more "management" of, the advanced countries own economic interdependence...." (Miriam Camps, *"First World" Relationships: the Role of the OECD*, Paris: The Atlantic Institute for International Affairs, & New York: Council on Foreign Relations, Inc. Originally Published as Atlantic Paper No. 25, December 1975)

Reshaping OECD as an Institutional Expression for the Trilateral Nations

Camps feels that: "If the countries of the European Community were set on a clearly agreed, well-charted course to an economic and monetary union a case could be made for 'trilateralism' and for reshaping the OECD as the institutional expression of a process of inter-bloc management between the three major centers of economic power – the U.S., the European Community and Japan." (Ibid.)

Part VII – Global Institutional Arrangements Among the Advanced Nations

Economic policies of the advanced industrialized nations are being coordinated by the OECD in order to ensure the evolution of a more efficient global economic system. In a section entitled 'Roles and Functions,' Camps argues that there are three main reasons for international institutional arrangements among the advanced countries:

"The reasons for various kinds of institutional arrangements among the advanced, industrialized, market-economy countries – or the tasks requiring collective action – can be grouped under three broad headings: (1) those that derive essentially from the high degree of interaction among the economies of these countries and the consequent inability of individual national governments to attain desired domestic objectives without close co-operation with other governments; (2) those that derive essentially from the desire of this group of countries to order its relationship or to co-ordinate its strategy *vis-a-vis* other groups of countries in order to increase bargaining power or to make more effective some aspect of the inter-group relationship; and (3) those that derive essentially from the need to give more coherence and greater effectiveness to the international system generally....

How Far-Reaching Should Monetary and Economic Policy Be?

"The questions for the future are not whether the advanced countries will need to improve their arrangements for consultation and co-operation on monetary and general economic policy but, rather, how far down into matters such as interest-rate policy and the appropriate magnitudes for budgetary deficits or surpluses, which traditionally have been regarded primarily as tools for managing the domestic economy, it will be necessary – and politically feasible – for the process of intergovernmental consultation to reach; what countries should be involved in the process; what operational content should be given to 'consultations', i.e. whether the process should be pushed beyond an exchange of views to more formal acts of co-ordination; and how whatever is done among some group of advanced countries should be related to action the European Community level, on the one hand, and to action on the broader global level, on the other.... (Ibid.)

Part VIII – The Role of the IMF

It is evident that the OECD is reaching further and further into the internal policies of the nation-state as it assumes more and more power. The term 'intergovernmental consultation,' simply means the joint determination of policy among elite government leaders. National and political sovereignty do not enter the discussion because the elite are bent on constructing a truly global economic system where the nation-state is a mere administrative unit of global institutions such as the OECD. The OECD is the main international institution formulating policy in the global economic system.

The IMF is to Become the Focal Point

Miriam Camps feels that the IMF will become the focal point for management of the international monetary or financial system. She stated that:

"A few years ago it would have seemed reasonable to predict that a reformed and strengthened IMF would be the focal point for the management of the international monetary system and that, within such a system, the countries of the European Community could be expected progressively to act as a unit. Had there been substantial progress toward economic and monetary union at the European level and a codification of new rules at the international level – rules which were expected, *inter alia*, to enable exchange rates to take more of the burden of adjustment under close IMF surveillance – and, of course, no dramatic development comparable to the steep increase in oil prices, the need of advanced-country action on monetary policy might have been a fairly limited one....

Close Cooperation Among Central Banks

"Although all the major currencies are now floating, none is doing so without a measure of intervention. And, contrary perhaps to the expectations of some of those who have advocated floating as a way to increase, or regain, autonomy, the need for fairly continuous consultation and a good bit of co-ordinated action among the key industrial countries in the management of floating rates has come to be widely recognized as necessary. Speaking to a meeting of the Atlantic Institute for International Affairs in November 1974, Robert Roosa envisaged the development of close-co-operation among central banks 'under the watchful eye of the International Monetary Fund'. As he put it: 'As the management of floating develops, each central bank will unavoidably be reflecting two judgments, which it must pair into one general view. First, it must have a view on the broad relationship of its own prices and availabilities for goods and services in trade, to those on average in other countries of importance for its own trade. Second, it must take a position of the likely, and appropriate, flows of capital (long and short) to be expected to move across its own exchanges. In working out acceptable zones for some intervention to help assure a degree of stability of the exchange rate between its currency and others, the central bank will form judgments as to whether the policies of the other countries are consistent with the approach to exchange rates that their central banks wish to take'.

Involvement of Each Leading Country in the Economic Affairs of the Other Nations

"And he went on to predict a 'must more frequent, intimate, and thorough interest (and even involvement) of each leading country in the economic affairs of the others'. Although Mr. Roosa was arguing – at this point – that the need to introduce some stability in exchange rate fluctuations would lead to this more intimate involvement of key countries in each other's domestic policies, he, like

others, also reached the same conclusion starting from the other end and observing the inability – in an open system with huge amounts of highly mobile capital – of a country being able to accomplish its domestic goals using traditional implements of monetary policy unless those countries with whom it was most 'interdependent' were pursuing compatible policies.

Governments Should Not Pursue Completely Independent Economic Policies

"Today, many of those who in the past advocated floating rates and many of those who in the past advocated fixed rates are finding common ground not only on the inevitability of floating – for the near-term future at any rate – given the gross divergence in rates of inflation, levels of unemployment, etc., among the key countries and the huge amounts of liquid capital, but also on the face that the floating will and must be 'managed' in some way. Floating has given governments more freedom to pursue incompatible domestic policies than they would have had in a fixed-rate system. But it has not 'solved' the adjustment problem. In a world of Eurodollars, petrodollars and multinational enterprises there are too many transmission belts for governments to be able to pursue completely independent policies or to be willing to take all the adjustment on the exchange rate.

Management of International Monetary Cooperation

"Without more co-ordination of policy, fears of importing inflation, unemployment, or both, lead to self-punishing restrictions on trade and capital movements. And as Mr. Roosa implied in his remarks, the way floating is 'managed' and how the necessary co-ordination of policy is achieved – where, by whom, according to what guidelines – seems likely to go far to set the pattern of international monetary co-operation for the next decade or so.

Piecemeal Reform of the International Monetary Fund

"However, although there is a growing consensus that more 'collective management' is needed, there is, as yet, no clear view on how or where this can best be done, or, indeed, on how far beyond technical management by Central Banks it is necessary or desirable to go. The signs point in several rather different directions. On the one hand, although the report of the Committee of Twenty which was charged with making proposals for the comprehensive reform of the IMF was shelved when the monetary system was overwhelmed with petrodollars and floating became almost universal, the idea of piecemeal reform of the IMF is still very much alive; and a new Committee of Twenty – the Interim Committee – has been established to provide for more frequent discussions among ministers and high officials from member governments between the annual meetings of the Governors.

"On the other hand, despite the formation of this new Committee of Twenty, the old Group of Ten (G-10) – which it was supposed to replace – has not, in fact,

disappeared but seems to have a new lease on life. Its members are all advanced, industrialized, OECD countries; in contrast, the new Committee of Twenty represents the full IMF membership on a constituency basis roughly the same way as do the Executive Directors. Increased IMF activity has been matched by increased OECD activity: the negotiation of the Financial Support Fund – to be established in Paris and linked to the OECD; the setting up of an *ad hoc* committee within the EPC to keep under continuing review the financial impact on member countries of the changed energy situation and to monitor the market's ability to handle petrodollars; the formation of a group of economists of international standing to examine the constraints on growth.

Secretive Meetings of the Finance Ministers

"Not only have both the IMF and the OECD been given new committees and renewed attention during the last year or two, but there has also been considerable recourse during this period to what is being dubbed the G-5, that is the informal and sometimes very secretive meetings of the Finance Ministers, sometimes accompanied by the heads of the Central Banks, of the 'Big Five' – the U.S., Japan, Germany, France and the United Kingdom.

Monthly Meetings of the European Central Bankers

"One must, of course, also add to the list of international meetings the monthly meetings of the European Central Bankers at the BIS (Bank for International Settlements) which are attended by a representative of the Federal Reserve Board; frequent meetings of the Monetary Committee of the European Community; and very close co-ordination among the members of the 'snake'. Finally, of course, there has been must direct consultation among key Central Banks and, one supposes, a good bit of agreed intervention in the foreign exchange markets.

Drastic Reorganization of Global Institutional Arrangements Needed in the Next Decade

"What one thinks should come out of the current flux – how much inter-governmental agreement should be sought about rules for floating, how much co-ordination of policy is desirable, which institutions should be used for what purposes – depends to some extent on the time-scale in which one is thinking. For reasons I have discussed at some length elsewhere, it seems to me to be clear that in the not too distant future (i.e. the next decade or so) global institutional arrangements will need drastic reorganization to enable them to bear the 'management' load that the emerging international economic system will soon require.

Individual Governments Unlikely to Transfer Sovereignty to Global Institutions

"But for the next few years – very likely for the next decade – it seems to me to be almost equally clear that governments are likely to be unwilling and unready to make the changes in assumptions about national policy and governmental structures that this would require. Some global institutions may well be somewhat improved – and the IMF seems more likely than most to be substantially strengthened – but the global institutions are not likely to be reformed radically enough to carry the entire management load.

Need for Additional Global Institutional Arrangement

"There will – almost certainly – be need for additional institutional arrangements to provide, inter alia, for the continuous consultation, surveillance, and co-ordination of monetary and other macro-economic policies the advanced countries must undertake because of their vulnerability to each other's policies of domestic economic management – their tendency to aggravate each other's problems by the way they handle inflation, recession, etc. – and their inability to deal separately with common problems, perhaps most conspicuously today large speculative capital movements. But it is important that advanced-country institutional arrangements in this field, as in others, be so designed that they help, not hinder, the necessary reform of global institutional arrangements: this is not always easy, but it should be a condition against which any special advanced-country arrangements are continuously tested.

Safeguarding IMF's Role as the Rule-making Body in the International Management of Exchange Rates

"For the next few years, in any case, the IMF, the OECD – and probably some limited group of advanced countries within that framework – the European Community, and the BIS all have important roles to play. For the present, none of the key countries is likely to be willing to bind itself to rules that are sufficiently precise and detailed so that actions designed to affect the exchange rates are taken more or less automatically. However, the primacy of the IMF as the rule-making body in the international management of exchange rates should be safeguarded. And as it becomes possible to give more standing and greater precision to the IMF guide-lines on floating, this should be done.

Intervention by Central Banks

"The Central Banks and the BIS will clearly continue to play key roles in determining how to handle short-term disruptive fluctuations, and Central Bank intervention in the foreign exchange market will obviously be the main instrument used in the 'management' of floating. But, as Robert Roosa pointed out in the speech already quoted, 'a route will have to be found for co-operation not only

between central banks across the exchanges, but also between Governments and policies that stand behind the central banks'.

Difficulties in Coordinating Economic Policies

"When one departs from generalities and seeks to describe in more specific terms what the advanced countries should now be consulting together about and, even more, when one tries to push further and to define where they should commit themselves to some procedures, guide-lines, or codes of behavior, one runs into large difficulties. Perhaps the biggest difficulty arises from the fact that there is no good way to decide in advance how far into the realm of policies normally regarded as being mainly questions of domestic economic management it is now necessary for the process of international consultation among the advanced countries to reach. There is argument rather than agreement among the experts about many aspects of the way internal and external policies interact. And, in normative terms, there is no 'concept' or widely agreed goal from which principles can be derived.

Political Feasibility of a Single International Currency

"As indicated above, this absence of a guiding 'concept' is not a trivial problem, but in terms of the OECD – or any other similar institution of advanced countries – it is likely to remain an insoluble one. The 'advanced nations' – regardless of how in terms of specific countries that group is defined – are not an economic union in embryo. Nor are they an 'optimum currency area' if that term is defined – as it must be – to mean not only the area for which it would be economically efficient but also politically feasible to have a single currency, with all the implications for central institutions and transfer of sovereignty that implies.

International Monetary System to Evolve Around Trilateral Areas

"Sooner or later some basic political choices will have to be made. In the advanced industrial countries all economic policy is becoming a continuum, and where one draws the line between areas of policy that will be determined (mainly) autonomously and areas of policy for which the decisions will be reached (mainly) collectively-and with what group of countries – are essentially political decisions. Even on the European level the key countries are not yet prepared to make a choice – either one way or the other.

"It may be that the combined effect of a U.S. reluctance to go very far toward genuine consultation on questions such as interest-rate policy and a renewed interest in action on the European level (the outcome of the British referendum and the French decision to rejoin the 'snake' may be pointers) will mean that the monetary system evolves for a time, at least, around three blocs with considerable co-ordination of policy within each of the three blocks, the main burden of adjustment between the groups being taken on the exchange rate.

"Or it may be that the combined effects of the oil crisis, inflation, and recession will be to underline the interdependence of the advanced nations as a group and to cast a new kind of doubt on the European monetary option, i.e., adding to the existing doubts about the willingness of member governments to transfer powers to the European level uncertainty about whether that is the right place to try to draw a monetary perimeter.

Gradual Evolution of Discussions and Consultation to the Global Level

"For the present no one is ready to make final decisions; a period of groping for new relationships clearly lies ahead. It may be that after a time some of the kinds of discussion and consultation that are probably now best undertaken within the framework of the OECD should move to the global level (IMF), and it may become clear that some kinds of policy co-ordination are sensible among the European countries but not among the advanced countries as a whole. But for the next few years it would seem wise to experiment with new forms of closer consultation and not try to force agreement too soon on a new international monetary system.

Means of Consultations

"The kind of consultation that would seem to be called for is not dramatically different from what has taken place from time to time in the EPC and its Working Parties. During the last couple of years discussions in these OECD committees have ranged widely over most aspects of the demand-management and balance-of-payments policies of the member countries, and in particular of the seven countries that carry most economic weight in the OECD area – the U.S., Canada, Japan, Germany, France, the United Kingdom and Italy. All the key issues – inflation, recession, recycling, capital movements – have been analyzed by the secretariat and the member countries politely invited to consider modifying their policies when the interests of the group, or the good of a particular member country, seemed to point in that direction. What then has been lacking?

Need for Continuous Consultation Among Key Governments

"The main needs now are for a more forthcoming attitude toward the process of consultation on the part of the key governments and for more flexibility in the institutional arrangements. The key governments need to consult together more continuously, to be readier to discuss with one another problems they anticipate and their proposed ways of dealing with them, and to see intergovernmental consideration reach deeper into questions of domestic policy.

"Institutionally, arrangements are needed to make it easier to see and to deal with the inter-related aspects of questions that are now too often looked at and treated separately.

"It is also important that a way be found so that this kind of more intensive, more continuous, more anticipatory discussion can normally take place on a more restricted basis than it has frequently been possible to do in the OECD.

Suggested Adaptations in the OECD

"Specific suggestions about the adaptations in the OECD that now seem to be called for and the prospects for change are considered in a later section. The essential points to be made here are (1) that there is need for an intergovernmental mechanism that can facilitate close, continuing consultation among key governments on the full range of macro-economic policies, and (2) that the governments concerned should not seek to decide in advance what can legitimately be discussed or the nature of the obligations to modify policy that may result from the discussions. Willingness to discuss anything but no prior commitment to do anything are both important, for no one really knows where the stopping points, or breaks, lie on the continuum of policy measures.

Interlinkage of Economies of the Advanced Countries

"For a long time it was assumed that international surveillance of monetary policy could be linked to a country's recourse to the IMF, either for drawings on the Fund or for permission to make a change in par values. Now, despite general floating, it is clear that the need for international surveillance has not been reduced, for the economies of the advanced countries are so interlinked that measures taken in one context (e.g. changes in interest rate to affect domestic demand) have undesirable or unintended results (e.g. on capital movements).

"It is difficult to find rules that are acceptable to everyone for many reasons. But high on the list comes the fact that there are no longer any well-defined and agreed lines to be drawn between policies of domestic concern and policies of broader common concern. Too sweeping a definition of what are matters of common concern inhibits governments too much; but too limited a definition ensures that intergovernmental action will be inadequate.

Difficulty of Drawing Lines Between Domestic and Global Policies

"This difficulty of drawing lines comes through very clearly if one looks at the IMF's current guidelines on floating. Thus, in discussing the term 'action to influence an exchange rate' it is stated that; 'Monetary or interest rate policies adopted for demand management purposes or other policies adopted for purposes other than balance of payments purposes would not be regarded as action to influence the exchange rate'. Perhaps a distinction of this kind must be made if one is trying to draft widely acceptable rules. But it is not a distinction that should be applied to discussions on monetary and general economic policy among that relatively small group of advanced countries which are strongly affected by

changes in each other's interest rates and other measures of domestic demand management.

Drafting Global Rules

"The key advanced countries now need to be willing to discuss with one another virtually all aspects of their macro-economic policy; for, given the way their economies are interlinked, there is no clear place on the continuum of closely related policy measures at which to draw the line and say that policies on one side of the line are always appropriate subjects for intergovernmental discussion while those on the other side of the line never are. Where the line should be drawn will be different at different times and it will be different for different countries. It may still be appropriate when drafting global rules to seek to distinguish between measures taken essentially for domestic purposes and those designed to affect the balance of payments. But in the more intimate, and less formalized, discussions among the advanced countries the test of what is appropriate for discussion must be the effect – anticipated as well as actual – of measures taken or not taken on other countries, not the intent behind the action, or inaction.

The Objective of Consultation

"Multilateral surveillance in the OECD, as in other international organizations, has been one of the most useful techniques of the post-war world. But in several areas – macro-economic policy being perhaps the most important – the advanced countries now need to push beyond surveillance into the much more difficult area of prior consultation. The objective of consultation is not common policies, nor, in many cases parallel policies, but rather policies that are compatible and mutually reinforcing. And, given the great weight of this group of countries in the global system, they must be policies that meet the larger tests of 'global responsibility' – a point which is considered further below." (Ibid.)

Part IX – Governmental Control of the Market

The international economic, monetary and trade systems are all parts of the "new Imperial System" which the elites have constructed to manage the world as one 'integrated' unit. In order to better manage these systems each of the major global institutions – the OECD, IMF, IBRD, GAIT and WTO – must be strengthened and given additional power over the nation-state. The process of bestowal of greater powers upon these institutions is being done slowly in order not to arouse the masses of people in the advanced countries.

Changes in the International System are Being Made Slowly

As Camps points out in the above quotations, governments are not likely to transfer massive portions of economic sovereignty to global organizations all at once. Therefore, changes will be made slowly. Coordination of monetary and

macro-economic policies of the advanced countries will steadily grow as economies are linked together by the elite planners.

The Need for Central Economic Planning

In a section entitled, "Trade and Industrial Policy," Camps points out the need for central economic planning in almost all areas of production at the global level. This means organizations such as the OECD and WTO will be doing the planning. In the "new Imperial System" planned by the elite, government regulation and control of the market is essential in order to maintain the monopolistic policies of the giant corporations. Camps stated:

Trade and Industrial Policy

"During the last few years there have been numerous suggestions, mainly emanating from American sources, that the advanced countries should adopt a goal of tariff-free trade in industrial products, extending the tariff reductions to the less-developed countries without demanding a reciprocal lowering of the latter's tariffs. The U.S. Government has not officially sponsored such a plan, however, and the reactions from other advanced countries, in particular, France, have been cool. The usual argument that tariff-free trade among the advanced countries would eliminate the most solid cement of the common market has been a conspicuous reason for the European lack of response; but the goal of free trade in industrial products tended to attract less interest in the United States and elsewhere as governments became increasingly concerned with the deepening recession and as protectionist pressures became stronger almost everywhere.

Holding on the Gains Made Since World War II in Freeing Trade

"In the last year or two the central need has been to prevent backsliding; and, in the face of recession and the disruption caused by the steep increase in oil prices, the OECD scored an important success in negotiating and later renewing an undertaking that member countries would not seek to improve their own trade position at the expense of others by resort to import controls or export subsidies. For the next year or so it seems probable that the major problem will continue to be to hold on to the gains that have been made since World War II in freeing trade. Perhaps some modest progress beyond that can be made in the context of the Multilateral Trade Negotiations (MTN) in Geneva, although it seems unlikely that the latter will make much headway until after the 1976 elections in the United States.

Working Within the Context of the GATT

"Until such time as the advanced countries decide to go further among themselves than it is possible to do on a broader basis within the context of the GATT, is there need of or scope for institutional arrangements to promote

discussions on trade questions among the advanced countries? It is desirable that countries in difficulty, notably today the UK, be encouraged to resist the temptation to use import controls or, if the temptation cannot in the end be resisted, that the use of import controls be under close multilateral surveillance.

Three Roles for the OECD

"Probably the strongest pressure against a unilateral resort to import controls for members of the European Community is to be found in the Treaty of Rome. But, for so long as it is in effect, the recently negotiated Financial Support Fund provides a very strong incentive to resist their use or only to resort to them in a situation in which use has been explicitly sanctioned as a temporary measure as part of a package arrangement involving large scale recourse to the Support Fund. If a large drawing were to be made on the Fund and the temporary use of import controls sanctioned in that context, it would be reasonable to assume that these would come under surveillance by the Support Fund. But short of this situation, there are three kinds of role for the OECD: the first and most obvious is as a place for the concerting of the views of the advanced countries on trade policies *vis-a-vis* other groups, mainly the ldc's but perhaps also the Comecon countries. The scope for advanced-nation co-ordination prior to encounters with other groups of countries either within global organizations (GATT, UNCTAD) or otherwise is discussed in a later section, and that aspect of OECD action on trade policy will be considered in that context.

Promotion of Rule-Making

"The second role is to promote rule-making in a few areas that are of major concern to the advanced countries but are not ripe for negotiation on a broader basis. Export controls would be a case in point, if effective rules cannot be negotiated in the GATT.

Concern with Industrial Policy

"The third role is of a different order and is probably better described as one concerning with industrial or structural policy. It is perhaps worth explaining what the term 'industrial policy' as used here embraces, and why this approach is suggested. Essentially the expression 'industrial policy' is used to mean those governmental policies that directly affect patterns of production: who produces what, where. Thus it is a way of looking at the whole array of measures – tariffs, subsidies, and other non-tariff barriers (ntb's), environmental controls, special arrangements for particular sectors such as energy or agriculture, company law, regulatory instruments such as anti-trust laws, some aspects of foreign investment, some aspects of science and technology policy – that are designed to stimulate or suppress particular types of production, or that have important effects on the location of industry, whether or not they were designed with that purpose in mind.

The Concept of Central Planning Versus the Free Market

"The concept of indicative planning has long been a familiar one in some countries of the group, France in particular, and for such countries the concept of an industrial policy – a domestic industrial policy – is a commonplace. For other countries, such as the United States and Germany which have been doctrinally opposed to 'planning' and have placed much greater reliance on the market, the need or desirability of even the sketchiest kind of planning remains much more controversial. Does the suggestion that there is a need for intergovernmental discussions on industrial policy require that the countries participating in such discussions have national plans at least in the French sense? If so, it is clear that one would be stirring up a hornets' nest.

Governmental Regulation of Industrial Policy

"The answer would seem to be a qualified 'no', but the argument is a bit circular, for the reason for suggesting that it is useful to focus on industrial policy is precisely because various pressures are forcing governments to be clearer about their priorities and to have a better view of the pattern of production for which they are striving. For whether or not their starting point is something like the French indicative plan the kinds of decisions that the governments of the advanced countries increasingly confront are the ones which will require them to have a view of what kinds of change in their industrial structures they are prepared to accept or to encourage. Technological change, environmental concerns and other constraints on growth, inflation and the drying-up of private sources of investment in some countries (e.g. the UK), high energy costs, and perhaps, an upward trend in the prices of raw materials generally, the activities of the multinational enterprises and the reactions of host countries to those activities, the elimination of indigenous supplies of cheap labor and restrictions on immigration, and the desirable next steps in trade liberalization will all exert pressure in the same direction. So, too, will the increasingly organized pressures from the developing countries for improved access to markets.

Need for Central Economic Planning in Almost All Areas of Production

"In short, for many reasons the advanced countries confront a need to make structural changes in their patterns of production. Some of the needed change (e.g. much of that related to environmental concerns) involves a shift from the production of private to public goods and cannot therefore be left to the market; some of the change probably could in theory be left to the market; (e.g. textiles, automobiles) but given the commitment of governments to social goals it is plain that even the most market-minded of the governments will in fact intervene to moderate the rate of change.

Concern over Each Nation's Industrial Policy

"Clearly, given their high degree of interdependence and, in particular, the overwhelming importance of trade within the group, each country's decisions on measures that affect the pattern of production, whether or not the country has anything that can be legitimately called an industrial policy, are of concern to other members of the group. But there are obvious difficulties in drawing the boundaries for advanced-country action in this field. Some of the difficulties arise from the point made earlier, and which will recur throughout this paper, that the advanced countries are not, and should not be conceived of as becoming in the future, an economic unit. Therefore one should not be seeking to organize relationships in such a way as to maximize economic efficiency for the area as a whole with substantial costs both to national efficiency on the one hand and global efficiency on the other.

Common Interest in Each Nation's Economic Health

"On the other hand, there is a common interest – although not one easily given operational significance – in each other's economic health: as indicated above, this is so not only because each member is affected by developments in the economies of the others but also because the group shares many common values and the key members of the group are linked by various security arrangements.

Coordination in the General Area of Monetary and Economic Policy

"In considering the role for advanced country co-ordination in the general area of monetary and economic policy the chief tension or point of conflict is between action at that level and similar action within the European Community, that is, to some extent they are alternative 'levels' intermediate between the nation and the global system, and extensive coordination of policy at the OECD level may weaken the impetus for co-ordination of policy at the European Community level – so long as the European Community is not clearly set on a course to full economic union. In the case of industrial policy there is some tension between these two levels. But there is likely to be much more risk in the case of industrial policy than in the case of monetary and economic policy that advanced-country co-ordination will not contribute to but create difficulties for the evolution of a more efficient global economy.

The Challenge of Structural Change

"Structural change is always painful, and the temptation will be great to strike internal bargains, to make concessions to one another at the expense of third countries. As commented on further below, this danger can be safeguarded against to some extent by giving greater transparency or visibility to OECD discussions. But it will be difficult to combine a process of more intensive advanced-country

consultations on industrial policies of the kind that now seems desirable with an adequate system of safeguards, given the present disarray on the global level.

International Consultations on Governmental Policies That Directly Affect Patterns of Production

"International consultations on industrial policy have in the past been mostly on a piecemeal or sectoral basis: textiles, steel, energy, agriculture. The last two sectors and perhaps some others will continue to need special attention, but what is being suggested here is rather different: it is really that just as with cyclical or macro-economic policy so with structural or micro-economic policy it is becoming increasingly difficult to draw the line between matters that are of purely national concern and matters that are of legitimate concern to other countries.

New Kinds of Intergovernmental Action Needed

"This means that new kinds of intergovernmental actions are now called for. An indication that the OECD countries are moving, albeit still rather tentatively, toward more concern with industrial structure was the decision at the ministerial meeting in May 1975, following a proposal made by Mr. Kissinger, to establish a special group of 'distinguished economists' (some from within governments, some from outside) to develop longer-term growth strategies for the OECD countries. The motivation behind this suggestion is not altogether clear, but whether or not this was the intent it may prove to be a way of adding to the questions traditionally examined by the EPC in its Working Party 2 (growth policies) and Working Party 4 (price policies) some consideration of the longer-term structural problems which are here being called industrial policy.

Need for Adding Political Reality to the Concept of a Global Economy

"In addition to identifying some of the structural changes that should now be accepted or encouraged – a task which needs to be undertaken whether or not it results from the work of this new group – the advanced countries should also now agree to some arrangements for continuing consultations on the broad lines of their industrial policies. As in the case of macro-economic policy, consultations should rest on acceptance of the fact that many of the measures taken essentially for reasons of domestic industrial policy – controls on or incentives to investment, subsidies, tax policies, etc. – may well be of legitimate concern to others. Some of these questions may be dealt with in the context of the GATT negotiations on non-tariff barriers (ntb's), but little is likely to be done about many questions, for they do not readily lend themselves to rule-making, until there is some political reality to the concept of a global economy. Again, as so often, one runs into the problem of concept when trying to define the purpose of advanced-country consultations.

Integrating the Lower Developed Countries into the Global Economy

"As indicated above, it cannot be to promote an efficient division of labor simply on an advanced-country basis, because the political base for such an approach is lacking and because it would distort further the global distribution of economic functions. But there is nevertheless a process to be started, both because the high degree of interaction among the members of the group legitimates a concern with one another's policies and plans and because more discussion of structure and of the mechanics of managing change is probably a necessary prelude to the shifts in global patterns of production that would seem to be needed if the ldc's are to be integrated into the global economy.

New Commitments on Trade Liberalization Needed

"Looking to the somewhat longer term it seems probable that following the current multilateral trade negotiations under GATT auspices (the so-called Tokyo Round) or, conceivably, in the context of those negotiations, the advanced countries should undertake among themselves new commitments on trade liberalization, a kind of super-code, which would supplement the more generally applicable but more limited commitments of the GATT.

Devising a New Global Institutional Mechanism

"If this were to be done, some institutional mechanism among the advanced countries subscribing to the new code would be needed, and the question would arise whether this was best done by having the new code negotiated and enforced within the OECD framework (as the code on liberalization of invisibles has been) or whether it should be done within the framework of the GATT. The right answer may be that any new super-code should be negotiated in the OECD but then transferred to the GATT, where it would be open to accession by any other GATT member and where the actions taken by the advanced countries among themselves could be subject to continuing scrutiny by the GATT secretariat. This would go some way to reassuring the non-participating countries that the actions taken were consistent with the broader obligations. The difficulty in this solution would come from the close interrelationship between the kind of discussions on industrial policy advocated above and the continuing surveillance of resort to safeguards and escape clauses that would be a necessary part of any new code.

Once Global Rule-Making Becomes Possible

"As is suggested throughout this paper, the OECD's role must be a flexible and supplementary one, filling gaps and experimenting with new kinds of international action. Once 'rule-making' becomes possible and other countries are willing and able to subscribe to the rules, the function should normally be transferred to a broader forum with the OECD making the necessary adjustments in its own program. (*Ibid.*)

Part X – Managing the Lower Developing Countries

From the previous quotes, it should be obvious that the goal of the elite is 'rule-making' at the global level. Camps points out that the elite are even desirous to have the OECD supervise and manage the lower developed countries. Concerning the LDCs she stated:

Relationships with the Lower Developed Countries

"In most of the areas that have been commented on briefly in this paper there is a tension or a contradiction between what it is useful and sensible to do in the short to medium term and the direction in which it is preferable to try to move over the longer term. Perhaps nowhere is this more true than in relationships between North and South, developed and developing, rich and poor, however in precise terms these overlapping but not identical categories of countries are defined. Nor, as a rule, is it desirable to organize collective action among a limited group of countries if other countries are both strongly affected and can themselves become a part of the process without an appreciable sacrifice in terms of the purposes for which co-operative action is sought. There is undoubtedly something that smacks both of paternalism and of selfishness in an organization of rich countries promoting the co-ordination of policies *vis-a-vis* the poor countries: paternalism when it is said to be done mainly for the benefit of the poor; selfishness when it is said to be done in self-protection.

Coordination of Consultations on New International Economic Order

"All that being said, however, there would nevertheless seem to be a strong case today for advanced-country consultation, at a minimum, and beyond that for some co-ordination of policies, not simply on specific measures like investment, aid, and commodity policy, but on the broad question of the strategy to be followed in UN discussions on the 'new international economic order'.

LDC's to Experience Limits of Independence Before Accepting Obligations of Interdependence

"It is an unhappy fact that the ldc's have themselves decided that pressure, confrontation, and the solidarity of the '77' are more likely to bring tangible results than is reliance on the conscience or the enlightened self-interest of the rich countries. If only the short term is considered, they well have been right, for ldc demands stand a good bit higher on all international agenda than they did a few years ago. In any prolonged contest the developed countries would be far stronger than the ldc's, but neither rich nor poor would gain in the end from the distortions in the international economic system that would inevitably result from a prolonged period of confrontation. It may well be, however, that for a time there must be a period of greater cohesion among the ldc's, on the one hand, and of greater cohesion among the advanced countries on the other, and of hard bargaining

between the groups. Very likely the ldc's like the advanced countries must experience for themselves the limits of 'independence' before they can accept the obligations of 'interdependence.'

OECD Should Play an Expanded Role in Coordinating Policies with the LDC's

"There is another, rather different reason for thinking that for several years, at least, the OECD should play an expanded role in co-ordinating policies *vis-à-vis* the ldc's. If no collective strategic thinking about the nature of relationships and no co-ordination of policies takes place among the advanced nations it seems almost inevitable that special arrangements of various kinds will grow up between groups of ldc's and particular advanced countries. In both the short term and the longer term, privileged arrangements of one kind and another seem less desirable – for ldc's and in the interests of harmony among the advance countries themselves – than arrangements that are more generally applicable." (*Ibid.*)

Part XI – The Goals of the Elite

The long-range goal of the "new Imperial System" is to have every nation on earth under the control of a key number of global institutions. The global institutions will then be subservient to the real managers of the world – the international bankers, investment bankers, and corporate directors. Camps outlines the goals of the elite as follows:

Relationships with the Comecon Countries

"Although today it is the advanced countries' relations with the OPEC and the ldc's that call for more co-ordination, it is worth asking whether now or in the future the OECD should have a role either in expanding economic contacts with the command-economy countries or in encouraging more co-ordination of policy among the advanced countries *vis-à-vis* the Comecon group of countries on, for example, trade, credits, joint production arrangements. Partly because of the presence of the neutrals in the OECD, relations with the Soviet Union and the Eastern European countries have not been a natural subject for the OECD. Strategic trade controls have been handled in the COCOM, a subsidiary of the NATO, and any discussions have a security aspect should and doubtless will continue to be handled in that forum. For the rest, there may on occasion be subjects – credit conditions may be one – on which some exchange of views among the OECD countries is desirable, but, for the most part, it would seem desirable to leave East-West economic questions to the UN Economic Commission for Europe.

The Concept Behind OECD

"As has been repeatedly emphasized throughout this paper, the concept behind the OECD should not be one of organizing a bloc of advanced market-economy countries to deal as a bloc with other groups, but rather to enable the advanced countries to perform more efficiently the management of their own interdependence, on the one hand, and to discharge more effectively the responsibility that inevitably rests on them given their preponderant weight in the international economic system. The need to co-ordinate policy *vis-a-vis* the OPEC countries arises mainly from the disruption OPEC policies have caused to the advanced countries' economies; if unexpected developments in Eastern Europe were to cause some comparable disturbance clearly a new situation would be created.

Participation of Eastern European Countries in OECD Activity

"There may occasionally be particular subjects on which some exchange of views among the OECD countries is desirable. There may also be times, as economic exchanges expand, when it would be useful to co-opt one or more Eastern European countries to participate in a particular OECD activity. And, as discussed further below, in their capacity as 'steerers of the system' the key advanced countries must be concerned with the better articulation between all the parts of the emerging global international economy. But short of some disruptive development comparable to the oil price increase, relationships with the Comecon countries as a group, should not, probably, be more central to the work of the OECD in the future than they have been in the past....

A Stronger System of Global Institutions Endowed with Real Power

"It seems likely to be true that a *really* efficient international economic system requires either strong leadership by a single dominant country willing and able to underwrite the system, or strong 'supranational' institutions endowed with real powers. For two decades after the second world war the United States largely underwrote the economic system of what used to be called the 'free world'. That situation no longer exists, partly because the United States is no longer prepared to do the underwriting, partly because U.S. dominance is no longer acceptable to the new centers of economic power – Western Europe, Japan, OPEC – and partly because any 'leadership role', however benign in intent, is repudiated by many within the advanced countries and within the ldc's. Even were the attitudes of the OPEC and many of the ldc's less challenging it would be easy enough to demonstrate that it is unrealistic to suggest that a group of countries meeting intermittently in an intergovernmental organization like the OECD could perform the role of underwriter as, at times, a single power can do or as, perhaps, one day's stronger system of global institutions will do.

The Right Kind of OECD

"Nevertheless, all that being said, given the present diffusion of economic power, the erosion of the rules that provided the 'bones' of the post-war system and the widespread questioning of many of the assumptions underlying the rules, there would seem to be a number of ways in which the right kind of OECD could play a role of some importance in the troubled years that now seem to lie ahead.

Need for Far-reaching Reform of Global Institutions

"There is a need for far-reaching reform of global institutions, but the kind of reform that is needed will not come quickly. There is too much rhetoric, too much passion, too little analysis, too little consensus. Deadlock would be a more probable outcome than agreement if any very substantial restructuring were today attempted. And were agreement attainable it might well be worse than deadlock, for it seems probable that the kind of new arrangements that might be agreed upon today would tend to harden the lines between the four, or five, 'worlds' into which the globe is divided.

Insistence on Unreal Form of National Autonomy and Sovereignty by the Lower Developed Countries

"As suggested above, for a time there may well be resistance on the part of the ldc's to arrangements that reflect the fact of growing interdependence, and they may insist on what they may later discover to be an unacceptably costly form of 'independence'. This ldc insistence on an unreal form of national autonomy and sovereignty seems likely to be matched by a preoccupation with domestic problems in the advanced countries and a corresponding turning inwards.

Two-Track Approach in Constructing a Global Community

"All institutional reform cannot, however, await some ideal moment in the future. Too much interconnectedness exists. If no attempts are made to improve the functioning of the partial and imperfect system that already links economies there will be further deterioration. What is needed now is, therefore, a two-track approach: more analysis and more discussion in an attempt to reach a wider consensus on the essential principles of a reformed international system and also improvements in the way international economic problems are dealt with in the short to medium term, taking care that these short-term improvements do not set in concrete patterns of relationship and principles of conduct that seem likely to prove unworkable or unwise in the longer term.

Achieving a Consensus About the Essential Characteristics of the International System to Guide Government Policy

"The OECD could help move things along on both tracks. For example, more should be done through a process of analysis and discussion to achieve more consensus about the essential characteristics of the international system which should be the goal of policy. This is not a suggestion for an exercise in blueprinting the future or for sketching out 'ideal-type' institutions. Rather the suggestion is that key policy-makers, assisted by the secretariat, should from time to time engage in free-ranging debate and discussions which were not tied to decisions on immediate policy options but were more concerned with the general direction of policy and with what Henry Kissinger would call 'architecture'.

Visions of the Desirable Future

"Such discussions would at a minimum be useful in revealing whether the separate national 'visions of the desirable future' are in fact congruent or conflicting visions. Beyond that, they should encourage among the countries that still carry the greatest weight in the international system more thought about the essential principles of a reformed system. Simply to prepare to engage in discussions of this kind would force some governments that pride themselves on pragmatism and adeptness in responding to events to think in a longer time-span than they normally find congenial about key relationships among states, about which functions should be handled at what level – national, European, advanced-nation, global – about where the market is the right arbiter and the task is to make it perform better, and where it is not and something else is needed, and other fundamental questions.

OECD Best Suited for Discussion on Reform of the International System

"The functions that fall along the second track are closer to the kind of work the OECD already does from time to time, that is actions that the OECD group of countries can take among themselves to help existing organizations perform better, and to plug gaps.

Giving New Impulse and Direction to Global Institutions

"The Rey Committee discussions on the next stages in trade policy and the discussions within the Group of Ten on SDR's are examples of how discussions among the advanced countries can give a new impulse or a new direction to global institutions. The 'trade pledge' taken in the context of the oil crisis was an example of how action by the OECD can be critical in stopping erosion in the broader system. Some of the work of the DAC and some of the current work now underway on commodities and on surveying what is being done elsewhere to help the poorest countries comes under the heading of co-ordination and gap-filling. But more could be done among this group of countries to improve the functioning of the global institutions. Moreover if through the kind of discussions suggested

above they are able to reach more of a consensus on some of the essentials of longer-term reform, stop-gap measures and short-term actions can become part of a purposeful process of piecemeal reform.

Spotting New Problems Before They Become Unmanageable

"There is another related function that also comes under this general rubric of 'system-tending', that is the task of spotting new problems and problems that have long lead-times, and of stimulating work on them before they become critical or unmanageable. Again, the OECD has had some success in this type of work. It was an early entrant into the environmental pollution field; it helped focus attention on the role of science policy in government; it helped separate myth from reality about the technological gap. But although it has played a useful role in identifying and stimulating work in new areas such as these, as an organization it has frequently tended to hang on for too long to whatever activity has been set in train. More effort should be spent on spotting problems and in activating work on questions which are not today urgent but must be acted on today if trouble in the future is to be avoided. But once work has been stimulated, the function should normally be floated off, sometimes to other intergovernmental organizations, sometimes to non-governmental international organizations. Sometimes governments or private organizations once alerted to a problem can simply be left to get on with the job.

"Obviously this kind of activity should not be simply the prerogative of an advanced-country organization like the OECD; it must happen everywhere all the time. But the advanced countries have special concerns and special responsibilities in what might be called the frontier areas. Many problems of general concern tend to hit them first and only they are likely to have the resources – expertise as well as money – required to understand what needs to be done and to try to mobilize appropriate action.

Crisis Management

"Finally, there is a role to be played in crisis management. Both weaknesses in the existing organization and tactical considerations – whether sensible or otherwise need not be debated here – on the part of the U.S. Government led it to seek to deal with the oil crisis in the first instance by organizing the principal consuming countries outside the framework of the OECD. It would not be hard to write a scenario for a better response to a sudden crisis: one element in such a response would be a more flexible institution, another would be a readiness on the part of the key advanced countries to put their common interests above their separate interests, a third would be their recognition of the wider responsibilities they inevitably bear as a consequence of their wealth and economic power for the health and orderly functioning of the wider system. It cannot be said too often that whether it be crisis management, short-term improvements in existing institutions, or planning for institutional reform the advanced countries have an obligation to

look beyond their own welfare. They carry too much weight in the total system to shift the burden of responsibility or to yield to the temptation to write off the wider world as they easy way to respond to intemperate ldc demands." (*Ibid.*)

Part XII – Streamlining the OECD

In the above statement Camps comments on the necessity of supranational "institutions endowed with real power." Camps points out that there is a need for underwriting of the international system. The United States provided the majority of this financial support until 1971. In the future, Camps and the elite planners are hoping to devise some form of global taxing system where citizens of the world would pay taxes directly to supranational institutions. This proposal has already been advanced by Bayless Manning, former president of the Council on Foreign Relations, Harlan Cleveland, Zbigniew Brzezinski, and William McChesney Martin.

Miriam Camps next outlines the steps whereby the OECD may be streamlined for its future role in the New Imperial System. Writing in a section entitled, "A New Organization or an Improved OECD," she states:

The Trilateral Alternative

"The obvious alternative to trying to improve the OECD to play the kind of role envisaged here is to build instead a closer relationship among the key centers of economic power: the U.S., Japan, and the European Community. If the European Community were in fact a European economic union the pressure to move in this direction would probably be irresistible, although it is at least arguable that even in those circumstances a formalization of the triangle would be a mistake.

A Trilateral Institution

"However the European Community is today so far from being an economic union that, somewhat paradoxically, trilateralism meets with resistance, both from those within the Community who do not want to be pushed faster than they are prepared to move toward union and see in any formal trilateralism an external pressure which they could not control, and from some 'Europeans' who fear that an effective trilateral institution would undercut some of the political and economic pressures making for European unity, in much the same ways as Atlantic unity was seen to threaten European unity in the fifties.

The Impact of Trilateralism

"Wholly apart from the resistance that arises from different expectations about the impact of 'trilateralism' upon the evolution of European unity, there is the purely practical difficulty that would arise from the fact that the Community today acts sometimes as One sometimes as Nine and not infrequently gets stuck in

immobility between the two modes. For this reason a variant of trilateralism that is heard in the United States (although seldom in Europe) is a closer relationship between the U.S., Germany and Japan. It is not surprising that this version has been propounded chiefly in the context of the management of international money, for clearly these are today the key countries in the monetary system. But building trilateralism on Germany rather than on the European Community would fatally undercut the latter and tend to revive concern – in Eastern and Western Europe – about the German role. For these reasons it would have few if any responsible adherents in Western Europe and no U.S. Administration would be likely to move, formally at least, in this direction.

Can the OECD Adapt?

"The OECD has been called a middle-aged institution and it has been characterized as an organization of civil servants talking to civil servants. Can it adapt to the kind of role that some advanced-country organization should now be seeking to fulfil, or would it be better to scrap it and create something new? Only governments can decide whether they are prepared to see the kinds of changes made that would enable the existing institution to respond to the needs of the future; if they are, self-regeneration should be possible. If they are not, it is unlikely that a new institution would prove to be much more of a success.

Reasons Why Adaptation of OECD Would Be Better Than Starting Anew

"No one would, today, invent the OECD with precisely its present membership, its extensive array of 'vertical' committees, its highly compartmentalized secretariat. There are good historical reasons why the institution is as it is; but no compelling reasons – other than the force of inertia – why the changes that now seem to be desirable cannot be made. If it can be accomplished, there are at least three interrelated reasons why adaptation would be better than starting new.

Desirable Not To Harden Lines

"First, as constantly reiterated throughout this paper, it is desirable not to respond to the current irresponsible tactics and exaggerated claims of the ldc's by hardening lines. The formation of a new advanced-country organization would inevitably be seen as a step in this direction.

Changes in Membership

"Second, the category of 'advanced countries' is changing. On the face of it, Brazil might well seem a more obvious candidate for membership in an advanced-country institution than Greece. Yet today the network of economic relationships and the attitudes of governments are such that, to put it at its lowest, neither the *presence* of Greece nor the *absence* of Brazil is much of a hindrance to effective advanced-country co-ordination of policy. This situation is changing, and it may

well be that changes in membership at some time will become imperative. If that becomes the case, the arguments for a new organization would be appreciably stronger, for it is exceedingly difficult to make radical changes in the membership of an existing organization. But, for the present, the membership problem is probably best dealt with through more use of restricted committees and some co-optation of countries for particular purposes.

Desirability of Working Toward a Reorganized Global Institutional System

"Finally, looking to the longer term, it seems to me to be doubtful whether a separate advanced-country institution should be a part of the reorganized global institutional system that it is desirable to try to work towards over the next decade or two. Rather, it seems likely to be better to think of advanced-country tiers or chambers in a number of interrelated global functional organizations.

An Eventual Global System

"In any case, the need now is not to move to arrangements that will approximate the kind of institutional arrangements that will approximate the kind of institutional arrangements that may characterize a reformed eventual global system, for views on that have yet to crystallize. Rather, the immediate need is for an adaptable, flexible instrument which can facilitate advanced-country co-ordination of policy, an organization which is willing to experiment with new techniques for fostering collective international action but one which will not stand in the way of the evolution, over time, of more effective global institutions.

Two OECD Problems

"In the self re-examination that has been occurring in the OECD during the last year or two, much attention has been given to two linked problems: how to improve the decision-making power of the organization, and how to avoid work being unduly slowed down or paralyzed by the desire of all countries to participate in everything. The insistence of the United States Government on setting up both the IEA and the Financial Support Fund *not* as subsidiary bodies of the OECD (although loosely linked to the OECD) was in large measure a reflection of the desire to have a stronger more operational form of organization that the OECD framework seemed likely to provide. Both the new organization shave limited memberships and both have weighted majority voting. Although both new institutions will have operational functions in certain circumstances, neither may in fact play an operational role if there proves to be no need to invoke energy sharing arrangements or to mount a major financial support operation.

Future Expansion of OECD

"It is possible that in the years ahead there may be other areas where it is desirable for the OECD to acquire operational functions itself or to spawn an

operational agency. But this seems likely to be an exceptional need. For the most part, as indicated in the discussion on functions, the OECD should now not be playing an operational role; indeed, it should usually be true that when any activity becomes operational it should be transferred from the OECD to some other institution, e.g., GATT, IMF, the UN, or floated off as a self-sufficient operation.

Five Main Tasks for OECD

"The OECD should itself concentrate on four or five main tasks: it should (1) serve as a forum for more intensive and continuing consultation on those aspects of economic policy – mainly macro-economic policy but also, and probably increasingly, industrial policy – that although undertaken mainly for domestic purposes have repercussions throughout the international economy and in particular on the economies of the other advanced industrial countries; (2) largely growing out of the discussions envisaged under (1), attempt to see whether there are procedures that can be adopted or principles that could be codified: in most cases once rule-making becomes possible the function should be transferred to a global forum such as the IMF or GATT, although there may be cases in which the new code will remain for an appreciable time simply a compact among the OECD countries; (3) formulate a strategy in response to the pressures for a 'new international economic order' and provide some co-ordination of policies among the advanced countries *vis-à-vis* the ldc's being mindful of all the caveats to which attention has been drawn in the earlier discussion on this point; (4) promote collective strategic thinking about emerging problems and how they can best be handled, extending from crisis management, as in the case of oil, at one end of the spectrum to long-range planning for institutional reform at the other. And, finally, (5) as a consequence of, and a deliberate part of all the foregoing, it should seek to provide a measure of 'steering' or leadership to the broader international system." (*Ibid.*)

Part XIII – The Concept of Nationalism

Miriam Camps closes her essay on the OECD by lamenting the fact that in today's world where national political and economic sovereignty are still a real force, global institutional reform is to be a slow evolutionary process. Camps outlined that:

"Reflections such as these suggest that institutional reform will be an evolutionary process, not a 'new Bretton Woods'. They also point to several general principles that should underlie the process. Perhaps the first principle and the one that it will be hardest to follow is that one must try to build into any new or reformed global institutions much more potential for evolution and for self-adaptation than has been usual. A second principle is that the global institutions must combine the discipline of common rules with the ability to tolerate differences: both the differences that arise from different values and the differences

that arise from the fact that societies at different stages of development want and need different things. The third and fourth principles are that although primacy must be given to the global system, the global boat must not be overloaded.

Piecemeal Construction of the Global Community

"Somewhat more concretely, these principles suggest that we should be working towards a capacity for global 'steering', global ground rules for the main sectors of world economic activity, but a large measure of ancillary, decentralized, more intensive co-operative action – sometimes regional, sometimes functional – coupled with 'global cognizance' of the decentralized parts of the system. For some functional areas, e.g. money, more can and must be done in the near-term on the global level than in other functional areas, e.g. industrial policy. But global rules wherever they exist should be over-riding and global cognizance a 'right'. This may mean that a desirable way to structure some global institutions will be in tiers or chambers so that countries desiring and able to go further among themselves in any area covered by global rules (e.g. trade liberalization) can do so, but that adequate machinery will exist for ensuring consistency between these actions and the global rules, and, more importantly, for making it possible for other countries to know what is happening and to have some recourse if affected. Thus it may be that eventually some of the functional tasks of the OECD (e.g. co-ordination of macro-economic policy) should be carried out by one tier or chamber in a reformed global institution and that the kind of 'steering' role suggested above for the OECD in the near-term future should be done on a global level by a rather differently composed group of countries.

Need to Give Coherence to the Present Network of Global Economic Relationships

"But speculations such as these take us well beyond the scope of this paper. For the next few years the question is whether the OECD can become the flexible, experimental, *unusual* institution which could help serve as well the wider purpose of giving coherence to the confused network of global economic relationships: or whether, after the brief period in the limelight it has recently enjoyed, it will slowly decline into irrelevance." (*Ibid.*)

Part XIV – Conclusion

One of the main purposes of the OECD is surveillance, consultation, and harmonization of the macro-economic policies of the leading industrial nations of the Western world. It acts in close collaboration with those responsible for economic summitry in the seven advanced nations. It also works closely with the IMF (Committee of 20) and the central bankers in G-10 (ten Western nations). It has also worked extensively with the Finance Minister or G-7 (seven advanced nations). Its overall purpose is to integrate the economics of the advanced Western nations into a "single unit" for collective management purposes.

The OECD is one of the key global institutions instituted by the elite for controlling the international economic system. In the future we can expect it to become more streamlined and strengthened to aid the elite financial oligarchy in governing the Western world. Of course, the reader is aware that once you successfully control the most advanced nations on earth – the less advanced nations will follow the established rules and policies if they want to be partakers of the fruits of the system. The only alternative is to face replacement by officials who adhere to the rules and rulers of the New Imperial system which is slowly being constructed by the global elite.

13. International Monetary Fund – Moving Toward a Global Central Bank

Part I – Introduction

In 1944 the elite post war planners of the western world gathered in Bretton Woods, New Hampshire to devise a new world monetary system. At the center of the Bretton Woods System is the International Monetary Fund. The IMF is a global institution designed by the international bankers, investment bankers and corporate directors to supervise and manage the international monetary system created by the international bankers, investment bankers, and corporate directors. The IMF was designed to eventually evolve into a global central bank with the power to create and eliminate international liquidity and to control the activities of national central banks – a move which would reduce nation-states to mere administrative economic units in a "new Imperial System."

Admittedly, this is quite a chore, even for the elite power structure. The elite nevertheless feel that their long-range goal can be accomplished through patience and piecemeal functionalism.

The Protector of the International Monetary System

The IMF has evolved from an international institution providing adjustment assistance to countries that experience short-term balance-of-payment difficulties to a policeman and protector of the international monetary system. The IMF also acts as a "lender of last resort" for the large global banks ensuring their stability. National governments, especially Europeans and the American Congress, have traditionally refused to transfer control over their economies to the IMF, however, in recent years this trend has been reversed as the IMF has grown in influence as a result of its new "economic surveillance" power.

Part II – Overview of the IMF

The IMF performs a great many functions today. A recent pamphlet provides the following overview:

The Purposes of the Fund

"i. To promote international monetary cooperation through a permanent institution which provides the machinery for consultation and collaboration on international monetary problems.

"ii. To facilitate the expansion and balanced growth of international trade, and to contribute thereby to the promotion and maintenance of high levels of employment and real income and to the development of the productive resources of all members as primary objectives of economic policy.

"iii. To promote exchange stability, to maintain orderly exchange arrangements among members, and to avoid competitive exchange depreciation.

"iv. To assist in the establishment of a multilateral system of payments in respect of current transactions between members and in the elimination of foreign exchange restrictions which hamper the growth of world trade.

"v. To give confidence to members by making the general resources of the Fund temporarily available to them under adequate safeguards, thus providing them with opportunity to correct maladjustments in their balance of payments without resorting to measures destructive of national or international prosperity.

"vi. In accordance with the above, to shorten the duration and lessen the degree of disequilibrium in the international balances of payments of members.

Introduction

"The International Monetary Fund is an organization of countries that seeks to promote international monetary cooperation and to facilitate the expansion of trade, and thus to contribute to increased employment and improved economic conditions in all member countries.

"To achieve its purposes the Fund has a code of economic behavior for its members, makes financing available to members in balance of payments difficulties, and provides them with technical assistance to improve their economic management. At present, the Fund has 140 member countries, accounting for about four fifths of total world production and 90 per cent of world trade.

Surveillance of Exchange Rate Policies by the IMF

"Member countries undertake to collaborate with the Fund and with each other to assure orderly exchange arrangements and a stable system of exchange rates, together with a multilateral system of payments that is free from restrictions and thus promotes balance in the payments among countries. Members are free to

choose the form of exchange arrangements that they intend to apply, subject to their obligations to the Fund and to its surveillance of their exchange rate policies.

"The fund maintains a large pool of financial resources that it makes available to member countries – temporarily and subject to conditions – to enable them to carry out programs to remedy their payments deficits without resorting to restrictive measures that would adversely affect national or international prosperity. Members make repayments to the Fund so that its resources are used on a revolving basis and are continuously available to countries facing payments difficulties. The policy adjustments that countries make in connection with the use of Fund resources support their credit worthiness and thus facilitate their access to credit from other official sources and from private financial markets.

"Both the regulatory and the financing features of the Fund's policies contribute to the promotion of adjustment of imbalances in members' international payments. These policies evolve in response to changing world economic conditions and the needs of Fund members. They apply equally to all member countries, whether industrial or developing, whether their payments are in deficit or surplus, and regardless of their economic system.

The IMF Assists Nations with Balance of Payment Problems

"To enable the Fund to carry out its policies, member countries continuously supply it with a broad range of economic and financial information, and the Fund consults regularly with each member country on its economic situation. The Fund is therefore in a position to assist members in devising corrective steps when, or preferably before, problems arise in their balance of payments.

"Having responsibilities for the international payments system, the Fund is particularly concerned with global liquidity – that is, the level and composition of the reserves that members have available for meeting their trade and payments requirements. In 1969, the Fund was given the responsibility for creating and allocating special drawing rights (SDRs), the only worldwide reserve asset established by international agreement.

The IMF Helps Nations to Coordinate Their National Economic Policies

"The Fund helps members to co-ordinate their national economic policies internationally. In effect, it provides a permanent international monetary forum. The focus of the Fund is not only on the problems of individual countries, but also on the structure of the international monetary system and on the development of policies and strategies through which its members can work together to ensure a stable world financial system and sustainable economic growth.

Structure

"The Fund is based on an international treaty, its Articles of Agreement, that was drafted initially at a conference of 44 nations held in Bretton Woods, New Hampshire, U.S.A., July 1-22, 1944. The Articles have since been amended twice, in 1969 and in 1978.

Close Working Relationship Between the IMF, IBRD, GATT and BIS

"Membership in the Fund is a prerequisite to membership in the World Bank (International Bank for Reconstruction and Development), and close working relationships exist between the two organizations, as well as between the Fund and the General Agreement on Tariffs and Trade and the Bank for International Settlements. The Fund is a specialized agency within the United Nations system, cooperating with the UN on matters of mutual interest.

The Voting Power of Each Nation

"The work of the Fund is carried out through a Board of Governors, an Executive Board, a Managing Director, and a staff. Each member country is represented by a Governor and an Alternate Governor on the Board of Governors, which is the Fund's highest authority and which meets annually and may cast ballots by mail or cable between meetings. A member country's voting power primarily reflects its contribution to the Fund's financial resources, which, in turn, is related to its relative size in the world economy. The largest member, the United States, has 19.83 per cent of the total voting power, and the smallest member countries each have considerably less than 1 per cent.

"The daily business of the Fund is conducted by an Executive Board of 21 Executive Directors, chaired by the Managing Director, at its headquarters in Washington, D.C. Among other duties, the Executive Board acts on requests by members for financial assistance, conducts consultations with members, takes decisions on general Fund policies, and makes recommendations to the Board of Governors on matters requiring a vote of the Governors, such as the admission of new members and increases in the Fund's resources.

Five Nations Possess the Largest Voting Power in the IMF

"The five members having the largest voting power – the United States, the United Kingdom, the Federal Republic of Germany, France, and Japan – each appoint an Executive Director. In addition, the Fund's two largest creditor members may appoint an Executive Director if they are not among the five members having the largest voting power; currently, Saudi Arabia appoints an Executive Director on this basis. Fifteen Executive Directors are elected for two-year terms by groups of other member countries. The elections take place in alternate years at the time of the Annual Meeting.

Reform of the International Monetary System in 1974

"Since the early 1970s, the international monetary system has undergone major changes. During this period, the Board of Governors has been advised by special committees of its members. The first such group, the Committee on Reform of the International Monetary System and Related Issues (the Committee of 20), negotiated for two years without achieving a plan for comprehensive reform of the system, but in 1974 it recommended a series of immediate steps in a process of evolutionary reform. Further negotiation in a successor body, the Interim Committee on the International Monetary System, led to the Second Amendment of the Articles of Agreement, which entered into force April 1, 1978.

World Economic Conditions Monitored by IMF

"The Interim Committee, a 21-member ministerial-level group paralleling the structure of the Executive Board, meets two or three times a year, keeping under review world economic conditions, the international monetary system, and the role of the Fund.

"The Executive Board appoints the Fund's Managing Director, who serves both as its Chairman and as chief of the operating staff of the Fund, with a five-year term of office. The present Managing Director, J. de Larosiere of France, is the Fund's sixth Managing Director.

The IMF is Comprised of International Civil Servants

"The professional and administrative staff of the Fund is comprised of international civil servants, appointed by and owing their duty exclusively to the Fund. The Fund's professional staff consists primarily of economists, but there are, among others, accountants and legal experts. They are recruited on a wide geographical basis from the Fund's member countries. The staff numbers about 1,500 located mainly at the Washington headquarters.

Office of the IMF

"The staff is organized in five area departments (for Africa, Asia, Europe, the Middle East, and the Western Hemisphere) and a number of other departments (Administration, Central Banking Service, Exchange and Trade Relations, Fiscal Affairs, IMF Institute, Legal, Research, Secretary's, and Treasurer's). In addition, there is a Bureau of Language Services and a Bureau of Statistics. The Fund also maintains small permanent offices in Paris and Geneva and at the United Nations in New York.

Surveillance of Exchange Policies

"The Fund has the responsibility to ensure the effective operation of the international monetary system. To that end, it oversees the compliance of members with their obligations to collaborate with the Fund and with each other to ensure orderly exchange arrangements and to promote a stable system of exchange rates. Members must direct their policies toward orderly economic growth with reasonable price stability and foster orderly underlying conditions for economic and financial stability.

Guidance of Nation-State Exchange Policies

"In order to carry out its responsibility, the Fund exercises surveillance over the exchange rate policies of members. For this purpose the Fund has adopted principles for the guidance of member' exchange policies and has established procedures by which it exercises surveillance. These principles and procedures are designed to identify, and encourage the correction of, in appropriate exchange rate policies.

"In choosing the form of exchange arrangements that they wish to apply, member countries may allow the exchange rate of their currency to fluctuate or they may adopt arrangements that keep the exchange rate fixed in terms of other currencies. Such arrangements include pegging the exchange rate of a currency to the rate of another currency, or to the SDR – which is valued in terms of a basket of 16 currencies – or to some other basket of currencies. Yet another type of exchange arrangement is that of the European Monetary System, under which a group of countries observes fixed margins for the currencies within the group and allows the rates for these currencies to fluctuate with respect to currencies outside the group.

Consultation

"The Fund conducts a consultation with each member country – in principle, annually – to appraise the member's economic and financial situation and policies. Consultations are a primary means through which the Fund fulfills its obligation to exercise surveillance of members' exchange rate policies. They also help to keep the Fund in a position to deal promptly with members' requests to use Fund resources and with proposed changes in exchange practices that are subject to approval by the Fund. Members also provide the Fund with a steady flow of information on their economies, some of which is disseminated to the public in the Fund's publications.

"Consultations begin with meetings in the member country between Fund staff and representatives of the member government. On the basis of these discussions, the staff prepares a report for the Executive Board. Consultations end with a conclusion formulated by the Managing Director, expressing the views of the Fund

on the member's economic situation and policies, and this conclusion is transmitted to the member government by the Fund.

Coordination of Domestic Economic Policies at the International Level

"Recent years have been marked by unusually severe problems of international adjustment, resulting from persistent high rates of inflation and low utilization of productive capacity in many member countries. These global problems have required increasingly that members seek to coordinate their domestic economic policies at the international level. In order to contribute to this effort, the Fund staff conducts special consultations from time to time with members whose policies are of major importance to the world economy. This is done in preparation for the frequent reviews of the world economic outlook by the Executive Board and the discussions of the world economy at the meetings of the Interim Committee and the Board of Governors.

Coordinating the Policies of the Nation-State

"The reviews of the world economic outlook are a principal means by which the Executive Board monitors developments in the international monetary system and the consequences for the world economy that arise from economic policies of major countries and groups of countries. These reviews also help to ensure a better functioning of the international monetary system by bringing into focus the need for coordinating the policies of members, as well as providing the means for coordination.

Quotas and Resources

"The Fund's system of quotas is one of its central features. Quotas are used to determine the voting power of members, their contribution to the Fund's resources, their access to these resources, and their share in allocations of SDRs. A member's quota reflects its economic size in relation to the total membership of the Fund. Each member pays a subscription to the Fund equivalent to its quota, and the Board of Governors decides on the proportion to be paid in SDRs or in the member's currency.

Quotas of IMF Members

"Quotas of all Fund members are reviewed at intervals of not more than five years. Several general increases have been agreed in the past to bring Fund quotas in line with the growth of the world economy and the need for additional international liquidity, while special increases from time to time have been agreed to adjust for differing rates of growth among members and for changes in their relative economic positions....

Financial Facilities

"The financial resources of the Fund are available under a variety of permanent and temporary facilities to help members meet balance of payments needs.

"When a member uses the Fund's resources under any of these facilities, the mechanics of the transaction are as follows. The member uses its own currency to purchase from the Fund an equivalent amount of the currencies of other members, or SDRs. The currencies or SDRs drawn from the Fund are used to finance the drawing member's balance of payments deficit. After a member has made a drawing, the fund holds more of the member's currency and less of the currency drawn, or of SDRs.

Use of SDR's

"Within a specified period – or earlier if the member's balance of payments and reserve position improves – the member must repurchase from the Fund its own currency that it paid to make the drawing. In repurchasing, the member uses SDRs or the currencies of other members specified by the Fund.

"When a member country's currency is used by other members, the Fund's holdings of the currency may fall below the amount of the member's quota. This results in the member's having a reserve position in the Fund that is termed the reserve tranche. This amount is highly liquid, and, if drawn upon, the drawings need not be repurchased. If the Fund's holdings of the member's currency fall below a specified level, the Fund pays remuneration to the member for the use of its currency. The rate of remuneration is related to short-term money market interest rates and is reviewed quarterly by the Fund.

I. Basic Credit and Extended Facilities

"Under the Fund's basic facility, the credit tranches, a member may normally draw up to the amount of its quota, thus raising the Fund's holdings of its currency from the equivalent of its quota up to 200 per cent of this amount. When a member country suffers from structural imbalances in production, trade, or prices, so that adjustment requires a longer period and larger resources than are normally permitted under basic credit policies, the member may make use of the extended facility, under which it may purchase up to 140 per cent of its quota.

"Drawings are generally made under lines of credit called stand-by or extended arrangements, depending on whether the basic or extended facility is used. Under a stand-by arrangement, drawings normally take place over a period of one year, but may also be made over a period of up to three years, while under the extended facility, they are usually made over a period of three years. Under the basic facility, repurchases must begin three years after the drawings and be completed within five

years after drawings are made; under the extended facility, repurchases begin after four years and end no later than ten years after the drawings.

Drawings by IMF Members

"Drawings under all permanent facilities, except for reserve positions, are subject to a one-time service charge of 0.5 per cent, plus a charge at an annual rate that rises with the length of time during which the drawing is not repaid. These charges are maintained at lower levels than market interest rates, in keeping with the Fund's policies under which members cooperate to promote balance of payments adjustment. At present, the annual rate for the use of the basic facility ranges from 4.375 per cent for the first year of 6.375 per cent in the fifth year. For holdings drawn under the extended facility, the same scale of charges is applied, but an annual rate of 6.875 per cent is charged starting in the sixth year.

Income of the IMF

"The income that the Fund receives from charges on drawings under its permanent facilities is used to pay remuneration to creditor countries for the use of their currencies and to meet the Fund's operating costs. Any surplus may be used to increase remuneration or reduce charges, or it may be added to the Fund's regular resources or distributed to its members in proportion to their quotas. If there is a deficit in any six-month period, the Fund is required to review all aspects of its financial position, including the rate of remuneration and its charges.

"When a member receives financial assistance under the basic and extended facilities, it must adopt a program to overcome its payments imbalance. This aspect of Fund policies is known as conditionality. As a minimum, a member is expected to show the Fund that it is making a reasonable effort to overcome its difficulties. If a member's balance of payments need grows larger in relation to the size of its quota, it is likely to require a greater adjustment effort to remedy the imbalance, and the program that the member agrees with the Fund therefore requires more substantial justification. Under such circumstances, the Fund's financial assistance is disbursed in installments according to performance under the program. Performance is measured by broad economic and financial criteria, such as the member's policies regarding credit, government financing, external borrowing, and trade and payments restrictions.

Helping Members to Devise Adjustment Programs

"The Fund encourages members developing payments problems to promptly adopt corrective measures that can be supported by Fund resources. Early action is emphasized because, as a country's economic and financial imbalances become widespread and deep seated, it must usually take more basic, and therefore more difficult, steps to correct them. In helping members to devise adjustment programs,

the Fund pays due regard to their domestic social and political objectives, economic priorities, and circumstances.

II. Special Facilities

"The Fund makes resources available under two permanent special-purpose arrangements – the compensatory and the buffer stock financing facilities – and under a temporary supplementary financing facility.

Compensator Financing

"Compensator financing is available to members facing payments difficulties resulting from temporary shortfalls in their export earnings that are largely due to conditions beyond their control, such as falling commodity prices and natural disasters, including bad weather. Buffer stock financing assists members having payments difficulties to finance their contributions to international buffer stocks that are maintained to stabilize world markets for commodities, such as those for tin, cocoa, and sugar. Charges for drawings under these two permanent facilities follow the same schedule as those for basic credit facility drawings.

The Purpose of Supplementary Financing

"To meet particular needs, temporary facilities have sometimes been established. For example, members drew SDR 6.9 billion (about US\$9 billion) under temporary oil facilities set up to help meet balance of payments needs resulting from higher oil prices in 1974 and 1975. At present, the Fund makes further resources available under its supplementary financing facility to assist members facing payments imbalances that are large in relation to their quotas. Resources under this facility are provided in conjunction with drawings under the basic credit and extended facilities. For the purpose of supplementary financing, the Fund has borrowing agreements in effect with 14 members or official institutions, under which it may borrow up to a total of SDR 7.784 billion (about US\$10.1 billion). Charges for the use of such temporary arrangements are established to cover the costs to the Fund of the borrowed resources. These costs are related to market interest rate levels and are therefore considerably higher than charges for the use of the Fund's own resources.

"Depending upon the type and combination of facilities under which a member uses Fund resources, its drawings may reach five times the amount of its quota. Under exceptional circumstances, additional amounts may be provided through the supplementary financing facility.

Special Drawing Rights

"The SDR is an international reserve asset created by the Fund, taking account of the global need to supplement existing reserve assets. SDRs were created in

1969 under the First Amendment of the Articles of Agreement, in response to widespread concern over the adequacy of the growth of international liquidity. It is the declared intention of member countries that the SDR should eventually become the principal reserve asset in the international monetary system.

Allocations of SDRs

"Allocations of SDRs are made in proportion to their quotas to member countries that are participants in the Special Drawing Rights Department. The first allocations of SDRs, totaling SDR 9.3 billion, were made in the years 1970 to 1972. Allocations of SDRs were resumed with the creation of SDR 4 billion on January 1, 1979. A further SDR 4 billion was allocated on January 1, 1980. After another allocation of SDR 4 billion scheduled for January 1, 1981, SDRs in existence will total SDR 21.3 billion, about 6 per cent of present international reserves, excluding gold.

Publishing Exchange Rates in SDRs

"The method of valuation of the SDR is determined by the Fund. Since July 1974, the SDR has been valued on the basis of market exchange rates for a basket of currencies. The present basket consists of the currencies of the 16 members with the largest share in world exports. Each business day, the Fund publishes the exchange rates of a wide range of currencies in terms of the SDR, and these are reported by a number of daily newspapers and wire services as well as in the fund's twice-monthly *IMF Survey* and in *International Financial Statistics*, its monthly statistical publication.

"A participant may use SDRs, without limitation, in a wide and increasing variety of ways by agreement with another participant – for example, to obtain currency in a spot transaction, for the settlement of a financial obligation, as a long, as security for a loan, as a swap against currency, or in a forward exchange operation. In addition, if a participant has a balance of payments need, it can use its SDRs to obtain usable currency from another participant designated by the Fund. A participant may also use SDRs to make payments to the Fund, such as repurchases, and the Fund itself may transfer SDRs to a participant for various purposes, including transfers of SDRs instead of currency to a member using the Fund's resources.

"A participant with holdings of SDRs in excess of its allocations earns net interest on the excess, and a participant with holdings below its allocations pays charges at the same rate on its net use of SDRs. The interest rate on the SDR is related to short-term money market interest rates and is reviewed quarterly.

"A participant may use all of its SDR holdings and is not obliged to reacquire SDRs according to any fixed schedule. However, under the rules for reconstitution

of SDR holdings, a participant is required to maintain a minimum average level, presently 15 per cent of its SDR allocations.

The SDR is the Unit of Account for the IMF

"The SDR is the unit of account for all purposes of the Fund. Outside the Fund it is widely used as a unit of account in private contracts, such as SDR-denominated deposits with commercial banks, as well as in international regional organizations, including the African Development Bank, the Asian Development Bank, the Arab Monetary Fund, the Asian Clearing Union, the Economic Community of West African States, the Islamic Development Bank, and the Nordic Investment Bank.

Nations Peg Their Currency to the SDR

"A number of the Fund's member countries have decided to peg their currency to the SDR. The value of the currency is fixed in terms of the SDR, then set in terms of other currencies by reference to their SDR value as calculated daily by the Fund....

Gold Sales and Trust Fund

"Efforts in recent years to reform the international monetary system have included steps to gradually reduce the monetary role of gold. These measures included abolishing the official price of gold and any requirement that members make payments to the Fund in gold. In addition, the sale of 50 million ounces of gold – a third of the Fund's gold holdings at the time the agreement was reached on August 31, 1975 – was undertaken in a four-year program through May 1980.

"Half of the gold (25 million ounces) was sold directly at the former official price of SDR 35 an ounce to the countries that were members of the Fund at the time of the agreement. These sales were completed in early 1980.

"The other 25 million ounces are being sold for the benefit of developing countries in public auctions from June 1976 through May 1980. Each of the 104 eligible developing countries receives part of the profits from these gold sales directly, according to the ratio of its quota to total Fund quotas as of August 31, 1975. The remaining profits finance concessionary loans from a Trust Fund, which was established to provide additional balance of payments assistance to developing countries that are eligible because of their low per capita income and qualify for assistance on the basis of adjustment programs agreed with the Fund.

"By April 1980, the auctions of 24.5 million ounces of gold had yielded more than SDR 3.5 billion (US\$4.4 billion) for the benefit of developing countries, including about SDR 1.64 billion (US\$2.1 billion) in disbursements to 49

developing countries from the Trust Fund during three-and-a-half years of the four-year program.

Technical Assistance

"Member countries of the Fund in various stages of development make use of its technical assistance on many subjects related to improving the management of their economies. Experts sent to member countries by the Fund advise on central and general banking, fiscal, monetary, and balance of payments policies and statistics, accounting, exchange and trade systems, and operational aspects of Fund transactions and policies.

"The Fund has provided technical services at the request of members since its earliest years, and at present technical assistance is provided through consultations, special technical assistance missions, resident representatives from the Fund staff, and experts recruited from outside the Fund. The Central Banking Service, the Fiscal Affairs Department, and the IMF Institute were established in 1964 to broaden and coordinate the increasing technical assistance given by the Fund. Other departments also continue to provide technical assistance, and the Central Banking Service and the Fiscal Affairs Department participate in a wide range of other Fund activities.

"The IMF Institute is a department of the Fund whose purpose is to improve the expertise of officials from member countries in the use of modern tools of economic analysis, in the management of economies, and in Fund procedures and policies. Training courses on financial analysis and policy, balance of payments methodology, and public finance are conducted at the Fund's headquarters in English, French, and Spanish. "Some 2,500 officials from nearly every member country have completed such courses since the founding of the IMF Institute, which also provides assistance in its areas of competence to regional and national training centers.

Publications

"The Fund has an active publications program that includes regular and special reports, statistical bulletins, books, periodicals, and pamphlets. The purpose of the program is to further the Fund's work and to carry out its obligation to act as a center for the collection and exchange of information on monetary and financial problems.

"The *Annual Report* of the Executive Board to the Board of Governors, published in September for use at the Annual Meeting, reviews the Fund's activities and presents an up-to-date analysis of developments in the world economy and in the international monetary system. The *Annual Report on Exchange Arrangements and Exchange Restrictions*, published in August, reviews developments in exchange restrictions and trade practices having direct

implications for the balance of payments of member countries. It includes country-by-country descriptions of the exchange systems of most countries of the world.

The IMF is the Principle Source of International Comparable Statistics on National Economies

"The Fund is a principal source of internationally comparable statistics on national economies, including financial and economic data that are relevant to the analysis of countries' monetary and payments problems. Consequently, statistical publications form a major part of the Fund's publications program. In addition to each country's transactions and operations with the Fund, the statistics published include, among others, data on exchange rates, international reserves, money and banking, prices, production, external trade, wages and employment, balance of payments, government finance, and national accounts. These areas are all covered in the monthly and annual issues of *International Financial Statistics*, which is published in English, French, and Spanish. The *Balance of Payments Manual* (fourth edition, 1977) specifies the methodology to be used by member countries in computing and reporting balance of payments data; the detailed data collected by the Fund are given in the monthly and annual issues of the *Balance of Payments Yearbook*. Detailed data on government finance statistics are given in the *Government Finance Statistics Yearbook* and on external trade in the monthly and annual issues of *Direction of Trade*. Computer tape subscriptions to each of these statistical publications are available.

A Repository of Knowledge on Economic and Financial Matters

"As a repository of knowledge on economic and financial matters and because of the close relations that it maintains with its members, the Fund is well placed to carry out a program of research into economic and financial problems. The results of some of these studies are published in *Staff Papers*, the quarterly economic journal of the Fund.

"The *IMF Survey*, published twice a month in English, French, and Spanish, reports developments in the Fund and the international monetary system in the broader context of world economic and financial news, including changes in countries' policies. A quarterly magazine, *Finance and Development*, published jointly by the Fund and the World Bank, carries articles on topics related to the interests of the two institutions. (Official document, *The International Monetary Fund – Purposes, Structure and Activities*, Washington, D. C.: International Monetary Fund, April 1980, pp. 2-30.)

Part III – Efforts to Strengthen the IMF

The IMF is an instrument of the global elite – the international bankers, investment bankers and corporate directors. They designed, built and now supervise it. The elite financial oligarchy also selects its key officials and guide its

major policies. Those who serve as Secretaries of the Treasury, Finance Ministers, Managing Directors, etc., of various governmental systems in the world both at the national and international level are merely the managers of the system. In recent years a number of people have been calling for a strengthening of the IMF. In 1977, Cary Reich outlined some of the IMF goals which the elite would like to see instigated in these words:.

"...Now that the world has rediscovered the IMF, no time is being wasted in mapping out all sorts of grand designs for it. The IMF is being promoted as the answer to the lcd problem, as the friend and protector of the international banking system and ultimately as the 'tough cop' who will 'lay down the law' (in the words of America's *Fortune* magazine) to laggard finance ministers and recalcitrant central bankers....

"Commercial bankers – want the IMF to be a major source of financing....

"Many bankers want more from the IMF – much more. A variety of leading commercial bankers, on various occasions in the past several months, have called for formal lending links between the IMF and the banks; closer exchange of information between the two sides; the use of the IMF as an international credit-rating agency; IMF mediation in debt-rescheduling talks; and above all, a more activist stance by the IMF in monitoring and helping resolve countries' economic problems before they reach the crisis stage....

"Bankers want the IMF to be a permanent overseer of its member's economies...." (*Institutional Investor*, September 1977, pp. 35, 36, 40.)

The Evolution of a Global Management System

In an article entitled, "International Economic Policy as a System," Henry Fowler, former Secretary of the Treasury and investment banker, outlined the global management system that is evolving and the role of the IMF in it. He stated that:

"World peace and prosperity and the common interests of all nations will be served by preserving and improving the multilateral, open, and expanding international economic order which has evolved in the last twenty-five years.

"This is as true for the developing as well as the developed nations, for those with socialist or mixed economies as well as those more oriented to private enterprise. It is even more true for the peoples in all nations and parts of the planet who suffer from poverty, hunger, unemployment, underemployment and a lack of economic opportunity as well as those who live in relative affluence and security.

The Call for a More Integrated Cooperative Management System

"Even before the current crisis began on August 15th, 1971, which laid bare the cracks and flaws in the existing structure, it was recognized by many that the methods of loose and more often than not ad hoc consultation through which international economic policy had been developed and executed were no longer adequate. There were prescient and eloquent calls for a more effective and integrated cooperative management of the international economic order.

"But today that system is threatened with a tragic breakdown or, at least, a dangerous paralysis that makes it highly vulnerable if the foreign exchange and gold markets of recent months are any sign. Retreat, to the accompaniment of continued neighbor tactics, narrow nationalism, neo-isolationism or retrogressive regionalism seems as likely as advance into an improved and modernized system of international cooperation.

The Need for a Community of Nations

"What is needed is an open community of nations which is dedicated to a systematic and orderly utilization of international economic policy for the common good. This will involve a far more broadened application than we have yet witnessed of the principle of a limited pooling of sovereignty in specific areas of economic decision making that substantially affect the world economy.

The Increasing Interdependence of Western Europe, North America and Japan

"The increasing interdependence of the nations and economies and peoples of Western Europe, North America and Japan is an important basis for this economic order. Their shared values, similar patterns of political and economic organization and conduct, and common economic objectives are sufficiently compatible to ground a high degree of consultation and collaboration. Their institutionalization of this cooperation in many private as well as governmental organizations in trade, monetary affairs, financing and capital movements, international investment and development, tourism and general economic policy is the nucleus of a vast and progressive international economic system. Its promise for the remaining decades of this century is as great as the progress of the past.

A Declining National Orientation of Economic Behavior

"This interdependence is the fruit of success. Vast improvements in communication and transportation make the world constantly smaller in every sense but physical. The past success of international trade and payments arrangements since World War II has vastly increased trade, capital movements and the movements of people across national borders. International monetary and security markets now influence developments in national financial markets,

tending to tie them together. Interdependence has also grown outside the areas of trade, financial flows and movements of people across boundaries. Businesses increasingly look beyond national boundaries. So-called multinational companies lead to a declining national orientation of economic behavior, at least within the developed countries.

Economic Interdependence Circumscribes National Freedom

"This economic interdependence circumscribes national freedom to pursue widely divergent economic policies without sensitivity to their impact on other countries. These impacts become increasingly important. The technological progress that has made the spaceship possible has brought home the elemental truth that our planet is but a spaceship and we are all its passengers.

"This fact and the concept on which it is founded brings a degree of global interdependence that surely gives rise to the necessity for international economic and financial cooperation in the future, far beyond what we have had in the past. But this promise of the future is not a mere dream, for it is founded on the reality of past accomplishments.

The Momentum of Past Accomplishments

"Already the momentum of these past accomplishments requires many ongoing activities – a persistent improvement of an international monetary system, a continuing assault on non-tariff barriers, a multilateral de-escalation of restraints on international capital movements, an expanding scale and efficiency of use of multilateral assistance by the developed countries to the less developed countries, a proper balance between national interests and the multinational corporation that will give the latter an opportunity to play its important role in international economic development

Areas Ripe for International Economic and Financial Cooperation

"But other areas and opportunities for international financial and economic cooperation do not necessarily flow from past experience and do not have the advance of momentum from the activities of well established international institutions that dot the international monetary landscape. To seize these opportunities requires imaginative leadership, original action, and new international economic policy as well as national decisions by sovereign political authorities. Some of these newer challenges and opportunities where international economic and financial cooperation can play a decisive role are as current as today's newspaper. For example:

"The protection of the environment,

"The mining and utilization of the resources under the oceans,

"A meaningful adjustment of excessive population growth to available resources, and the planets ability to provide an adequate minimum quality of life,

"The utilization of space for communications, weather monitoring and other services to this planet,

"And the development and utilization of various forms and resources of energy to serve men's needs.

"In all these and many other areas science, technology and progress have given to men and governments opportunities undreamed of at the end of World War II. But, as yet, the processes of government and statecraft have not yielded an equivalent capability.

"We must recognize that the primary cause of this long recognized inadequacy of present methods of formulating and executing appropriate international economic policy and the existing crisis is a structural deficiency. We do not have a system capable of translating mutually advantageous international economic policy into meaningful and timely reality.

A Mission of the Elite

"A mission of ours should be to identify some of the pressing tasks at hand for international economic policy and to stimulate the exercise of political will in our respective countries to forge the tools adequate to perform those tasks in a systematic fashion.

Some Pressing Tasks for International Economic Policy

"There is a first and fundamental step in assuring a more effective and systematic use of international economic policy. It is the urgent and timely transition from the existing pattern of disorderly drift into separate monetary and trading blocs and a world of floating exchange rates to a modernized but truly international monetary system.

The Need to Expand the Range and Force of International Decision Making on Monetary Affairs

"This system must not abandon but build upon the Bretton Woods Agreement and the principles it embraces. The objective should be to strengthen the International Monetary Fund by expanding the range and force of international decision making on monetary affairs, and by making the structural adjustments necessary to make the institution equal to these new responsibilities.

"The Amendments to the IMF Articles of Agreement should provide for a suitable degree of flexibility in exchange rates and a more effective balance of

payments adjustment process. This process should apply equally to surplus as well as deficit countries. There must be no lasting abdication of national responsibilities to defend stable exchange rates appropriately determined under rules of common application and to insure a proper degree of official convertibility. The system must provide adequate reserves, internationally acceptable and usable, and supplementary sources of international credit to facilitate these stabilization processes while adjustment to equilibrium is achieved without damaging internal economic acts or restrictions on trade and useful capital movements.

Strengthening the IMF

"These and other necessary measures call for upgrading the International Monetary Fund to the status and function of a World Central Bank, rather than allowing it to become an obsolete monument to a noble past. They call for an intensification of international cooperation rather than forsaking it to rely upon so-called market forces and inward looking national decision making on matters that affect the peoples of other nations.

The Consolidation of the Monetary Systems of All the Nations

"The effective consolidation of the monetary systems of all the nations represented here and many others not represented is indispensable to the tasks that confront an international economic policy that will be truly responsive to the world's needs in the last decades of this fateful century.

"While we can all rejoice at recent progress toward European monetary unification, its ultimate achievement must not be accepted as an alternative or substitute for a viable international monetary system.

"The special role of the dollar as a reserve currency is no longer a barrier to a truly multilaterally operated and internationally governed system based on internationally created reserve assets. There seems to be fairly general agreement that, in a new viable and symmetrical system, balance of payments settlements in the future should be through conversion of officially created international reserve assets rather than the random accumulation of officially held national currencies.

"The United States has expressed its willingness, after a suitable transition period and upon achieving a 'demonstrated capacity' in terms of its reserve and balance of payments position, 'to undertake an obligation to convert official foreign dollar holdings into other reserve assets as a part of a satisfactory system.' It seems clear that a prerequisite for the establishment of this system will be some funding, multilateral or bilateral, of existing official reserves of foreign currencies, be they dollars, pounds or francs.

Efforts of the Committee of Twenty Should Be Supported

"The current efforts of the Committee of Twenty of the International Monetary Fund should be supported and invigorated. Recent events highlight the urgent importance of an act of political will by the governments most involved, at the highest levels, if these negotiations are to achieve the end immediately and urgently required. That end is the development of a financial institution through which the principal industrial nations can together manage their reserves and harmonize their economic policies in a manner consistent with a constructive international economic policy.

"A rather large area of potential agreement on these and other related questions was reflected in the observations of Ministers of Finance and Governors of central banks at the annual meeting of the International Monetary Fund in September when the Committee of Twenty was established to conduct formal negotiations.

Strengthening the Ties That Bind Us

"However, we must not blind ourselves to the possibility that national decision making in the ensuing negotiations may fail to achieve multilaterally agreed decisions that strengthen the ties that bind us.

"Or unplanned or unexpected events such as the ones recently witnessed on the world monetary scene may overtake the negotiations, causing them to be down played, deferred, strung out or ultimately abandoned, leading to the acceptance of the easy way out – a permanent acceptance of so-called market determined floating rates. This course dispenses with meaningful international cooperation in either the adjustment process or the creation and management of reserves – except on a regional basis.

"Consequences of failure in either of these scenarios might be to dismantle or greatly diminish the effectiveness of any truly international monetary system, encourage protectionism and trade wars between blocs, refasten more tightly controls on capital in the manner of the old pre-war exchange control systems of Europe and weaken or drastically alter the alliances that have served the cause of peace and prosperity since World War II.

"The world simply cannot afford the risks implicit in another major failure of international economic and financial cooperation such as marked the Nineteen Thirties. Every effort must be summoned to maintain the momentum that began in the wake of battle when a war torn generation had learned a bitter lesson.

The IMF, IBRD and OECD Have Developed the Principles for Guidance of the International Economic System

"In the International Monetary Fund, GATT, the International Bank for Reconstruction and Development and the Organization for Economic Cooperation and Development there have been developed principles, policies and precedents which lay a foundation for dealing with many related tasks of the international economic policy of the future.

"The stabilization and revitalization of the international monetary system is a condition to success in every other field of international economic policy, such as trade policy, appropriate relationships and assistance to developing nations, and suitable arrangements with nations where state trading is the current rule.

Strengthening the International Monetary System

"The current negotiations of the Committee of Twenty to restore and update a functioning monetary system should, therefore be both a proving ground and a beginning for institutionalizing and systematizing a cooperative management of the international economy which has developed in Western Europe, North America and Japan in the last 25 years.

"For example, it will not be enough to satisfy contemporary views of wise international economic policy to modernize the Bretton Woods system in the particulars already discussed. The negotiatory momentum which that process generates should carry over into related negotiations designed to remove restrictions and discrimination in the field of international trade and investment. There should be a systematic prevention of the use of controls on trade and long term capital movements to maintain a chronically misvalued currency or to provide long lasting protectionism for an economy that is not being subjected to an effective adjustment process.

The Importance of GATT

"The importance of making a beginning on detailed trade negotiations under GATT this year is generally accepted. Results can be of great benefit to the international economy, but the end for action in that trade field is not dictated by economic considerations alone. There is a serious danger that if conditions are not provided for a continued expansion of world trade and a lowering of both tariff and non tariff barriers for the benefit of nations generally, we may all face trade conflicts and jeopardy to the progress already made, with possible damage to Atlantic relations and those with Japan.

Breaking New Ground at the International Level

"These trade negotiations will have to break new ground internationally both as to substance and procedure.

"Because of the constitutional division of power between the Congress and the Executive in the case of the United States, the authorizing legislation should provide the Executive with authority to act when the objective can be readily defined. It should provide negotiating authority, subject to Congressional review in other cases, particularly those dealing with non tariff barriers enmeshed in domestic legislation.

The Call for Harmonizing of Policies at the International Level

"Dealing with these problems will inevitably be a long term continuing process, calling for negotiation, consultation and harmonization of policies on a continuing systematized scale.

"The same is true of the unique problems of agriculture. Nonetheless, it is essential that international trade in agricultural products be dealt with as an integral form of a world trade system, particularly as regard non tariff barriers, which are of great significance in this area. The Kennedy Round of negotiations was able to accomplish very little in this area, which is of particular importance to the United States in view of the efficiency of our agriculture and its role in our export trade.

"Agreements should be sought which would result in a substantial expansion of agricultural trade, particularly in view of the greatly increased demand that seems potential in Asia and the USSR.

Developing Internationally Accepted Rules of Good Behavior for Nation-States

"Another example of the need for pioneering efforts in systematizing constructive international economic policy is the need to develop internationally accepted rules of good national behavior to assure the liberalization and freedom of international investment flows.

"The result of an ambivalent and passive attitude toward controls on long term capital flows, both portfolio and direct, has been a maze of controls, many added in recent years to the pre-war hangovers of exchange control patterns, whenever a nation found itself with a balance of payments deficit. Sometimes these were maintained long after the deficit disappeared.

"The adjustment process should be directed toward encouraging international investment and open capital markets and controls on capital flows should not be

allowed to become a means of maintaining a chronically undervalued currency or avoiding an effective adjustment process.

Harmonizing Policies of Nation-States with Respect to Taxation of International Trade and Investment

"In addition to the removal of long standing barriers to international investment flows for balance of payments purposes, where the linkage is so close that the Committee of Twenty must deal with it directly, U.S. policy sees a need for supplementary measures. U.S. Secretary of the Treasury Shultz has urged that group to help launch serious efforts in other bodies to harmonize the practice of nations with respect to the taxation of international trade and investment, the granting of export credit, and the subsidization of international investment.

A GATT for International Investment

"The implications of these policy assertions for both direct and portfolio investment over national boundaries, as well as the world's capital markets, are tremendous, if this U.S. policy suggestion receives any encouraging response. A GATT for international investment becomes a probability.

"A sharp distinction must be drawn between long term capital movements in the nature of bona fide international investment, and certain short term capital movements which have played a very disruptive role as private parties in control of liquid capital move it from one currency to another in anticipation of substantial changes in currency values.

"These massive movements of short term funds, some as a result of currency crises, some actually producing a crisis, and all intensifying the crisis, make it not only desirable but necessary to institute some measure of multilaterally negotiated and administered control over these flows, particularly when they are disruptive and not consistent with the adjustment process and appropriate rate relationships.

A Modernized International Monetary System

"Of course, good economic policy, a modernized international monetary system and a working adjustment process are the major tools to minimize these disruptive flows. But there are bound to be occasions when abnormal and destabilizing short term flows will occur, absent some measures to control them. While there is probably no practical way to prevent all of them, there are various techniques which can be employed to moderate such movements of funds even in periods of great unrest. Perhaps the most fruitful approach is one that operates to repel inward flows when they are primarily responsive to speculation as to currency rate changes.

The Regulation of Inward Capital Flight

"In any regulation of inward capital flight, three important points should be stressed. First, there should be genuine multilateral agreement that these measures to control inward flows are desirable in general, that they are not used merely to prevent overdue parity changes, and that they will be employed in timely fashion.
